Exhibits 210, 212, 215 and 217 for identification are price reviews dated respectively March 21, 1936, February 14, 1936, January 24, 1936, and December 19, 1935, from P. E. Lakin to A. Fraser, written by me and signed
1617 by Mr. Lakin.

Mr. Chaffetz: I offer Exhibits 210, 212, 215 and 217 in evidence on the same conditions, and I assume over the same objections.

The Court: Yes. They may be received. Exception allowed.

(Documents referred to received in evidence as EXHIBITS 210, 212, 215 and 217 against all defendants shown by the record to be connected with the alleged conspiracy. Later at R. p. 907 said exhibits were admitted as evidence against all defendants generally.)

Exhibit 220 for identification is a memorandum dated January 2, 1935, from the Crude Oil Department to Messrs. Fraser, Bascom and Lakin, signed by A. P. Ruether. The writing in lead pencil on the upper portion of the left hand margin appears to be Mr. Fraser's writing. It is addressed to Mr. Ruether, and it looks like "please discuss." They appear to be Mr. Fraser's initials, A. F. "Spoke to Mr. Fraser 1/3/35 p.m." appears to be in Mr. Ruether's handwriting. "Think we should participate up to 10 cars." is apparently Mr. Lakin's. I am not sure, but I believe the initials just below Mr. Lakin's writing are Mr. Ruether's. I cannot be sure they are not Mr. Fraser's initials. I am rather inclined to believe they are Mr. Ruether's initials.

Mr. Chaffetz: This Exhibit 220 I offer as against the Shell Petroleum Corporation and Mr. Fraser
1618 and Mr. Lakin only.

Mr. Donovan: Same objections as appear at R. pp. 504-05, 556-57, 721-23.

The Court: It may be so received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 220 against Shell Petroleum Corporation, Alexander Fraser and P. E. Lakin only.)

Exhibit 221 for identification is apparently the original of a telegram dated August 26, 1935, from Kilgore, Texas, to A. P. Ruether, St. Louis, from G. L. Shoemaker.

Mr. Chaffetz: Exhibit 221 offered on the same conditions as Exhibit 218, and the preceding exhibits were offered, that is, as against the defendants generally whom the record may show have been connected up with the conspiracy.

Mr. Donovan: Same objection as appears at R. pp. 504-05, 556-57, 721-23.

The Court: It may be so received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 221 against the defendants stated. Exhibit 221 later at R. p. 907 was admitted as evidence against all defendants generally.)

Exhibit 232 for identification is a carbon copy of a letter dated May 17, 1935, written by myself, signed by
1619 Mr. Lakin, and addressed to Mr. A. V. Bourque of the Western Petroleum Refiners Association. The fact that that carbon was in our files would indicate that

the letter was sent to Mr. Bourque on that date. On it there is some writing in ink, "mailed May 20." That is not my writing.

Mr. Chaffetz: I offer Exhibit 232 in evidence on the same basis as the preceding exhibit.

Mr. Donovan: Same objections as appear at R. pp. 504-05, 556-57, 721-23.

The Court: It may be received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 232 upon the basis stated. At R. p. 907 Exhibit 232 was admitted as evidence against all defendants generally.)

Exhibit 235 for identification is apparently a carbon copy of a report, originating in the Manufacturing Department, headed "Review of Gulf Coast Bulk Market, Week Ending April 6, 1935." There is a rubber stamp, C. E. Davis. Mr. Davis is, I think, assistant to the manager of the Manufacturing Department. This document was addressed to Mr. A. Fraser. The date it was written is not perfectly clear. It might be April 9, 1935.

Mr. Chaffetz: I offer Exhibit 235 in evidence, on the same basis as the previous exhibit.

Mr. Donovan: Same objections as appear at R. pp. 504-05, 556-57, 721-23.

1620 The Court: It may be so received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 235 upon the basis stated. At R. p. 907 it was admitted as evidence against all defendants generally.)

Exhibit 240 for identification is an original letter from Mid-Continent Petroleum Corporation, dated December 19, 1935, addressed to P. E. Lakin, signed apparently "R. W. McDowell." I don't know Mr. McDowell's signature; that is what it appears to be. I think this notation to Mr. Ruether is Mr. Lakin's handwriting. It is "To note as per conversation McDowell informed you will be there." The initials are "P. E. L." Those initials are the initials of Mr. Lakin. It is my belief that the other set of initials are Mr. Ruether's. Just below the body of the letter, appears "Noted," and I think it is followed by Mr. Ruether's initials.

Mr. Chaffetz: I offer Exhibit 240 in evidence on the same basis as the preceding exhibit.

Mr. Donovan: Same objections as appear in the record at pp. 504-05, 556-57, 721-23.

The Court: It may be so received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 240 upon the basis stated. At R. p. 907 it was admitted as evidence against all defendants generally.)

Exhibit 246 for identification is a copy of a letter 1621 from the shipping and supplies department, to the crude oil department, dated October 3, 1935, with a copy to myself, in connection with market stabilization gasoline purchases. It was written by a clerk in the shipping and supplies department, whose name is Kieselhorst, I think. That handwriting might be Mr. Lakin's initials, although I am not sure of that. It looks like "P. E. L." The stamp, "Please return to P. E. Lakin's file," would lead me to believe that my interpretation of those initials is fairly correct.

Mr. Chaffetz: I offer Exhibit 246 in evidence on the same basis as the preceding exhibit.

Mr. Donovan: Same objections as appear in the record at pp. 504-05, 556-57, 721-23.

The Court: It may be so received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 246 upon the basis stated. At R. p. 907 it was admitted as evidence against all defendants generally.)

Exhibit 250 for identification is an original memorandum from the crude oil department, dated March 6, 1936, signed by Mr. Ruether, quoting an East Texas scout's report of March 4th. The pencilled handwriting is apparently Mr. Lakin's handwriting. It says "For the next tank car meeting I will give you date."

Mr. Chaffetz: I offer Exhibit 250 in evidence on the same basis as the preceding exhibit.

1622 Mr. Donovan: Same objections as appear in the record at pp. 504-05, 556-57, 721-23.

Mr. Morgan: We make the special objection to that exhibit, if the Court please, that it shows on its face to be based on a scout report. The scout is not charged in this indictment with being a party to this conspiracy; it is hearsay, by a third person, concerning facts, and in which a number of the defendants are named, stating the mere fact that they purchased gasoline, and it is not admissible for any purpose against the clients we represent,

Mr. Chaffetz: If your Honor please, the letter shows on its face that it is based only in part on such a scout report. In addition, it contains a list of major company purchasers in East Texas, and that does not appear from the face of the document to have come from the scout report. But, in any event, this is a memorandum from A. P. Ruether, who is the head of the Crude Oil Department, is he not, of the Shell Petroleum Corporation?

A. Yes.

Mr. Chaffetz: To Mr. P. E. Lakin, a defendant in this case, a member of the Tank Car Committee; and apparently Mr. Lakin intended that this should be used in connection with the next meeting of the 1623 Tank Car Committee. He says, "For next tank car meeting I will give you date."

The Court: Objection overruled. Exception allowed.

> (Document referred to received in evidence as EXHIBIT 250 upon the basis stated. At R. p. 907 it was admitted as evidence against all defendants generally.)

Mr. Thomas: In order to complete the record, your Honor, as they are all received, I assume that they are all received subject to the same objections that we made when the first offer was made, and subject to the same rulings?

The Court: You are correct. That is right. Exceptions allowed.

Mr. Lewin: May it please the Court, Exhibit 291, marked for identification, has at the top in pencil a check mark, and on the side in pencil the initials "E L S." The exhibit purports to be a report or weekly market letter No. 8, from defendant J. W. Warner of the Tide Water Company, to Mr. J. D. Collins of Tide Water Company, dated February 22, 1936.

May it be agreed and stipulated by and between counsel for defendant Edward L. Shea and counsel for the Government that that pencil check mark is the check mark of Edward L. Shea; that the initials "ELS" signify that this letter, Exhibit 291, was brought to the attention of Edward L. Shea and read by him; and is it further stipulated that Mr.

1624 Parsons, Harold Parsons, if recalled to the stand would so testify; and that Mr. Shea waives any confrontation of Mr. Parsons on that point?

Mr. Webster: It will be conceded or stipulated that the witness Parsons, if recalled, would testify that the appearance there of the initials "ELS" indicate that Mr. Shea saw this particular market letter.

Mr. Lewin: Then I offer this Exhibit 291 in evidence.

Mr. Donovan: Same objection.

The Court: It will be received. Exception allowed.

Mr. Lewin: As against defendants Shea and Warner.

(Document previously so marked for identification is received in evidence as EXHIBIT 291.)

(Mr. Chaffetz read Exhibits 169 and 170 to the jury.)

Mr. Beatty: Please the Court, and Mr. Lewin, those references to Phillips mean the Phillips Petroleum Company. That can be stipulated, I think, throughout these documents, and for the record.

The Court: Yes.

Mr. Lewin: I so understood it.

1625 (Mr. Chaffetz read Exhibits 173, 174, 175, 176, and 177 to the jury.)

Mr. Zwick: May I ask counsel for the Government if the Karstedt referred to in Exhibit 177 which was read, is E. S. Karstedt, a defendant in this case, but not on trial at this time on account of illness?

Mr. Chaffetz: I assume that is so.

Mr. Zwick: And I assume you will stipulate he was vice president of Continental Oil Company at the time that this meeting was held?

Mr. Chaffetz: That is true.

(Mr. Chaffetz read Exhibits 178 and 179 to the jury.)

Mr. Francis I would like to ask the Court to instruct the jury not to consider any references in that letter to the defendant, Mr. McElroy, who has not in any way been identified, even remotely, in connection with any of these programs as yet that I know of.

The Court: For the present, it will be admitted. Objections overruled. Exception allowed.

(Mr. Chaffetz read Exhibits 180, 181 and the first four paragraphs of 182, except for the quotations, and the second entitled "Gasoline" of Exhibit 183, except for quotations.)

(Mr. Lewin read the sections of Exhibits 184, 185, 186, 187, 188 & 189, entitled "Tank-Car markets", except for the quotations.)

1626 (Mr. Lewin read Exhibit 220, the parts of Exhibit 235 entitled "Gasoline", except for quotations, Exhibit 232, and the parts of Exhibit 194 entitled "Tank Car Markets", except for quotations, and most of retail prices.)

No Cross-Examination.

1627 E. M. KELLY, a witness for the Government, testified as follows:

Direct Examination by Mr. Chaffetz.

I am employed by Phillips Petroleum Company, Bartlesville, Oklahoma, where it has its operating office, and where I reside. I have been connected with Phillips Petroleum Company for 12 years. From July 1, 1934 to date I have been assistant to the assistant sales manager, Mr. H. A. Gardner, a defendant in this case. Since March 1, 1931 he has been assistant to the sales manager, Mr. A. M. Hughes, who is in charge of all tank car sales, wholesale sales. I think Mr. Hughes has held that position since July 1934. Mr. Hughes is a defendant. My work in that connection has been in the operating office of Phillips Petroleum Company. I spend about 50% of my time in the office, and 50% out in the territory.

Mr. F. L. Koopman, a defendant in this case, is also assistant to H. A. Gardner. His position coordinates 1628 and is parallel with mine; he does not report to me. He has something to do with the purchase of gasoline. I don't know if he is termed an official or not. He is the employee who does the buying. I don't know whether he buys all the gasoline that our company buys. I am not familiar with the buying end of it.

In 1935 and 1936, the superior to A. M. Hughes was H. A. Trower. His official title was vice-president in charge of marketing. Mr. Trower was not active throughout 1935 and 1936 due to illness. I don't know if Mr. Hughes acted as vice-president or not, but he, as far as I know, handled the functions of that office in place of Mr. Trower.

I am not entirely familiar with what department of our company the purchase of gasoline came under during 1935 and 1936. I think that the sales department handled the purchasing of gasoline, and probably synchronized with the manufacturing department. At least they conferred with them.

There is an operating committee in our organization. During that period the treasurer of the company was chairman of the operating committee, and the assistant to the president, and the following were members: vice-president in charge of production; vice-president in charge of land and geology; vice-president in charge of traffic; vice-president in charge of natural gas and natural
1629 gasoline; the comptroller; chief engineer; vice-president in charge of economics; vice-president in charge of marketing; and vice-president in charge of refining.

I don't know whether A. M. Hughes acted in the stead of H. A. Trower on that committee in 1935 and 1936, never having been in that committee meeting, but I assume that he did.

The operating committee meets irregularly, but averages about 4 meetings per week. It is subject to call at any time when business requires it.

We also have an executive committee. During that period the members of the executive committee were the president of the company, acting as chairman, the senior vice-president and general counsel, assistant to the president, vice-president in charge of research, and another vice-president at large. The executive committee meets irregularly, but on an average of 3 times a week.

Frank Phillips, a defendant in this case, is the president of the company. He is chairman of the board and chairman of the executive committee. I would say he was active in the affairs of the company during 1935 and 1936. His residence is in New York. We also have an executive office in New York City. Mr. Phillips divides his time about 50-50 between the operating office and the executive office.

1630 During 1935 and 1936, and prior to the time that this case commenced, I knew of a concerted buying movement participated in by major oil companies for the purchase of gasoline in the Mid-Continent area. I didn't know that our company was participating in any agreement or understanding on a program. We had been purchasing gasoline regularly since 1931, and I read in the various publications with regard to certain meetings and arrangements on buying, but I had no knowledge of what our participation was in it.

Cross-Examination by Mr. Donovan.

Our company manufactures and sells natural gasoline. Natural gasoline is manufactured from natural gas which is produced along with the crude oil, and is taken off and separated through separators in the field. That gas is pulled in by vacuum pumps into a plant. We may have 15 or 16 miles of collecting lines. They pull that in and run it through a compressor and manufacture natural gasoline, which is a more volatile product than gasoline made from crude oil. The plant that the natural gasoline is made in is a differently designed plant entirely than the ordinary refinery.

Natural gasoline is used generally to blend with cracked gasoline to give it more volatility. Generally it is not
used directly as a motor fuel, but there are cases
1631 where factionated, stabilized natural can be used as
a motor fuel.

26 pounds denotes the vapor pressure of the gasoline, and in the industry it commonly is known as a 26-70. 26 pounds vapor pressure is taken; that would equal 26 pounds per square inch at 100 Fahrenheit temperature. That is a test that they make to denote the vapor pressure of the gasoline.

There is a separate market for natural gasoline. The trade papers carry separate quotations. The Chicago Journal of Commerce does not carry a market on natural gasoline. The Platt's Oilgram carries a separate market.

The only business of Warren Petroleum Company and Hanlon-Buchanan Company, named in Exhibit 510, is the manufacture, purchase and sale of natural gasoline. Lone Star Gasoline Company is in the same business, but I am not so familiar with its operations.

Our company has a terminal at Houston, Texas. It is not used for the handling of motor fuel, but is used exclusively for the shipment and terminaling of natural gasoline. The designation "No. 26" in Exhibit 510, is the 26 pounds that I referred to. That is never referred to as No. 26, to my knowledge.

I know our company was purchasing refined gasoline in tank cars in 1935 and 1936, but I had no knowledge of the details, who it was purchased from, or prices, or anything.

1632 Our company's production of refined gasoline, has increased each year that we have been in the business, including 1935-1936.

The increase in 1934 over 1933, including natural gasoline, which was blended with the refinery-produced gasoline, was 519,888 barrels. That was equal to slightly in excess of 5%.

In 1935 over 1934, including the natural blended, the increase amounted to 1,001,066 barrels. That was equal to an increase of 9.3%.

In 1936 over 1935, including natural blended, the increase amounted to 519,137 barrels, equal to an increase of 4.4%.

From the correlational reports and reports from the manufacturing department, our company's refineries have continuously operated at capacity; in fact, in the last year or so, we have actually run in excess of our capacity.

As to whether our company sells any substantial portion of its gasoline through jobbers, our percentage of total gasoline sales in 1935 amounted to 32.8% of the total. And in 1936, it amounted to slightly over 40%; and in 1937, the first 10 months, it was 44% of the total. We think that those jobbers furnish an outlet for gasoline which is essential to our company. Less than 1% of our company's jobbers have gone out of business in the last 5 years.

1633 *Redirect Examination by Mr. Chaffetz.*

When I said that our company or our refineries sometimes operated in excess of capacity, I meant that they have a normal capacity, which would be a safe operating capacity and we have actually run over that line. We could do that for a short period of time, but we couldn't continue to do that, because something would blow up. Every so often in refining, you have to shut down one still and work on it. We have been running these consistently, right straight through, which would reflect about 110% capacity, based on that safe capacity range.

Around a refinery, they are usually doing a lot of repair work. You have certain units shut down, and the capacity of a refinery would vary. With the same plants, our capacity might vary a good deal during the same year. I am not an expert on refinery operations, but our position has been that our sales have been running at such an increase that we have been compelled to keep our plants running right up to capacity.

We might have a variation of as much as 10% during a particular year in the same plants with respect to the capacity of those plants, because we have increased our facilities to the point where we have increased our capacity by 10% or more.

The jobbers with whom our company does business 1634 are located in 18 states. The principal operation is in the northern section of the country. Most of our jobbers are in the Standard of Indiana territory.

Cross-Examination by Mr. Lawton.

I have no figures to show the proportion of sales to brokers by our company in 1935 and 1936. Of our total sales, I would say 1% went to brokers in 1935. It would be less than 1% in 1936.

Recross Examination by Mr. Donovan.

I think I have a record of our total shipments in each year, from 1931 through 1936. The total sales in 1931 amounted to 8,038,748 barrels; in 1932, 9,434,943 barrels; 1933, 10,215,431 barrels; 1934, 10,973,608 barrels; 1935, 11,768,305 barrels; 1936, 12,721,646 barrels. In the 10 months of this year, it has increased approximately 13% over 1936.

1635 E. McCLURE ROUZER, a witness for the Government, testified as follows:

Direct Examination by Mr. Chaffetz.

I live in Baltimore, Maryland. I have been associated with Mid-Continent Petroleum Corporation as secretary since it was organized in 1917, and as vice president since about 1929. I am also a lawyer.

The principal office of Mid-Continent Petroleum Corporation is now and was during 1935 and 1936 located in Tulsa, Oklahoma. We have an office in Baltimore for the payment of dividends, where Mr. France and myself have our offices.

There are two Mid-Continent Petroleum Corporations: Mid-Continent Petroleum Corporation of Delaware which is the producing, refining and marketing company; and prior to 1937 we had a Mid-Continent Petroleum Corporation of Kentucky, which was a marketing company. The capital stock of the Kentucky company was wholly owned by the Delaware company. The Delaware company did all the producing and refining. I believe foreign business was done direct with the Delaware Company. The company that marketed in the Standard of Indiana territory was the Kentucky company.

The Kentucky company did not have the same officers as the Delaware company. Jacob France was presi-
1636 dent of both companies. George O. Moody, J. C.
Denton, F. B. Coomtz, and R. W. McDowell were vice presidents of both companies. I am vice president and secretary of the Delaware company and also assistant secretary and assistant treasurer of the Kentucky company. Charles Klein was treasurer and assistant secretary of the Delaware company and was secretary and treasurer of the Kentucky company. A. D. Kneale was an assistant secretary and assistant treasurer of both companies. Jess Scorborough was elected vice president of the Delaware company August 4, 1936, but was not an officer of the Kentucky company. E. F. Lawrence was an assistant secretary and an assistant treasurer of the Delaware company but was not an officer of the Kentucky company. J. T. McDonnell was not an officer of the Delaware company, but was an assistant treasurer of the Kentucky company.

I don't consider myself an operating man. Mr. Scorborough is an operating man and is vice president in charge of the Land and Geological Departments of the Delaware company, but has no position with the Kentucky company. Otherwise the officers are the same, except as I have stated.

In those instances where the officers are the same, during 1935 and 1936, the salaries were pro-rated between the two companies except in the case of Mr. Mc-
Dowell. He was paid in full by the Kentucky com-
1637 pany. The salaries were paid by the Delaware com-
pany and then pro-rated in the bookkeeping depart-

ment, except as to McDowell's salary and I don't know how that was handled.

The directors of the two companies were not the same. The board of directors of the Delaware company had a membership of 14. There were 3 directors in the Kentucky company. They were Mr. Klein, Mr. France, and myself. Mr. Jacob France, a defendant, was the only operating man who was on the board of directors of the Kentucky company. At that time he was president and chief executive officer of the Delaware company, and actively in charge of the affairs of the company in 1935-1936.

Our company did not have a general manager. The only other executive officers besides Mr. France were these vice presidents. They were in charge of separate departments. The production department was headed by George O. Moody; the legal department, by J. C. Denton; the refining departments, by F. B. Coemtz; the marketing department, by R. W. McDowell, who is a defendant in this case; and the land and geological departments, by Jess Scorborough.

Our company during 1935 and 1936 did not have any executive committee or operating committee. The various vice presidents had complete charge of their departments. They reported to the board of directors through the president; occasionally one of them would attend
1638 a board meeting.

Mr. France has a general supervision. There is a provision in the by-laws that, subject to the control of the board of directors, he has general supervision over the affairs of the company.

Mr. France lives in Baltimore. He is in the chief office of the company at Tulsa part of the time. He spent 102 days in Tulsa in 1935, and 91 days in 1936. When in Baltimore, he receives reports of the department heads in the Tulsa office, and is in communication with them by telephone and otherwise.

Exhibit 339 for identification is a letter written on the letterhead of Mid-Continent Petroleum Corporation, the stationery of R. W. McDowell, vice president. Mr. McDowell's signature is on the letter.

> Mr. Chaffetz: I offer EXHIBIT 339 in evidence, generally, against the defendants whom the record may show have been connected up with the conspiracy charged by the Government.
>
> Mr. Thomas: We object, on behalf of all the de-

fendants in the case, to the reception of this exhibit, on the same grounds and for the same reasons as heretofore stated, relative to reception in evidence of Exhibits 334, 335 and 336, and for the same reasons and on the same grounds as assigned to the reception of Exhibit 287, and the other documents designated by the prosecution as being pro-
1639 duced pursuant to subpoena from the Shell Company file. These objections are at R. pp. 504-05, 556-57, 721-23, 786.

The Court: Objection overruled. It may be received. Exception allowed.

(Document referred to received in evidence as EXHIBIT 339 and read to the jury.)

Mr. Thomas: I move that the Court instruct the jury that the exhibit is not receivable in evidence against any defendant, corporation or individual, other than the writer of the letter.

The Court: Motion denied. Exception allowed.

I don't know what is meant by Q gasoline. Thomas E. Fitzgerald was assistant to Mr. McDowell during the years 1935 and 1936. He is a defendant in this case. Their offices are in Tulsa.

Cross-Examination by Mr. Donovan.

The principal departments of our company are headed by vice presidents, having complete control and discretion over their departments—practically like a separate organization,—who report at the end of the month to the president. The president also gets almost daily reports on products, refinery runs, sales and so on.

I have a copy of the by-laws which would denote the duties of a vice president. It reads:

1640 "Vice president or vice presidents shall perform the duties of the president in his absence or during his inability to act. Any action taken by a vice president in the performance of the duties of the president shall be conclusive evidence of the absence or inability to act of the president at the time such action was taken. The vice presidents shall also have such other and further powers and shall perform such other and further duties as may be assigned to them respectively by the board of directors."

By the Court

Those vice presidents run their respective departments whether the president is there or whether he isn't there. The president was abroad a month in 1935. I think it was in October. Except for that time, he was where he could be reached.

By Mr. Donovan

Mr. France was in Florida in 1935 from about the middle of January to the middle of February.

Redirect Examination by Mr. Chaffetz.

Each department is run by its department head, and they report to Mr. France for transmission to the board of directors, and keep him informed from time to time. He wants to know what his production is, and what his refinery is doing. At the end of each month he knows what the financial results of the operation of the company are.

1641 ROBERT L. BOSWORTH, a witness for the Government, testified as follows:

Direct Examination by Mr. Chaffetz.

I reside in New York City. I am associated with Continental Oil Company, defendant herein, as assistant secretary and assistant treasurer. I have been connected with that company and its predecessor, Marland Oil Company, since 1923.

The principal office of Continental Oil Company is now and was in 1935 at Ponca City, Oklahoma. My office is in New York City, where we have 3 employees, myself and an assistant and a stenographer. The majority of the operating officials of the company are located at the chief office of the company in Ponca City; there are about 3 who are not located in Ponca City.

The chief executive officer of our company during 1935 and 1936 was Dan Moran, a defendant in this case. He had been president since November, 1928, and during the period from November, 1928, to 1929, he acted as president of Marland Oil Company. Throughout 1935 and 1936, Mr. Moran was an active president of the organization and was actively in charge of the affairs of the company.

The company also has three executive vice presidents and one general manager, in charge of departments.

1642 W. H. Ferguson is executive vice president located at Denver, Colorado, in charge of the operations of the company in the Rocky Mountain territory, largely production. W. W. Bruce is executive vice president at Ponca City, in charge directly of service operations of the company, and serves as chief executive officer at that location, or as chief administrative officer. Walter Miller is vice president in charge of manufacturing; Harry J. Kennedy, vice president in charge of marketing.

Mr. Kennedy, a defendant herein, has been vice president in charge of marketing since May. From June, 1935, until the following May, he served as general manager in charge of sales. Prior to that he had been general sales manager for 3 or 4 years. The vice president in charge of marketing before Mr. Kennedy was E. S. Karstedt.

An executive committee serves in lieu of the board of directors at such times as the board does not meet. The president of the company is a member of the executive committee. It is scheduled to meet 8 times a year. None of the operating officials of the company, other than the president, are members of that executive committee. They are all outside directors, I would say, except the president.

The operating committee is composed chiefly of the vice-presidents and department heads and certain other key men, which meets each Tuesday.

1643 The purchase of gasoline is handled by the Order and Distribution Department, a division under the Marketing Department. That would be under Mr. Kennedy's department. L. J. Morgan is in charge of that division. He reports to L. T. Cramer, assistant to Mr. Kennedy and a defendant in this case.

Mr. Karstedt's resignation was effective June 1, 1935. Before that he was semi-inactive, and Mr. Kennedy then succeeded to substantially all his duties and functions but did not assume the title of vice-president until approximately a year later.

The president of our company has resided at Houston, Texas, where our company has an office, since the early spring of 1935. He spends a great deal of time in the field and on the road. Generally speaking, his time is divided between those two offices. Mr. Moran is an oil man and a mechanical engineer by training.

Cross-Examination by Mr. Donovan.

I do not recall of any year in which our company's production of gasoline has equaled refinery sales of those products. For that reason our company has pursued a policy of purchasing considerable amounts of gasoline each year. To my knowledge the company has purchased
gasoline in substantial quantities ever since in 1929
1644 from independent refineries.

The amount purchased each year between 1931 and 1934, both inclusive, would average around 1,300,000 barrels each year. Its purchases in 1935 would be slightly less than in 1934. Our 1936 purchases were less than 1935 or 1934.

I have a memorandum showing the approximate proportion of our total purchases of refined gasoline from independent refiners as follows: 17% in 1934, 19% in 1935, and 14% in 1936.

By the Court

I don't know what our production costs were per unit. What exact costs are in the manufacture of gasoline is a highly debatable point. I am not really qualified to answer whether we could produce our gasoline for less than we could buy it from independent refiners in 1935 and 1936.

I am at the present time more of a contact man for the New York Office. I handle most of the correspondence and personal interviews with stockholders. I prepare most of the statistical data on the financial condition of the company, and its over-all operating figures for directors' meetings. I also handle certain matters of insurance, banking and marine.

By Mr. Donovan

Our Houston office is altogether a land and pro-
1645 duction office. At the present time Mr. Moran spends
a majority of his time in Houston or that vicinity, in the field.

In our own organization we have three divisions: lands, which has to do with the leasing of all properties or prospective properties; physical, which determines the likelihood of those lands as being productive; and production, which carries out the actual drilling or exploitation of those properties. We have representatives of those operations or departments at Houston.

Redirect Examination by Mr. Chaffetz.

Our principal refinery is located at Ponca City, Oklahoma. We have other refineries at Denver, Colorado; Albuquerque, New Mexico; Florence or Artesia, New Mexico; Baltimore, Maryland; Glen Rock, Wyoming; Wichita Falls, Texas; Lewiston, Montana; and Farmington, New Mexico. Conoco is the advertising name of our housebrand gasoline.

I do not know whether any of the purchases of gasoline made by our company from independent refiners during 1935 and 1936 were made in connection with any major company buying program. I had no connection with the buying. I just don't know one way or the other.

I believe that Conoco gasoline, our housebrand gasoline, is sold to jobbers in the Standard of Indiana territory, and in Wisconsin, where the company has service stations of its own, but I don't know how many.

1646 **FRANCIS T. HOPP**, a witness for the Government, testified as follows:

Direct Examination by Mr. Lewin.

My residence is Tulsa, Oklahoma. I am secretary, treasurer and director of Skelly Oil Company, a defendant in this case. I have been connected with that company since May 1, 1923, and have been secretary and director since that date.

Skelly Oil Company was incorporated in August, 1919. It is engaged in the production of crude oil and in the refining of crude oil into gasoline and other petroleum products, and the marketing of those products. Its principal production is located in the Mid-Continent field. Its principal office is at Tulsa, Oklahoma. It has one refinery located at Eldorado, Kansas, with a crude throughput in 1935 and 1936 of 20,000 barrels a day.

The principal marketing territory of Skelly Oil Company for gasoline is the Standard of Indiana territory, together with some contiguous territory. The company maintains bulk plants in that territory and markets gasoline through jobbers, dealers and through its own service stations.

It markets gasoline in Wisconsin in the ways in which I have described. I could not tell whether it is through-

out Wisconsin or in any particular portion, how
1647 extensive it is. I don't know that we own any retail
marketing facilities in Wisconsin.

Skelly Oil Company has an interest in a gasoline pipe line, the Great Lakes Pipe Line Company. The Great Lakes Pipe Line originates as far south as Okmulgee and Muskogee, in Oklahoma; goes north to Tulsa, and through Kansas City, to Omaha, to Chicago on the east, and to the Twin Cities, Minneapolis and St. Paul, on the north. I am not familiar with the detail, but a branch line goes north to Minneapolis, and a branch goes over to Omaha.

Our company's interest in that pipe line in 1935 and 1936 was 15% of the whole. It has decreased a little less than ½% this year, and is 14.5% now. The other owners of the Great Lakes Pipe Line are: Continental Oil Company, Barnsdall Corporation, Mid-Continent Petroleum Corporation, Pure Oil Company, Phillips Petroleum Company, Texas Corporation, and Sinclair Refining Company.

The line connects with each company's refineries. Skelly Oil Company makes use of that pipe line in transmitting gasoline. Not all the gasoline that goes into that pipe is the same quality and material. A number of grades go into that pipe line. I am not competent to tell you how it operates. I don't know whether it is cheaper to transport gasoline by the Great Lakes Pipe Line than
it is to transport it by tank car over the railroad
1648 from Tulsa to points like Chicago. I presume it is.

I have known William G. Skelly, a defendant in this case, since 1921. He is president of Skelly Oil Company and has been since its incorporation. He presides at the meetings of the board of directors and was usually present, active and on the job, during 1935 and 1936. He is active in the operations of the company as well as in its financial side. His principal office is Tulsa, where he resides.

The company does not have a general manager so designated. I don't know what the functions of general manager are, but Mr. Skelly has charge of the company.

I have known the defendant, James Nagle, since 1921. In 1935 or 1936, he was in charge of the branch sales office of the company at Tulsa. His office was in the Skelly Building in Tulsa, in the same building with Mr. Skelly. I think Mr. Nagle had charge of making those purchases. Mr. Nagle now has the title of executive assistant, which he has held since November, 1936. Before that time and throughout 1935 and up until November, 1936, he held this other position that I have described.

I would not know, except as I would learn from records of our company, whether during 1935 and 1936 it made any purchases of gasoline on the spot market from independent refiners. Our records disclose what they purchased, and from whom.

1649 Our company has an executive committee. In 1935 and 1936 the principal functions of the executive committee were to receive and consider requests for capital expenditures proposed by the various operating departments, and inquire into the financial condition of the company, consider the company's prospects, and if necessary, to pass on those things. It did not receive reports from various other officials of the company with any regularity, or any schedule. Its functions were to do such things as the board of directors of a company would do. It was empowered to do everything that the board could do when the board was not in session, and it did that; pass on resolutions, lost stock certificates, and sundry other things. In general it concerned itself with the important affairs of the company.

By the Court

I don't know that Mr. Nagle did the buying from the refiners. It does not come under my jurisdiction, and isn't discussed in the directors' meeting. The buying was usually done down in Tulsa. He had charge of sales. The Tulsa office, that Mr. Nagle had charge of, was under the jurisdiction of the Kansas City office, which had charge of all marketing, including the Chicago, Minneapolis and Omaha offices. He was the man representing the company at Tulsa who did the buying and selling.

1650 *By Mr. Lewin*

I know Clara G. Gartman. She was employed by Skelly Oil Company during 1935 and 1936 in Mr. Nagle's office as an assistant or clerk.

William G. Skelly is a member of the executive committee and attends most of its meetings. That was true during 1935 and 1936. I couldn't answer whether during 1935 and 1936 he attended all the meetings of the board of directors. I think he attended most of them, perhaps not all of them.

The board of directors had no set regular meeting date. It had an annual meeting day, following the stockholders' meeting in October; but otherwise, it met on call or on notice. I can't tell you about how many times it met during 1935 and 1936.

We have no operating committee. The executive committee is scheduled to meet monthly, and did a pretty good job of it. All members of the executive committee are members of the board of directors.

Cross-Examination by Mr. Donovan:

When I was referring to the ownership of the Great Lakes Pipe Line Company, and I mentioned Barnsdall, I meant the Barnsdall Oil Company; I think that is the name of it now.

1651 The records of our company disclose that it purchased gasoline in 1935-1936. Our company purchased gasoline for years. I think they did that even when their production was enough to take care of the sales.

It has been the custom of the company to build inventories through the winter, to take care of the demand through the summer. We have always sold more gasoline than we produced.

The information that I have here, from the company's records, says that our company's production of gasoline exceeded its sales in 1931 by 65,526 barrels. Our purchases during that year were 162,288 barrels. I am quoting from records furnished me on all of these questions.

Our production exceeded our sales in 1933 by 55,275 barrels. We purchased 220,034 barrels that year.

Our production of gasoline in 1934 increased over our production in 1933. The percentage of increase is 8.2%. That increase was not enough to take care of our sales in 1934. Our sales exceeded our production in that year by 338,415 barrels. We purchased 253,766 barrels of gasoline in 1934. From the records, we drew on our stocks in 1934 in order to meet the necessity of our sales.

In 1935, our company increased its production of gasoline by 11.8%. This increase in production was not enough to take care of our 1935 sales. The shortage was 409,393 barrels. In 1935 our company bought 411,910 barrels of gasoline. How our sales balanced with 1652 our purchases, plus our production, in 1935, is shown on this schedule which was taken from the company's records. It was balanced within ½ of 1%. It was 5/100 of 1%.

In 1936 our company increased its production of gasoline over 1935 by 6.6%. I have no figures in November. The increase in production was not enough to take care of our sales. The shortage was 387,425 barrels. In 1936 we purchased 391,457 barrels of gasoline. Our sales balanced against our production in 1936, plus purchases, within 8/100 of 1%.

Of the 411,000 barrels that our company purchased in 1935, according to the records that I have, approximately 196,000 barrels, or approximately 47% of the total purchases was bought from independent refiners.

In 1936, of the 391,000 barrels that we purchased, 193,000 barrels were bought from independent refiners. That was slightly under 50% of our total purchases.

I do not know what percentage of the Skelly Oil Company's sales was made to jobbers in 1935 and 1936. I have the figures here for some prior years, and I know how we generally figured it. The percentage of jobber sales to all sales of gasoline, I have in 1931, 64%; 1932, 60%; 1933, 57%; 1934, 54%. We have always considered that we were selling 60 to 65% to jobbers, and the balance
through our own facilities. Jobbers provide our
1653 most important sales outlets.

Redirect Examination by Mr. Lewin.

I can't tell you the percentage our total purchases of gasoline were of our total sales of gasoline in 1935; I can give you the figures. The total sales, 4,455,645 barrels, and the purchases, 411,910 barrels. That is a little less than 10%.

In 1936, 4,678,920 barrels, sales; 391,457, purchases. That is something about 8%, I would judge.

Of those total purchases in 1935, there were 196,000 barrels, against 411,910—about 47% from independent refiners. In 1935, a little less than 5% of our total sales were purchased from independent refiners.

In 1936, a little over 4% of our total sales were purchased from independent refiners. This may include gasoline purchased under long-term arrangements, as well as gasoline purchased on the spot market. I would judge it includes all purchases of all kinds.

I couldn't tell you whether it includes exchanges. I know what some exchanges are, as the term is used in the gasoline business, but I couldn't explain. I think our company sometimes sells gasoline to another major company at one point, we will say, and takes in exchange
an equivalent amount of gasoline from that same
1654 major company at another point. I don't know
whether this includes any of that or not. These purchases, on the one hand, during 1935 and 1936, and our sales, on the other, may have large exchanges there that balance each other.

By the Court

I couldn't tell you how many bulk stations our company owned in the Standard of Indiana territory in 1936 or in 1934, and do not know how they are operated.

A bulk station is one where you unload a tank car at a time, and sell it out to tank wagons. We have our own bulk stations where we have tank car storage facilities and storage facilities for tank car lots, shipped in by tank cars, and retail it or wholesale it to dealers in tank wagons. We do the same thing a jobber does.

Recross Examination by Mr. Donovan.

I perform the function of liquidating the company's obligations, collecting its accounts and keep it in good credit standing with its banks and its vendors. I don't tend to the books, I supervise. And I have nothing to do with the production or refining end, except as I come in contact with it in the performance of those duties.

By the Court

I am not a member of the executive committee. I am secretary of the executive committee, and as such attend their meetings and keep the minutes.

1655 L. S. WESCOAT, a witness for the Government, testified as follows:

Direct Examination by Mr. Chaffetz.

I reside in Chicago, Illinois. I have been associated with The Pure Oil Company, a defendant, something over 12 years and have been a vice president since 1927 and secretary since 1932.

The principal office of the company is in Columbus, and the executive offices are in Chicago, Illinois. The affairs of the company are directed from the Chicago office. We have a large number of executives of the company, and principal executives maintain their offices in Chicago.

The president of the company, Henry M. Dawes, is the head executive officer of the company. He is a defendant in this case. He was active in the affairs of the company during 1935 and 1936, probably to a lesser degree than he had been some time prior to 1933, when he became a member of the Planning and Coordination Committee, which took a great deal of his time in Washington; and that continued up until June of 1935. He was consuming a lot of time with the Planning and Coordination Committee during the first 6 months of 1935. I think his activity increased with the company after June, 1935.

He kept in pretty close touch—not specifically with the operation of the company—with the results of
1656 the operations of the company, during the period
June 1935 through 1936. He was regularly at his office during that period, with the usual visits out of town on business. He wasn't very often away on any extended trips, except for business trips and a vacation occasionally. I don't know what his salary was during that period, except to the extent I happened to see it in the public press. I don't handle the finances of the company. I am very sure he earned his salary that year. He worked very hard.

There are a number of executives of the company under Mr. Dawes. Each is charged with responsibility for individual operations in different departments.

C. B. Watson is vice president and in charge of refining, marketing. He supervises the operations of our transport group and similar operations which are under D. D. Irwin, consisting of our pipe line, steamships, inland waterways, crude oil purchasing, tank car operation and motor transport operations. He is also a director of the company. The purchase of gasoline would be a part of the function of his department. He would have authority over that subject. Mr. Watson has been connected with The Pure Oil Company since before 1923. I am not positive as to the exact period, but I would say that 20 years or more as of this time.

R. H. McElroy, Jr., in his department, had immediate responsibility of the subject of purchasing of gaso-
1657 line. He is also a defendant in this case. During
1935 and 1936, he was sales manager of the Wholesale Sales Department. Mr. McElroy's association with The Pure Oil Company preceded mine. I would think about 1924.

Our company does not have any general manager. The president doesn't have general supervision over all the operations of the company. That is broken down individually as between the various vice presidents and operating heads of those departments. There is no one man, with the possible exception of the president, who has jurisdiction over all of the departments. The president has jurisdiction over the heads of those departments, but he doesn't exercise the function of supervising those departments individually.

Cross-Examination by Mr. Francis.

In 1914 the Ohio Cities Gas Company was formed. In 1917 it took over The Pure Oil Company of New Jersey, which was a refining and marketing company, doing business on the Atlantic Seaboard. In 1920 it changed its name from Ohio Cities Gas Company to the name of The Pure Oil Company. As secretary of The Pure Oil Company, I have under my direct supervision the books and records of our company and I am charged with the responsibility for the accounting records of the company.

1658 In addition to being vice president and a member of the board of directors, I assist Mr. Dawes in such administrative matters as he may direct to me.

I have had prepared under my direction and at my request the record of The Pure Oil Company sales by months from 1931 through June, 1937; also, for the same period: figures showing the amount of gasoline manufactured from crude oil and natural gasoline in refineries owned by the company; figures showing the amount of gasoline purchased from independent refiners in East Texas and Mid-Continent areas, as well as the figures on all other gasoline purchased by our company, and records of the gasoline which was acquired by the company through processing contracts with other refiners. This statistical data has been illustrated by a graph.

Mr. Francis: The statistical data is the exhibit number; and the graph is "A" of that exhibit.

(Document referred to received in evidence as EXHIBIT 739.)

The total amount of gasoline The Pure Oil Company manufactured from crude oil and natural gasoline for the year 1931 was 485 million gallons plus. On this Exhibit 739, the exact figures are shown month by month. The Pure Oil Company manufactured 498 million gallons plus in 1933, and 463 million gallons plus in 1934. The total gasoline refined in 1935 was 527 million gallons plus,
1659 and 530 million gallons plus in 1936, and 293 million
gallons plus in the first 6 months of 1937.

We bought 320,022 gallons from independent refiners in the East Texas and Mid-Continent area in 1931, 8,201,594 gallons from sources other than independent refiners in the East Texas and Mid-Continent area. We purchased 449,985 gallons from independent refiners in the East Texas and Mid-Continent areas during the year 1932, and 11,912,029 gallons from others; 647,000 gallons from these independent refiners in 1933, and 31,336,900 gallons from others; 3,619,350 gallons from independent refiners in the East Texas and Mid-Continent areas in 1934, when the total of all our other purchases was 18,423,793 gallons. In 1935, we purchased 10,339,505 gallons from the independent refiners in these two areas, and 18,906,464 gallons from others; in 1936, 16,919,899 gallons from these refiners, and 23,205,085 gallons from others; and the first 6 months of 1937, 6,828,864 gallons from the refiners in the East Texas and Mid-Continent areas, and 12,602,076 gallons from others.

These processing contracts, and gasoline which was acquired under them, commenced in February, 1935. A gasoline processing contract as used by my company is a contract whereby another refiner processes crude oil for you which you supply at a fixed price per barrel, returning to you a fixed number of gallons of gasoline from each
1660 barrel, and in some cases a fixed number of gallons of by-products resulting from such refining process.

(From Exhibit 739 the witness reads the amount of gasoline derived by The Pure Oil Company through gasoline processing contracts, for February, March, April, May and June, 1935.)

That is in addition to purchases from independent refiners, and purchases made from other refiners than those in the Mid-Continent and East Texas fields. Those processing contracts or similar contracts are still in effect.

The total amount of gasoline which was acquired during the year 1935 was approximately 60 million gallons; approximately 79 million gallons during 1936; and in the first half of 1937, 45 million gallons.

By the Court

The highest amount acquired through processing contracts in 1936 in any one month was 9,921,507 gallons, in September. The lowest amount in 1936 was in January, which was 3,742,573 gallons.

Perhaps I should explain that these totals are not truly indicative of the monthly results, because sometimes there will be an over-lapping, and deliveries will be made early in a succeeding month on crude which has been supplied during the preceding month, and vice versa; so that it requires an over-all year's figures in order to get the total.

1661 *By Mr. Francis*

Our third source of supply, outside of our own gasoline manufactured in our own plant, was this gasoline derived under processing contracts; and deliveries under those commenced during the first few days of February, 1935.

I have had prepared the figures which show the gasoline inventory of The Pure Oil Company, commencing in January of 1931, and going down to July of 1937, both the total inventory and the number of days of available supply.

(Document handed to witness.)

That is the record which I have prepared from the books and records of the company.

(Document referred to received in evidence as EXHIBIT 740.)

I could tell the Court what the total gasoline inventory of The Pure Oil Company was at the end of any month which he desires to know about, from January, 1931 to June 1937. As an illustration, the total inventory, regardless of its availability, of The Pure Oil Company at the end of December, 1931 was 40,695,628 gallons. All of that inventory was not available for immediate sale.

A certain part of your inventory is what we call frozen. You at all times have in pipe lines, steamships, barges,
1662 a certain amount of gasoline that is constantly in transit. It runs in varying amounts, lighter during the winter, of course, heavier during the summer, at which time your sales are higher. And, in addition to that, you have what we call tank bottoms, which is gasoline in the bottom of tanks, below which what is known as swing line does not go. There is always a certain amount of water in the bottom of those tanks, which is condensation, and therefore you do not get your swing line within 4 or 5 feet of the bottom, because if you do you are apt to pump up a little of that water, which causes trouble in the gasoline. That also is a part of what we term frozen stocks. So that that part of your inventory which is in transit, in tank bottoms, and under similar situations, is not available for

immediate sale. The thing that is important, then, to any oil company, which is in the business of selling gasoline, when the matter of inventories is considered, is how many days of supply of gasoline there are available for shipment.

(The witness then discussed total inventory and sales figures appearing on Exhibit 740 for December, 1931, December 1932, December 1933, December 1934, December 1935 and December 1936.)

Our total inventories at the end of 1931 were running just about what our total monthly sales were running at that particular month. At the end of 1934, our inventory was less by 35,000,000 gallons than it was at the end of
the preceding year. For the months indicated, our
1663 inventories were substantially less in 1936 than in
1935, and our sales were up. During the year of
1936, our inventories declined 12,000,000 gallons.

In December, 1931, we had available for immediate shipment, 17 days supply; in 1932, 21 days, plus; in December of 1933, 39 days, plus; and in December of 1934, 12 plus days. This chart is drawn as of the end of each month, so in order to give February 1 figures, it will be necessary to give the end of January. As of the end of January, 1935, we had 11.80 days of supply of gasoline available for immediate shipment, and at the end of February, 1935, 16 days, plus.

This exhibit shows at any time the total inventories and then the amount of gasoline that is available for sale. I have stated the difference between available and total.

I have compiled from the books and records of The Pure Oil Company a statement which shows, commencing on January 1, 1935, and ending December 30, 1936, the gasoline which we purchased from all Mid-Continent and East Texas refiners; which statement gives the name of the refiner, who shipped the gasoline, the date of the order, the number of the cars, what the price was, whether it was a flat price or contract price, the amount that we paid for it; the octane rating, the gravity of the gasoline and all the specifications which The Pure Oil Company required of the gasoline which it purchased.

1664 (Document handed to witness.)

That statement is correct.

(Document referred to received in evidence as EXHIBIT 741.)

Looking at Exhibit 741, The Pure Oil Company bought during the year 1935, 1,011 cars of 62 octane or below gasoline in East Texas.

In 1935 we bought our first gasoline out of East Texas on March 25. We bought 10 cars from Chief Refining Company, paying 3⅞¢ f.o.b. Gladewater, Texas. The specifications which The Pure Oil Company required of the supplier of that gasoline were that it should be 59 octane or better, 60-62 gravity, nine pound vapor pressure. Our specifications, then, related to more items than just octane of the gasoline.

In 1932 The Pure Oil Company's total gasoline sales exceeded 1931 by approximately 2%; in 1933 sales declined 3% from 1932; 1934 increased 6% over 1933; 1935 increased 13% over 1934; 1936 increased 13% over 1935. In the first 6 months of 1937 the sales increased 8% over a corresponding period in 1936.

The biggest increase in sales that The Pure Oil Company has had since 1930 over preceding years were the years 1935 and 1936.

Considering November to March as being the winter, the winter of 1935 and 1936 showed an increase of over 9% in our sales over the winter of 1934 and 1935.
1665 Total sales in January, 1936, showed an increase of 10% plus over sales in January, 1935.

It is generally true and it is so reflected by our books and records, that in the business of The Pure Oil Company, we have to build up a large increase in our inventory in the winter months to take care of our sales in the summer months.

Our inventories in the winter of 1934 and 1935, instead of the normal seasonal increase, declined during that period. So we entered into the spring of 1935 with relatively low inventories in comparison with sales demand with respect to previous years.

Of the 36 companies listed in this indictment as being independent refiners in the East Texas and Mid-Continent fields, from whom it is said these different companies purchased, The Pure Oil Company had purchased, prior to the time indicated, from 12. We bought from other independent refiners prior to 1935 who were in the Mid-Continent and East Texas, but whose names are not detailed in the indictment.

The Pure Oil Company does business in 32 states, but probably in about 6 we just touch the borders by virtue of operations in adjoining states.

Our refineries are located at Smiths Bluff, Texas; Mus-

kogee, Oklahoma; Midland, Michigan; Toledo, Ohio;
1666 Newark, Ohio; Cabin Creek, West Virginia; and we have another refinery at Marcus Hook, Pennsylvania, which has not been operating for the last few months in the production of gasoline.

In the Mid-Continent field The Pure Oil Company purchased one car from Wilcox Oil & Gas Company in January, 1935, and the next purchase was from Panhandle, on March 21, 1935. Omar Refining Company was the next Mid-Continent refiner from which the company purchased, the date being May 24, 1935. The first purchase the company made from Eason Refining Company was ½ car on June 7. The only other 63-70 octane purchased from Eason was 2/3 car on October 14, 1935.

We sell to jobbers in Wisconsin.

Redirect Examination by Mr. Chaffetz.

Our first purchase in the Mid-Continent field, after March of 1935, was from Panhandle Refining Company. I mentioned one car which we had purchased from Wilcox in January.

The next purchase we made in the Mid-Continent field was from Vickers Petroleum Company on May 11, third grade gasoline. All purchases from Panhandle in 1935 were of 63-70, except 5 cars. Purchases of 63-70 octane from Mid-Continent refiners after February, 1935, were:

Panhandle, March 21, 29, April 2, April 3, 4, 18
1667 (two purchases), 19, 22, May 3, 6, 10, 16; Omar Refining Company, May 24, June 3; Eason Oil Company, June 7; Omar, June 7 (delivery of this order went forward on June 8 down to July 1); Waggoner, July 5, 16; Wirt Franklin, July 16; Omar, August 7, 22, September 6, October 3; Eason Oil, October 14 (2/3 car); Omar, November 1 (35 cars), December 7 (3 cars), 11 (32 cars); Wilcox, December 11.

Q. So that you would say that your company purchased 63-70 octane gasoline pretty regularly during the months of March, April and May from Panhandle, and quite regularly during the months of June and July, August, September, October, November and December from Omar?

A. Well, toward the end of the year, those purchases I wouldn't classify as frequent, one or two purchases a month.

1668 **GEORGE G. BROWNELL,** a witness for the Government, testified as follows:

Direct Examination by Mr. Chaffetz.

I live in Westfield, New Jersey. I am associated with Cities Service Company, and my office is at 60 Wall Street, the principal place of business of the company. Cities Service Company is a holding company, owning stocks and securities of public utility, oil and miscellaneous corporations. That company has been in business since October, 1910.

Henry L. Doherty and Company, which was organized in 1906 as a partnership, with Henry L. Doherty and Mr. Frank W. Frueauff, now deceased, as partners, until September 30, 1935 operated as a staff of technical advisors to the subsidiary properties of Cities Service Company. At that time the Cities Service Company took over this staff directly.

This organization counselled and coordinated the various activities of the subsidiaries of the Cities Service Company, by a system of reporting to the New York office from the subsidiary companies the facts respecting all operations of the subsidiaries. This enabled the New York office to advise them properly as to their general activities and give them any suggestions and recommendations.

1669 One of the members of the New York office of Henry L. Doherty, and his assistants advised and kept in touch with the marketing operations of the respective subsidiary companies. The activities of the various subsidiaries of the Cities Service Company were coordinated to eliminate overlapping of activities, but not in the sense of directing the activities and operations.

I have known Harry D. Frueauff since about 1905 or 1906. He has been an employee of Cities Service Company since September 30, 1935. He had been an employee of Henry L. Doherty Company since 1917. I think he came with one of the subsidiaries of Cities Service Company or one of its public utilities in 1907. Harry D. Frueauff was a brother of Mr. Doherty's first partner with the Henry L. Doherty and Company. He had been connected with the Cities Service organization practically throughout its life. Mr. Frueauff's duties were to keep in touch with the activities of the marketing and refining problems and affairs of the Cities Service subsidiaries.

In the main he would report in 1935 to 1936 to F. R. Coates, a director of Cities Service Company and a member of the committee of executives whose particular function was to look after general petroleum interests in all its phases and the natural gas interests.

Cities Service Company has no natural gas and petroleum interests but it has stock interests.

1670 Mr. Coates also protected the interests of Cities Service Company in the various subsidiaries and affiliated companies. Mr. Frueauff's interests were mainly in the marketing and refining activities of petroleum production.

Cities Service Company had a number of subsidiary and affiliated companies that were interested in the marketing and refining of gasoline. Among them was Empire Oil and Refining Company. It had eastern companies operating in the eastern fields. Through the ownership of common stock of Arkansas Natural Gas Company which in turn owned common stock in Louisiana Oil Refining Company, the Cities Service Company indirectly owned through stock ownership those refining and producing and marketing companies.

Mr. Frueauff is vice-president of the Empire Company. He was also an officer of several other subsidiary or affiliated companies, generally, the companies that were engaged in the marketing and refining of gasoline.

Q. If Mr. Frueauff were to refer to the over-all company, or the operation of the over-all company, what would he mean?

A. The over-all company?

Q. Yes, the over-all company.

A. Well, of course, in our financial statements we give a consolidated balance sheet of the Cities

1671 Service Company and subsidiaries, and earning statements the same way.

Q. You don't show in your reports, in your earning statements anything about the over-all companies participating in a general buying movement, do you?

A. Not to my knowledge whatever.

Q. So that any information of that sort wouldn't be collected by Mr. Frueauff for the purpose of putting it in a financial statement?

A. I don't know as I could answer it, just who would accumulate such information.

Q. You are sure, though, that if Mr. Frueauff referred to the over-all company, he meant the

Cities Service Company and its various subsidiary and affiliated companies?

A. Well, it depends entirely on what the question was. I might speak of the over-all company, and I might refer to the Empire Oil and Refining Company.

Q. You wouldn't call the Empire Oil and Refining Company an over-all company?

A. When speaking about marketing and production companies, yes. I would. It depends entirely on the occasion for his answer.

By the Court

I heard that term used in some of the business meetings. They had in mind when they used it, the
1672 over-all picture of Cities Service Company and its subsidiaries, and presumably the Cities Service organization to an extent, but that is a misnomer, because Cities Service Company is a holding company and merely holds and controls the voting stock, control of some of which, unfortunately, since dividends weren't paid on the first stock of some of the subsidiaries, has passed out of the Cities Service organization. The stockholders had a right to vote themselves and have taken the voting control away from Cities Service Company. But that is about an entirely different occasion. That was talked of in 1935 and 1936.

Presumably, if the term was used in a meeting of our people—for instance, the American Petroleum Institute where some of the Cities Service men were present—the over-all picture would be the various oil representatives or oil subsidiaries that are joined together under the operating staff of New York, so far as their receiving advice, but it is a term that I don't know has had general use.

The annual report of December 31, 1936, showed 98 subsidiaries of the Cities Service Company.

The Court: You wouldn't speak of any of those 98 companies as the over-all company, would you?

A. Judge, I don't know just in what manner I would want to express myself.

1673 *By Mr. Chaffetz*

Since the letter, Exhibit 454, is directed to a subsidiary of Cities Service Company, I am afraid I would have to be forced to the conclusion that the over-all company referred to was the Cities Service Company and all its companies together; I know nothing about the significance of that letter or the reference of your question.

Q. We are dealing only with the significance of the term "over-all company," and that is the way you would understand that letter if you read it?

A. Over-all marketing situation.

I testified that during the year 1935 the activities of Henry L. Doherty and Company were transferred to Cities Service Company itself. Since then they have been carried on by Cities Service Company.

(The witness was excused.)

(Mr. Lewin read Exhibits 221, 246, 240 and 250, and the sections of the following indicated; Exhibit 198, "Tank Car Markets", except for quotations, and "Standard of Indiana Territory"; Exhibits 200, 201, 203, 204, 217, 215, "Tank Car Markets", except quotations; Exhibit 218, "Tank Car Markets", except quotations, and "Standard of Indiana Territory".)

Mr. Chaffetz: Exhibit 742 is a stipulation with respect to the receipt of certain documents by A. V. Bourque. I offer this exhibit in evidence.

The Court: It may be received.

1674 (Document referred to received in evidence as EXHIBIT 742.)

Mr. Chaffetz: I offer Exhibit 743 in evidence, being a stipulation signed by Louis Mead Treadwell as attorney for the Socony-Vacuum Oil Company, Inc., Bryan S. Reid, and C. L. Jones, defendants.

The Court: It will be received.

(Document referred to received in evidence as EXHIBIT 743.)

Mr. Chaffetz: Exhibit 744 is a stipulation signed by counsel for The Texas Company, W. S. S. Rodgers, H. W. Dodge, R. D. Cottingham, and P. C. Scullin. I offer that exhibit in evidence, and ask permission to read it.

(Mr. Chaffetz read Exhibit 744 to the Jury.)

Mr. Lewin: May it please the Court; the witness Jacobi has identified Exhibit for identification 84 as being a copy of a letter to him from the defendant Charles L. Jones. He also identified Exhibits 83 and 80 for identification as enclosures in that letter. The Government now offers those four Exhibits in evidence against the defendant Charles L. Jones alone.

Mr. Thomas: If the Court please, we object to the admission of the Exhibits now offered on the same grounds as heretofore stated relative to the reception in evidence of Exhibits 334, 335, and Exhibit 287, and the other documents designated as being produced from the files of the Shell Company.

1675 I wish to add to the objection the further ground that the documents which the Court is now examining and which are now offered in evidence refer to a cargo of gasoline on the Gulf of Mexico, and not to any transaction within the Mid-Continent or East Texas field, and is consequently outside of the purview of the indictment.

The Court: Objection overruled. Exception allowed.

(Documents referred to received in evidence as EXHIBITS 84, 83 and 80.)

Mr. Chaffetz: Exhibit 745 for identification is a stipulation identifying certain documents that were heretofore marked in evidence for identification.

I now offer in evidence two documents that are thus identified, Exhibits 337 and 338.

Mr. Thomas: If the Court please, the defendants make the same objection to the receipt in evidence of Exhibits 337 and 338 as was previously made to the offer by Mr. Lewin this morning, the objection being on the same grounds to those exhibits as heretofore stated relative to the reception in evidence of Exhibits 334, 335, 336 and likewise to Exhibit 287, and other documents designated as having been produced from the Shell Company files. These grounds appear at R. pp. 504-05, 556-57, 721-23.

The Court: Objection overruled. Exception allowed.

(Documents referred to received in evidence as EXHIBITS 745, 746, 337 and 338.)

1676 **CHARLES J. BARKDULL**, a witness for the Government, testified as follows:

Direct Examination by Mr. Chaffets.

I live in Evanston, Illinois. I have been connected with Standard Oil Company of Indiana since August 1916. My position since May 1933 has been executive vice-president and treasurer. Just previous to 1933 I was treasurer and vice-president.

My experience with the company has been on the financial side largely, accounting and auditing. I have not been engaged in the operating end of the business, but there are problems in connection with everything that we handle in our different departments that are coordinated; and naturally their problems are the general problems of the board of directors.

Our company has its principal place of business in Chicago, Illinois. That has been true for many years. All of the executives of the company are located in that office.

The defendant Allan Jackson is a director, and the vice-president in charge of sales. He has been a director about 17 years, during which period he was in charge of sales as vice-president. He directs the activities in connection with our marketing in the states in which the Indiana Company operates.

All policies in respect to sales are the duties of 1677 the head of the sales organization. The determination of prices of gasoline sold in the Standard of Indiana territory is only one of his numerous problems. His chief duty in my estimation would be the obligation to dispose of the products manufactured by our manufacturing department at a fair price if possible. I would say at the best price he is able to obtain, recognizing other facts. I wouldn't say necessarily always at the best price he is able to obtain. The determination of price policies comes under his department.

Mr. Allan Jackson was active in the company during 1935 and 1936. Most of the time that he was not making field trips or taking time out in respect to a vacation he was present at his desk in the general offices in Chicago.

The defendant E. J. Bullock is now and for the last 15 years has been director and vice president in charge of purchases. He heads up the activities of our purchasing department, which I characterize as a service department on behalf of the sales and manufacturing department in making purchases. It is his duty to purchase all the gasoline for the sales department from time to time. I know that he would consult the manufacturing department which has the obligation to supply the sales department with their requirements, and I would assume that he would consult the sales department.

The defendant E. G. Seubert is and has been 1678 since May, 1927, president of our company and chief executive officer. He has been connected with the Standard Oil Company of Indiana approximately 40 years. He was very active during 1935 and 1936. He is accustomed to paying as close attention to the detail affairs of the company as his time permits. He does watch the business very closely. I would characterize him as an extremely active chief executive. He supervises the operations of the company closely with the assistance of his vice-presidents and others.

I think it is true that the level of tank car prices is a matter of vital concern to Standard Oil Company of Indiana and to the president of our company. In the normal course of his duties, I think he would keep in close touch with the trend of tank car prices, in respect to the general trend, though he wouldn't assume the obligation of watching day to day quotations. He might put his own interpretation on the causes of the trend of tank car prices, as we all do, on a lot of these situations on these trends.

I think the duties of the chief executive officer of our company would include knowledge on his part of any activities by our company, affecting the level of tank car prices.

Q. In other words, if Mr. Bullock were purchasing gasoline in a movement or program directed at the raising of tank car prices, he wouldn't do it without Mr. Seubert's approval, would he?

1679 Mr. Kirkland: Now, that is objected to. How can he tell what Mr. Bullock would do?

The Court: He may answer that. Exception allowed.

A. I don't think he would, logically.

Mr. Chaffetz: Q. No, and he would probably discuss it with Mr. Jackson and Mr. Seubert before he proceeded, wouldn't he?

A. Who do you mean, Mr. Bullock?

Q. Yes.

Mr. Kirkland: The same objection, and for the same reasons.

The Court: Overruled. He may answer. Exception allowed.

A. I don't see why he would discuss it with Mr. Jackson.

Mr. Jackson is the head of the sales department. It is the obligation of the refinery department to take care of the requirements of the sales department, and I don't know whether the sales department cares where the products come from or not, just so they meet their specifications.

Q. No, they may not care where the products come from, but they may be interested in anything that may be done to affect the level of the prices, isn't that true?

Mr. Kirkland: I object to arguing with the witness.

1680 Mr. Chaffetz: Q. I think you already told me that. You already told me that the vice president in charge of sales is interested in prices.

A. Well, I think generally all directors and officers of the corporation are.

Q. Yes, and particularly the man who is selling the gasoline is interested in the price he is going to get for it.

A. That is true.

Q. All right. Now, if Mr. Bullock was engaging in a program to affect prices, affect the level of prices, that would be a matter of interest to the vice president in charge of sales, wouldn't it?

A. I think it would be of interest to all of us.

Q. Yes, and wouldn't Mr. Bullock discuss that with Mr. Jackson before proceeding?

A. Well, I can't answer that, because I don't know.

Q. Your testimony is that you don't know, yourself, whether your company was participating in any program such as I have described?

A. It was never brought to my knowledge.

Cross-Examination by Mr. Kirkland.

As the executive vice president I keep myself as well informed as I can of the doings of the company. 1681 Part of my duties are to coordinate the work of the different departments as well as to act as treasurer, and look after the finances of the company. Those were my duties in 1934, 1935 and 1936.

The defendant Ira Smith is an employee of the Standard Oil of Indiana. He lives in Tulsa. As far as I know, Mr. Smith had no authority in 1935 and 1936, in regard to buying gas. I assumed that Mr. Smith was Mr. Bullock's contact man in Tulsa. If he wanted to purchase 20 or 25 cars of gas, he would consult his superior, and get approval. He did not have any authority, to my knowledge, to fix prices in 1935 or 1936 on gasoline.

The defendant Mr. Seubert was not in Chicago during February, 1935. He never, at any time in my presence, said anything to me from which I would judge that he knew or from which I could conclude that Standard of Indiana or any of its officers in concert with any other companies was engaged in a program of buying contrary to the law.

Q. Did he say anything in your presence in 1935 or '6, that the Standard of Indiana or any of its officers were engaged in any buying program, whether it was contrary to law or not?

A. I never heard him discuss any program.

I know enough about the sales department to know whether or not they try to sell at the very best price they can get. There are a number of questions that enter into whether a gallon of gas should be sold at the very 1682 best price they can get for it. They have got to take into consideration what the traffic will bear, and what their competitors are doing, too.

As to what factors we take into consideration in determining what the sales price of gasoline is, either today, in Madison, or in 1935, I think the primary factor is what the competitor is doing in the community in which the price is created.

By the Court

If we want to continue in business we take into consideration the cost of that gasoline. I guess there have been periods when gasoline has been sold at less than cost, by all of us. We try to buy at the lowest price also.

Q. Did your officers in 1935 know that there was an upward trend of the price of gasoline purchased by the major companies?

A. According to the quotations, that is true.

Q. Were you interested in that?

A. Yes, sir.

Q. Did you do anything to try to break down that upward trend?

A. No, sir.

Q. But you were still trying to buy gasoline at the lowest price?

A. At the going market price.

1683 *By Mr. Kirkland*

The company has no chairman of the board, so Mr. Seubert, the president, is the chief executive. Numerous matters of importance come to his attention every day.

To my knowledge not every order for the purchase of a car of gas would come to Mr. Jackson's attention. I don't think he would have time for that.

I was not in Chicago in March, 1935. I was on my vacation.

At your request, I got some figures upon the purchase of tank car gasoline from independent refiners in the years 1931 to 1936 inclusive. Those figures were taken from the books of the company. I believe them to be accurate.

The number of tank cars of gasoline purchased by Standard Oil of Indiana from independent refiners in 1931 was 841 cars; in 1932, no purchases. 80 cars were purchased in 1933, all after October; in 1934, 1230 cars; in 1935, 795 cars. The date of the first purchase in 1935 was January 14, 25 cars.

Mr. Chaffetz: Are you sure that is right, Mr. Barkdull? You mean during the whole month of January, 1935, 25 cars?

A. Yes, sir.

Q. Total purchases?

A. In January, 1935, our records disclose that we purchased 25 cars, yes, sir.

1684 Q. Don't you have a record—I am sorry, Mr. Kirkland, for interrupting—do you have a 10 car purchase from Panhandle in January, 1935?

A. I haven't the detail as to whom it was purchased from.

By Mr. Kirkland

In February, 1935, 25 cars were purchased. That purchase was February 21st. In March, 75 cars were purchased. The date of the first purchase in March was March 8, 25 cars. In April, 1935, 85 cars were purchased; in May, 75 cars; in June, 60 cars; July, 50; August, 60; September, 65; October, 100; November, 50; December, 125. That totals 795.

In the year 1936: 100 cars were purchased in January; in February, 100 cars; in March, 75 cars; April, 100 cars; May, 100 cars; June, 100 cars; July, 100 cars; August, 100 cars; September, 50; October, 50; November, none; December, 50. The total for 1936 is 925.

This gasoline was bought on specifications in the years 1934 to 1936 inclusive.

Standard of Indiana turns out at the peak, possibly in excess of 600 tank cars of gasoline a day.

When I made inquiry in respect to the preparation of this statement, I scrutinized the purchase orders. Most of the purchases in 1935 and 1936 were placed with Waggoner Refining Company. Of the gas purchased in 1935, the octane on house brand gasoline was 69.5. That is all leaded gas. I think we purchased 200 cars in 1937
1685 from Waggoner. Our records show at least 200 cars.

I have some figures showing the refinery inventory of Standard Oil of Indiana for the years 1932 to 1936, inclusive. These are in 42-gallon barrels.

At the termination of May, 1932, the month in which the highest point was reached by the gasoline inventory in that year, we had on hand 6,625,000 odd barrels. As to the low for that year, in October, we were down to 4,891,000.

At the end of April, 1933, the high for the year, we had 6,425,000 barrels on hand. October 31 of that year, the low, we had 5,186,000 barrels. March was high in 1934, 5,628,000 barrels. November was the low that year; it was down to 3,188,000 barrels. June was the high in 1935; we had 4,708,000 barrels. The low was January 31st, 3,706,000 barrels. The high in 1936 was at the end of February; we had 5,260,000 barrels of gasoline on hand. The low was October 31st, 4,161,000 barrels.

The figures I have given you follow the practice of the Bureau of Mines, and show the ultimate volume of gasoline that would be available as completely finished in the same month. There would be as much as 20% of the January, 1936, figure of 5,260,000 barrels, that I would say was not

available for shipment. Refineries have to have available
certain working stocks, and they can't entirely deplete all
their tankage or their working stock. Furthermore,
1686 there is tank bottoms. We sell what we refer to as
a balanced gasoline, which is a little more volatile in
the summer time than in the winter. And we store up light
ends in the summer and put in the light ends in the winter
months. We have furnished the Bureau of Mines for years
with our inventories of gasoline on hand at our refineries.
That is a United States Government Bureau, of the Department of the Interior.

The people that live with the problem have contended that approximately a 45 day supply of gasoline in storage at the refinery is necessary in order for Standard of Indiana to transact the business it did in 1934, 1935 and 1936.

Before June 1, 1935, and particularly during 1934 and 1935, Standard of Indiana could not refine and produce all the gasoline that it wished to. There was a governmental agency to control the crude run in the refinery or the volume of gasoline produced. That was the Code. Those restrictions were removed at the end of May, 1935. Standard of Indiana then, in regard to its refinery inventory of gasoline, began to step up its runs.

Consumption is not as heavy in the winter months as in
the summer months, and this results in variations in refinery inventory figures from month to month. Recognizing the ability or capacity of the refinery and the projection of sales, it is necessary for the refiners to anticipate
the peaks of high consumption, say, from May to Octo-
1687 ber 1, inclusive, and build up stocks in the winter
months; furthermore there is the obligation that at
least one refinery has, to supply our lake bulk terminal
points, five of which are supplied out of Whiting, Indiana.
They start building up refinery stocks first as soon as the
peak season is off in the fall of each year to take care of
the peak shipping periods, beginning on or about March 1
of each year. The Standard of Indiana transports by boat
a large amount of gasoline.

At your request I made a record of the sales of Standard of Indiana in the years 1932, 1933, 1934, 1935, and 1936, stated in 42-gallon barrels.

In those cars bought from independent refiners, there were about 160 barrels to the car. 50-gallon barrels were bought from the refineries.

The sales for 1932, by the parent corporation alone, were 27,802,000 barrels; for 1933, 25,789,000 barrels.

In 1932, the company made no purchases from independent companies. The high refinery figures in 1932 were 6,625,000. That is a monthly figure, at the end of the high month. The figure at the close of December, 1932, was 5,187,000 barrels. Our sales in 1932 were not as high as were anticipated at the start of the year.

Our inventory in November, 1933, was down to 4,970,000 barrels, off a couple of hundred thousand barrels from the
closing figure at the end of 1932. The December in-
1688 ventory was approximately 5,000,000.

Q. So in the year 1933 when you didn't start buying until the end of the year, you had a low inventory, is that correct, and your sales had dropped off over 1932?

A. Well, it was low—I mean it was rather high because we couldn't dispose of it. Our sales had dropped off.

Our sales in 1934 were 26,921,000 barrels; in 1935, 27,537,000 barrels; and in 1936, 30,836,000 barrels.

At the end of December, 1934, our inventory of gas at the refinery was 3,383,000 barrels. The conclusions of our refining people were that that inventory was inadequate to efficiently conduct a business of the volume of Standard of Indiana. There was an increase in consumptive demand of gasoline and also other petroleum products in 1935 over 1934. The general business conditions were better in 1935 than in 1934.

Taking into consideration the conditions as they existed in 1935, as far as Standard of Indiana was concerned, and also taking into consideration the conditions in regard to consumptive demand of gasoline generally throughout the Standard of Indiana territory, I would say a reasonable figure, a proper figure, that our refineries should reach in order to conduct a business of the volume of Standard of
Indiana would be 5,500,000 barrels. We did not reach
1689 that figure in our refinery inventory in the year 1935.

At the end of February, 1936, we were short about 240,000 barrels. We never reached the 5,500,000.

When I said in answer to Mr. Chaffetz' question that Mr. Bullock probably would consult the manufacturing department and the sales department in the purchase of gasoline, I meant he contacted a committee or group that we have in the manufacturing department that have the obligation to watch the statistics on inventory and production and all statistical figures in connection with operating the refineries. That is the department that Dr. Paulus is the head of.

Outside of the man that I speak of in the sales department, this accountant in the auditing department of the sales department, aside from him, it wouldn't be necessary to contact anybody in the sales department. So in the purchase of this gasoline, whether Mr. Bullock contacted anyone in the sales department, I of my own personal knowledge, do not know.

The purchase of 800 or 900 or 1200 tank cars of gasoline in one year is a matter that would be within the authority of the head of the purchasing department, without conference or consultation with anyone else.

Redirect Examination by Mr. Chaffetz.

In response to a question of Mr. Kirkland, I said that the head of the purchasing department, meaning Mr. Bullock, wouldn't have to get authority from anybody else 1690 to purchase as much as 800 cars a year. The question whether he would have to get authority if we were buying 800 cars of gasoline as a part of the major company purchasing program directed at the raising of prices, is an entirely different one.

Q. If Mr. Bullock were to buy not 800 cars, but if he were to buy 10 cars of gasoline in any one year as a part of the major company purchasing program directed at raising prices, he wouldn't do it without further authority, would he?

A. Well, I hope he wouldn't if he thought it was contrary to the law.

Whether or not he thought it was contrary to the law, I don't imagine he would.

I have the total amount of our inventories on March 1, 1935. I have the end of February 4,135,000 forty-two gallon barrels. It would be about 168 million gallons. At that time we should have 45 days' supply on hand. 45 days' supply in gallons would be about 210 million gallons. I would say we were short about 42 million gallons.

We purchased 75 cars in March, 1935. It would be about 8,000 gallons to the car, making about 600,000 gallons. We bought a little over 500,000 gallons during March; whereas we were short, in order to have the supply on hand that we think is necessary in order to run our business, 42 million. We had a very low inventory, as I have ex- 1691 plained here, at the termination of 1934. Our refiners were making applications to the Refinery Subdivision for relief in respect to running additional volume of crude; and while this amount might not have been material, it would help to the extent of that number of gallons you have referred to, namely, 600,000 gallons.

We were short, from the viewpoint of what we would like to have as the minimum inventory. I don't know how Mr. Bullock reached the conclusion that we required 75 cars. That 75 cars is an insignificant amount for our company. I don't think it was necessary to prepare an estimate on that volume of purchase.

Q. And those 75 cars were not bought in order to carry out a prediction that you would need 75 cars additional for that month?

A. No, I don't think it fitted into any program of purchase at all.

In June 1935 we increased our runs to stills. There was no restriction after May as to the amount that we could run. We didn't increase our inventory at the end of June over the end of May at all because we were getting into the period of rather high consumption here. Our inventory at the end of May, 1935, was 4,464,000 barrels in excess of 160 million gallons.

In June 1935 we purchased 60 cars of gasoline. That is less than 500,000 gallons. We were free to run our refineries
as full as we wanted to at that time, but sometimes
1692 there are mechanical difficulties that the refiners have
to look into before they can set them up over night. There were no mechanical difficulties in June that I could relate to you that made it necessary for us to purchase 60 cars of gasoline. I think it is true that 60 cars is too insignificant an amount to have any relation to mechanical difficulties, capacity of our refineries, our inventories on hand or our program of sales and purchases.

By the Court

There has been some testimony here that Standard of Indiana is what they call the market leader. I think when they refer to our company as the market leader, it is because of the position we have attained in respect to the volume that we sell compared to any other individual competitor in the states in which we operate. With respect to this volume that the Standard Oil Company sells versus a competitor, I think we would be a market leader if the competition followed our price. As long as we can post prices at our service stations that competitors elect to follow, presumably we are a market leader; in other words, if we post a decline at the service stations and the competitors all follow our price posting reductions, we are the market leader in that respect; but if we elect to increase prices and the other fellows don't follow we are not much of a market leader.

The price charged to the consumer at the filling station was not arrived at by any conference or consultation
1693 with the oil companies doing business in that particular territory, not to my knowledge.

Certainly we care what the other fellow does. We hope that in posting that price he will follow; but if he doesn't follow and increase his price—if this happens to be an increase—why, we have to change our ideas of the situation, if we want to hold our volume of business, and we may back down.

I can't say specifically how many times our company has increased the price of gasoline in Wisconsin during 1935, but after September, 1934 and the adoption of this formula, unless there was some local situation that confronted them, at Milwaukee or Rockford, or some place else, I don't think that there was any increase in the last half of 1935.

There were no changes in the tank car price during the latter half of 1935, and there wasn't so much hot oil after they adopted this Connally Act there. I think there were some increases in price in 1936.

I think I could show you numerous instances when we had to lower our price because of the failure of other oil companies to come up to our price. I won't confine it to Wisconsin, but in the states in which we operate. Quite generally they follow the price set by Standard of Indiana where we reduce. And where we raise, generally it won't take long for the individual or the company that posted the lowest price in the community, all other things being
1694 equal in respect to service specifications of his product, to get the majority of the business in that particular community; and if we don't follow the competitive prices as posted, we won't stay in business in that particular community very long, in my estimate.

I don't know whether it was in the year 1935 or 1936, but there have been prices posted by other companies in Wisconsin that it was necessary for us to follow. I think generally the statement is true that the price fixed by Standard of Indiana in Wisconsin is followed by the other oil companies, doing business in this state.

By Mr. Chaffetz

I can't answer to my knowledge, whether in March, April, May and into June 1935, when the tank car price was rising, our company increased its retail prices in the Indiana territory. I know that the tank car price did level off in the latter part of 1935. But whether the retail price in the early part of 1935, say up to the end of May, responded to that increase, as far as the retail price to consumers at service stations is concerned, I don't know. It is natural to suppose that as the tank car prices went up, the retail price would respond, if they were stabilized.

The total sales of our company in 1935, Indiana territory, figures, were 27,537,000 barrels. That would be about 1,155 million gallons. I think it is true that I said our purchases during that year were about 800 cars, or about
1695 6,400,000 gallons. Our sales in 1935 were 1,155,000,000 gallons, and our purchases were 6,400,000 gallons. Our purchases would be approximately ½ of 1% of our sales.

Cross-Examination by Mr. Kirkland.

It is a fact that beginning in the latter part of 1934, our company was attempting to build its inventory up to the figure I have stated as the necessary figure to conduct the business.

Standard of Indiana started business in this territory, in what they refer to as the Standard of Indiana territory, these 10 states, after the 1911 dissolution of the so-called Standard Oil Trust. This company was a subsidiary at that time of the Standard Oil of New Jersey. After the dissolution the stock in this company was distributed to the stockholders of Standard Oil Company of New Jersey, and Standard of Indiana then started in doing business separately or independently of the so-called Trust, or Standard of New Jersey.

I do not believe that any of the present day majors, or the defendants in this case, were doing business in the Standard of Indiana territory at the time Standard of Indiana started. Gradually as time went on down until the present day competition in the shape of the other major companies and other oil companies began coming into the territory, until gradually the percentage of the whole
1696 business in the territory that was enjoyed by the Standard began to be reduced very definitely. There has been a material loss in our percentage of the whole territory for the last 10 or 15 years.

Standard of Indiana was the pioneer in this territory. I believe it was because of that that it became known as the Standard of Indiana territory.

Today, or in 1935 and 1936, Standard of Indiana does not, in determining the price at which to sell its gas, confer with any of these other major companies. If the Standard of Indiana conferred with any of these other major companies, or with any oil or gas companies, jobber or broker, in determining what their sales price shall be, I would assume that I, as executive vice president and treasurer, would have knowledge of it, but I do not. I think I can say that if, in 1935, Standard of Indiana had decided to raise the price of its gas, I would be in position to know whether they sat down and conferred with other major companies as to what price they should put upon it. I never heard of any such conferences that occurred.

Redirect Examination by Mr. Chaffetz.

I did not know about a meeting held in the office of Mr. Bullock on February 5, 1935, at which representatives of other major oil companies were present.

1697 Q. So that meetings could be held by executives of your company with executives of other oil companies, and you would not know about it?

Mr. Kirkland: That is objected to, assuming that such a meeting was held.

The Court: Overruled. Exception allowed.

A. That is true.

By the Court

There are several factors I think that are recognized in the increase of prices of gasoline. If there is an increase in the price of the raw material, namely, the posted price of crude oil, and if that increase is reflected in the spot tank car market by the refiners that purchase Mid-Continent crude, we would recognize that increase also in our price to the consumer, whether we bought any cars on the spot market or not. There was no increase in the prices carried during 1935.

Offhand I could not say that there was any definite increase in our retail price to the consumer during that March, April, May and June, 1935, period. There may have been. It is not part of my duties, and the sales department and their group watch that situation quite carefully. I do not.

Cross-Examination by Mr. Kirkland (continued).

Approximately 70% of the crude used by Standard of Indiana in 1935 was purchased, in 1936, about 65%.

1698 Q. You said something about the amount of gas you were allowed to make in 1933 and 1934, down until the end of the Code in 1935. Do you know whether or not the company at different times appealed from the order of the allocator limiting their run as to the amount of gasoline?

Mr. Crawford: I object to that.

A. Yes, sir.

Mr. Crawford: I object to that as incompetent, irrelevant, and immaterial. It has no bearing on any issue or side issue in the case, their appeal to the board.

The Court: Objection sustained. Exception allowed.

By Mr. Donovan

In 1935 Standard of Indiana had to raise its price because of the price-fixing order of the Wisconsin Department of Markets.

I know the gasoline tank car price was subnormally low through 1934. That was also true in the early part of 1935. I don't know whether the retail price responded to the tank car price in the early part of 1935.

1699 W. J. MILLER, recalled as a witness for the Government, testified as follows:

Direct Examination by Mr. Lewin.

I have reviewed the figures given in evidence by the witness Bradshaw on his cross-examination with respect to tank cars of gasoline purchased on the spot market in East Texas from March 1, 1935, to April 30, 1936.

For each of the months from March, 1935, to April, 1936, inclusive, Mr. Bradshaw purchased for the Gulf Company at the low of Platt's Oilgram, the following number of cars: March, 1935, none; April, 80; May, 52; June, 152; July, 185; August, 184; September, 207; October, 167; November, 201; December, 256; January, 1936, 243; February, 243; March, 257; April, 241; Total, 2468.

Mr. Bradshaw testified to the purchase of 3535 cars during that 14 months period for the Gulf Company in East Texas. 70% of that total, according to my computation, was purchased at the low of Platt's Oilgram.

For each of the months from March, 1935, to April, 1936, inclusive, Mr. Bradshaw purchased through 1700 Mr. Cline of the East Texas Refiners Association for the Gulf Company the following number of cars: in March, 1935, 75; April, 139; May, 131; June, 95; July, 165; August, 120; September, 165; October, 109; November, 161; December, 220; January, 1936, 210; February, 196; March, 233; April, 195; Total, 2214.

The purchase orders and invoices of those cars disclosed the prices at which they were purchased. I have compared those prices with the prices on the same day contained in Platt's Oilgram for the same type of material. All the cars purchased in March, 1935, were purchased at ⅛¢ below the low of Platt's Oilgram; in April there were 71 purchased at the low; May, 48; June, 95; July, 165; August, 120; September, 165; October, 109; November, 161; December, 220; January, 1936, 210; February, 191; March, 233; April, 195; Total, 1983.

The total number of cars purchased at the low was 90% of the total purchased through the Association. All of the cars purchased by Mr. Bradshaw for the Gulf Company through the Association in the months of June, 1935, July, August, September, October, November, December and January, 1936, and March and April, 1936, were purchased at the low of Platt's Oilgram. And all of those purchases by Mr. Bradshaw through the Association for the Gulf Company in February, 1936, ex-
1701 cept 5 cars, were purchased at the low.

During the entire period 226 cars, or approximately 10% of his total purchases, through the Association, were purchased at ⅛¢ below the low. There were no purchases at ¼¢ below the low. There were 5 cars purchased in February, 1936, at ⅜¢ below the low. The 5 cars were less than 1% of the total, about ½%.

During this period 62% of the total purchases by Mr. Bradshaw for Gulf were made through the Association, that is, of the total of 3535 cars purchased during the period 2214 were purchased through the Association.

Almost 400 of the 667 cars purchased by Mr. Bradshaw for the Gulf Company in February, 1936, were purchased below the low. That was the largest amount purchased in any one month by Mr. Bradshaw for the Gulf Company. The next largest month is March, 1936, when 367 cars were purchased. That was approximately half of Bradshaw's February purchases for Gulf.

In February, 1936, when 667 cars were purchased, 196 were purchased through the Association. 191 were purchased at the low through the Association. The total amount purchased at the low during that month was 243.

I have prepared an exhibit (Exhibit 747) showing the total purchases of house brand, i. e. regular, and third grade gasoline made by the defendant companies other than Sinclair Refining Company from independent refiners during the period from March 1, 1935, to April
1702 30, 1936, inclusive. It is a schedule which reflects the purchases by tank cars over the period from March, 1935, to April, 1936, 14 months. This schedule is divided into two sections: those purchases in the East Texas field, and those in the Mid-Continent field. Then I show the number of purchases in tank cars for each month, in separate columns, through that period. And then, at the end, I have a column of the totals for each company and the grand total at the bottom.

The defendant companies I have considered are: Barnsdall Refining Corporation; that is, I have considered Barnsdall purchases before and after June of 1935 and I have simply taken the Barnsdall name as applying to the company that was doing business at that time; Cities Service Export Oil Company; Empire Oil & Refining Company; Louisiana Oil Refining Corporation; Continental Oil Company; Globe Oil & Refining Company. All 3 Globe Oil & Refining Companies made purchases from independent refiners in the period, March, 1935, through April, 1936. Gulf Refining Company; Mid-Continent Petroleum Corporation; Phillips Petroleum Company; The Pure Oil Company; Socony-Vacuum Oil Company, Inc.; Wadhams Oil Company; Shell Petroleum Corporation; Skelly Oil Company; Tide Water Oil Company; The Texas Company; Standard Oil Company (Indiana). I think that takes in all of them.

This exhibit shows the total number of cars purchased by those companies, both in East Texas and in the
1703 Mid-Continent field, during that period. The information was obtained from purchase orders and invoices submitted to this Court pursuant to subpoena, which have been in the custody of the Clerk. We have examined them in this building in the custody of the Clerk. This is a reasonably accurate computation.

The total number purchased by these defendants, other than Sinclair Refining Company, in each of the months starting with March, 1935, in the East Texas field were: March, 1935, 691; April, 401; May, 413; June, 649; July, 771; August, 652; September, 580; October, 502; November, 600; December, 640; January, 1936, 593; February, 1005; March, 674; April, 626; a total of 8797. They include cars purchased through the East Texas Refiners Association, as well as cars purchased directly and out of the Association.

The same figures for each month of the totals purchased in the Mid-Continent field by these defendants are: March, 1935, 757; April, 914; May, 891; June, 885; July, 1070; August, 876; September, 741; October, 666; November, 601; December, 788; January, 732; February, 610; March, 928; April, 925; total of 11,384.

I have prepared a study, Exhibit 748, of the prices paid by the defendant companies, exclusive of Sinclair Refining Company, for house-brand and third grade gasoline purchased by them from independent refiners in East
1704 Texas compared with the low quotations published in Platt's Oilgram for East Texas for the date of purchase, throughout the period from March 1, 1935, to April 30, 1936.

This schedule reflects the number of cars purchased in East Texas as being 8797, the same as included in that other schedule, Exhibit 747. That is the total of all purchased in the East Texas field, including those purchased through the East Texas Refiners Association.

(Documents marked Exhibits 747 and 748 for identification.)

The data I had on which I based this study were the invoices, purchase orders and shipping instructions, and correspondence pertaining to purchases, submitted here by these companies in obedience to a subpoena and which are in the custody of the Clerk. That data disclosed the prices paid for the gasoline. I did not make any classifications here of the kind of gasoline that I studied. In this East Texas area it was all third grade gasoline. We didn't classify any further than that. We regarded all the gasoline represented by these invoices as third grade gasoline.

Some of it was called U. S. Motor; some was called 60-62, 400 endpoint; some was described as 437 endpoint; some was described as gasoline under 62 octane; some was described by various brand names. It was all below 62 octane. Some of it did have endpoint specifications, but
1705 nevertheless we regarded that all on the basis of the octane rating and felt that it fell into the third grade

classification for comparison with Platt's Oilgram quotations.

In making up this study I had occasion to compare the quotations in the trade journals of 62 and below with the 400 endpoint gasoline. These quotations in the journals are usually exactly the same. I think there may have been a day or two occasionally when there was a slight variation. Roughly, these journals carry the same quotation for the 400 endpoint gasoline as they do for what is United States Motor third grade, 62 octane and below.

I think there are approximately 15 cars of 375 endpoint that we noted in our study. I don't just now recall in what fields they were. That is a negligible quantity when compared to the total number of cars involved in these fields. We classified it as third grade.

There were a few, I think approximately 500, sales in East Texas of leaded gasoline during this period. We didn't have quotations in the journals for regular grade gasoline in East Texas, so they have been omitted from these figures. Platt's Oilgram for East Texas doesn't publish a quotation for regular gasoline.

In each of these months some of the cars were purchased on the basis of Platt's Oilgram quotations. During the entire period there were 1305 cars purchased by defend-
1706 ant major companies on the basis of the low quotation
of Platt's Oilgram for East Texas. I have shown them separately by months on this study. The rest were purchased at flat prices. 7492 were purchased during that period at a specific price. 5430 cars were purchased at specific prices at the low of Platt's Oilgram. That is the second figure in the last column, totals. There were 39 cars purchased at ⅛¢ above the low of Platt's.

The difference was purchased below the low. I have them separated into various classifications. I have shown the number of cars purchased respectively, at 1/16¢, ⅛¢, ¼¢, 5/16¢, ⅜¢, ½¢, ⅝¢, 11/16¢, ¾¢, 13/16¢, ⅞¢, 1¢, and 1¼¢ below the low, and "miscellaneous." The "miscellaneous" were some cars for which we couldn't locate the original purchase invoices, but we did find some sales invoices indicating that the gasoline had been sold, but we didn't know exactly the prices it was purchased at. There were 22 such cars in the entire study.

There was 1 car purchased at 1/16¢ below the low. 837 cars were purchased at ⅛¢ below the low. 73% were purchased at the low or above the low. Five-tenths of 1% was purchased at ⅛¢ above the low. The percentage at the low is 72.5%. Adding the two together, we get 73%.

1707 My exhibit shows the percentages purchased at 1/16¢ below, ¼¢ below, and ⅛¢ below. The percentage purchased at ⅛¢ below the low was 11.2%. Adding that to 73%, we get 84.2%. 84.2% of all the gasoline purchased was purchased at ⅛¢ below the low or higher.

If I included the cars purchased on the basis of Platt's Oilgram low quotations, that would increase the percentage a little, probably 4 or 5 points. Instead of having 72.5% we would probably have 77% purchased below the low.

I think occasionally there may have been off-specification material included in here. I don't have the figures on that.

I have made a similar study, Exhibit 749, comparing these purchases of 8797 cars in East Texas during this period with quotations f.o.b. Group 3, in the Chicago Journal of Commerce.

(Document referred to marked Exhibit 749 for identification.)

79.4% were purchased at ⅛¢ below the Chicago Journal of Commerce or higher. 18.3% were purchased at the low of the Chicago Journal of Commerce. Those that were purchased on the basis of Platt's Oilgram quotations I just put in the total and didn't make any comparison. I only compared those 7492 cars which were purchased at specific prices.

I have prepared also a study, Exhibit 750, of the prices paid by the defendant companies, with the exception of Sinclair, for house brand and third-grade gasoline that was purchased from the independent refiners in the Mid-Continent field. On that study I have compared those prices with the quotations in Platt's Oilgram published for the Tulsa, Oklahoma market for the date of purchase during the period from March 1, 1935 to April 30, 1936.

(Document referred to marked Exhibit 750 for identification.)

1708 There are 11,384 cars total, and included in that were 9204 which were purchased at a specific price, that is, at a flat price. I compared those cars purchased at those flat prices with the quotations of Platt's Oilgram for the Oklahoma refinery market.

There were 77.7% purchased at the low or higher of Platt's Oilgram for the Tulsa market. At the low, 69.6%. 1/16¢ above, one-tenth of 1%. ⅛¢ above, 5.8%. 3/16¢ above, two-tenths of 1%. ¼¢ above, 1.5%. ⅜¢ above, one-tenth of 1%. ½¢ above, four-tenths of 1%. Then, there were 3 other cars purchased at other rates. That was too small to compute the percentage.

There were 153 cars purchased on the basis of Platt's Oilgram quotations. They were purchased by Continental Oil Company. There were 2027 purchased on a basis of the Chicago Journal of Commerce quotations.

I have prepared one more study of price, Exhibit 751-A, and Exhibit 751-B. I have the comparison of the Chicago Journal of Commerce quotations with the prices for the Mid-Continent purchases. My study is similar in form to Exhibit 750. I have it on two pages here instead of one. The only difference is that the comparison I make is with the quotations of the Chicago Journal of Commerce. It covers the same number of cars, 9204 purchased at flat prices and a total of 11,384 cars, and it covers the same months.

71.3% of the 9204 cars purchased at flat prices were purchased at the low of the Chicago Journal of Commerce; one-
tenth of 1% at 1/16¢ above; 8.1% at ⅛¢ above; two-
1709 tenths of 1% at 3/16¢ above; 1.7% at ¼¢ above; three-
tenths of 1% at ⅜¢ above; and two-tenths of 1% at ½¢ above. The total is 81.9% purchased at the low or higher.

My exhibit also shows here 2027 cars purchased on the basis of the Chicago Journal of Commerce. 1350 of those cars purchased at the low or higher; 1330 of those purchased at the low of the Journal; 5 cars at the high; and 15 cars at the low of the Journal plus $6.60 a car. That would increase to about 85%, I think, the total number of cars so purchased at the low or higher in comparison with the Chicago Journal of Commerce quotations.

There were 81.9% of the specific price purchases at the low or higher, and in addition to that there were 15 cars purchased at the low or higher which was on a basis of the Chicago Journal of Commerce. You have to add this to that. I haven't got that percentage split up.

At the low was 71.3%. 1/16¢ above, one-tenth of 1%. ⅛¢ above, 8.1%. 3/16 above, two-tenths of 1%. ¼¢ above, 1.7%. ⅜¢ above, three-tenths of 1%. ½¢ above, two-tenths of 1%. 3/16¢ below, three-tenths of 1%. ⅛¢ below, 12.4%. ¼¢ below and others, 5.4%.

The number of cars purchased each month by the defendants in the Mid-Continent field at the low of the Chicago Journal of Commerce, where the purchases were made at
flat prices which compare directly with the low of the
1710 Journal, were: March, 1935, 349; April, 317; May,
580; June, 499; July, 677; August, 614; September, 536; October, 461; November, 499; December, 481; January, 1936, 380; February, 354; March, 397; April, 520; total, 6564.

I would add to that those purchases when the price was determined by the low of the Journal. That is 1330. It is divided over the months, and shown on my exhibit.

(Document referred to marked Exhibit 751-A and 751-B for identification.)

Cross-Examination by Mr. Donovan.

I can't give you the name of the independent supplier from which the cars were purchased at 13/16¢ above the low, as shown in Exhibit 751-A.

Mr. Donovan: What I would like to have is a schedule, both for Mid-Continent and for East Texas, showing as to each purchase which you claim in your exhibits here were made above the low, this information.

First, the name of the purchaser.

Second, the name of the independent supplier.

Third, the date of purchase.

Fourth, the date of shipment.

Fifth, whether purchase date or shipment date was used in making the comparison.

1711 Sixth, the purchase price.

Seventh, the freight basis; that is, whether the purchase was f.o.b. Group 3 or f.o.b. refinery.

Eighth, octane rating of gasoline purchased.

Ninth, how the gasoline was classified by you for price comparison purposes.

And, tenth, destination of shipment.

As to question one, the schedule itself shows the name of the purchaser, all the way through.

As to question two, the independent suppliers were all added together. In other words, if there is one figure in there representing 100 cars purchased at the low in a certain month, that might represent 1 supplier or it might represent 40.

As to questions three and four: These figures record the date of purchase; the date of shipment might have been in a subsequent month. I think, for instance, in that purchase of 200 cars by Gulf in February at 13/16¢ below, I think that shipment was made over the months of February, March and April. The date of shipment in each case is different. There are 20,000 cars there, and to get the actual date on each one of those will mean listing 20,000 cars.

As to question five, the purchase order date was the date we used where we had a purchase order. In some instances,

we didn't have purchase orders; in that event, we used the invoice date, which was the date of shipment, or the
1712 date of the bill of lading; but there were relatively few cases that fell within that category.

As to question six, the purchase price is the price listed on the invoice.

You have to take individual cases as to the freight basis, the octane rating, and the destination.

As to question seven: The invoices usually showed the freight basis, and in many instances gasoline purchased in East Texas had a freight differential deducted from the total invoice. In other words, a purchase in East Texas at a certain rate would be calculated to get the amount of the gasoline at that rate, and that is the rate we used. Now, there was a freight differential, which runs anywhere from $12 to $13 or $13.50 a car deducted. The purchaser, in other words, gets the benefit of that difference in that freight rate. They buy it as though it was purchased in the Mid-Continent area, as far as freight rates are concerned.

In other words, if I had $1,000 to buy gasoline with, I could buy the same amount from East Texas that I could in Oklahoma, although the distance would be farther from Chicago, providing the rate of purchase was the same. They deducted the $13 or whatever it was from the invoice price. We didn't attempt to take the net invoice price and divide it by the number of gallons to get the exact purchase price. We took the price as it was listed on the invoice itself.
1713 There is a freight differential there that would make these figures all a little bit different, of course. It doesn't figure out in eighths or sixteenths; it is just a flat figure that is deducted from the total invoice.

On questions eight and nine: I couldn't always give the specification of endpoint or gravity from my work sheets. In many instances the purchase orders possibly as a whole paragraph, described the gasoline. I then decided whether that was regular gasoline or third grade gasoline, and called it such, without making any copy or notation as to whether it was 62 octane and below, or described as U. S. Motor gasoline or described as 60-62 gravity, 400 endpoint, or 437 endpoint, or whether, as occurred in many cases, it was described on the invoices by brand name, it was figured as third grade gasoline. 63 to 70 was regular. Above that was the premium or better gasoline. In many instances the regular was also described by the brand name. If Gulf, for instance, would buy gasoline from, possibly, Root Refining Company, and Root would bill them as so many cars of "Good Gulf" gasoline, I just considered that regular gasoline.

I think there were 10 or 15 items of 375 and 360 end-point which we classified as third grade.

If the octane rating was over 70, we didn't consider it; and if it was 62 or under, we called it third grade. If it was 63 to 70, we called it regular grade. If there
1714 were any 70 to 73 octane, we left those out. 65 octane
would have been classified as regular grade. During that period when the octane rating was 63 to 70, it would have been classified as regular. After April 20, 1936, if there were any 63-70 octane, we would have left that out, because the octane rating after that point was 68-70 for regular. If there were any that we had any doubt about, we didn't take them into our calculation.

Question ten is destination. I didn't consider destination in my work sheets. I think I have destination in most cases, on every one of those 20,000 cars in my work papers, but I didn't consider that in these tabulations. Usually, the invoice shows where it has been shipped to.

You can take any one of those purchases that are above the low, and determine what month it was purchased in, and who bought it, from that Exhibit. Now, then, you can go to those purchases and find the purchases during that month, and you will find those.

We took all the material they presented here under subpoena, and determined from that material. In some cases there were letters that affected the situation, and telegrams; but ordinarily it was the purchase orders and the invoices that we used. Now, the only material we have is the material that is in these files as presented here; we didn't go outside of that, naturally.

1715 I believe there may possibly have been some purchases included from independent refiners that were not named in the indictment. I am not positive of that, but I can check up on that and give you the names of any that are not named in the indictment.

By Mr. Gray

I considered Gulf purchases from the Root refinery in my compilation. Root Refining Company is classified as Mid-Continent area. I believe it is located somewhere in Louisiana. I do not recall just now whether it is in Shreveport, but it is not in East Texas.

By Mr. Horween

I have taken into consideration in my tabulation all the purchases of Globe Oil & Refining Company. I do not recall just now whether there were any f. o. b. Kansas points. If those invoices have been submitted here we have taken them into consideration. I believe there were some purchases from Vickers.

By Mr. Donovan

In classifying this material as to third grade or regular, I did not take into account the gravity, vapor pressure and gum content of the material purchased. I did not check those. I am afraid I cannot answer whether or not it is a fact that, in general, in those cases where the prices paid were over the low of the journals, the specifica-
1716 tions as to gravity, vapor pressure and gum content
were more rigid than in those cases where the prices were not above the low.

In my examination of these records I found that in most cases purchases were for shipment within 15 days. However, there were a few instances, I think I mentioned one this morning, where the shipments were made over a period of 3 or 4 months. I do not recall very many such instances. In fact, I do not recall more than that one right now in which the shipments were for a period of more than 2 weeks or 15 days.

I have 9 cars shipped by Anderson-Prichard to Skelly Oil Company in August, 1935. The first shipment of those 9 cars was on August 1st, and the last one was on the 23rd. That is 23 days. That is more than a period of 15 days.

That is not one I had in mind. I do not have any in mind. There are so many that I just can't recall them. The only one I had in mind was the one I referred to this morning in which there was a purchase of 200 cars. They were spread over a period of 2 months.

I have 5 cars shipped by Anderson-Prichard to Skelly Oil Company in September, 1935; 2 on the 3rd, 1 on the 12th, 1 on the 13th, and 1 on the 28th. That last one could possibly have been carried over from the preceding month.

I do not have the purchase orders on those. If they
1717 were, the shipping period on that purchase was the
3rd to the 28th. That is 26 days. I know there were 5 cars shipped over a period of 26 days, but I don't know when they were ordered. I do not have the purchase order on that particular one in this company. I know the

shipments were over that period. Those were taken on a shipment date basis and not on the date of purchase.

I have 1 shipment on November 19, and 1 on the 30th, and 1 on December 3rd, from Anderson-Prichard to Skelly Oil Company. I have no purchase order for them. I don't know on what date the purchase was made. It could be for a period over 15 days.

I have the purchase by Skelly Oil Company from Anderson-Prichard of 8 cars over a period from June 3 until June 24, 1935. That is over 15 days. I don't have the purchase order for that.

I have a purchase by Skelly Oil Company from Anderson-Prichard of 8 cars showing shipments between July 2 and July 24. That is 23 days. I don't have the purchase order for that.

I have not included in my tabulation for Skelly Oil Company any purchase by that company from Russell Refining Company in February, 1936. I do not have a record of that. I do not recall that we examined those invoices.

I have a purchase by Standard of Indiana on No-
1718 vember 5, 1935, of 50 cars from Waggoner Refining
Company. I have included those in my tabulation.
I think that was for the remainder of November. The date of the purchase order was November 5 so that was over a period of 15 days. It amounted to almost a month.

I have a purchase by Standard Oil Company of Indiana from Waggoner Refining Company, the date of purchase being February 4, 1936, of 35 cars. It may be true that 35 were ordered and 34 shipped, but my record indicated 35. The purchase order indicated that those should all be shipped by February 29. That was over a period of 15 days. My figures there were taken from the purchase order. We attempted to check the voucher to see how many were actually shipped. We may have made a mistake on that particular one. This work was done by several individuals, and I did not do this particular one myself, so I cannot say that they checked each individual car against that purchase order. This was all done under my direction and we attempted in all cases to have the practice established of checking.

I have purchases by The Pure Oil Company on June 3, 1935, from Omar Refining Company of 25 cars. The shipping period was from June 7, 1935, until July 1, 1935. That was more than 15 days. Those shipments are included in the month of June in this schedule, although 1 was shipped in July.

1719 I have 20 cars shipped by Cushing Refining & Gasoline Company to Shell Petroleum Corporation over the period of March 7 to March 18, 1936. I don't have that purchase date; I used the invoice dates in that case. We included in our tabulation this shipment of 20 cars. I do not know in what month they were ordered. The shipment was between the 7th and the 18th. All shipments in March from Cushing to Shell amounted to 33 cars. I don't have the purchase date. If that was all bought on the same date, it was for a period of more than 15 days. If that was all bought on March 7, or prior, it would necessarily have been over more than 15 days, because some of the shipments were on March 25. I don't know whether it was for 15 days or less. I haven't seen the purchase order. Those were all included in our tabulations in March.

I don't have anything for April 10, 1936, about 40 cars from Cushing Refining & Gasoline Company. I don't have the purchase order date. The shipments in April were from April 8 through April 29. That was more than 15 days. There were 40 cars.

I have 23 cars shipped in January, 1936, on a purchase on January 7 by Shell Petroleum Corporation from Bell Oil & Gas Company of 25 cars. There may have been some part of that shipment early in February. I
1720 have 23 cars. I have also 4 cars on February 1, so
they may have been purchased the same date. The date, January 7, was the date we used for making our comprison over that whole period.

I have a purchase on February 5, 1936, by Shell Petroleum Corporation from Bell Oil & Gas Company of 25 cars. I included that in my tabulation. Those cars were shipped over the remainder of the month through the 29th and it went over into the next month. The last one, I believe, was on March 7. The purchase order was dated February 5. I checked against that purchase order. The shipping period was about 30 days.

I have included in my tabulation a purchase by Shell Petroleum Corporation on March 6, 1936, from Bell Oil & Gas Company of 25 cars. I think April 9 or 10 was the last date on which that order was shipped, so that it ran from March 14 to April 10. That is more than 15 days. Most of them look like they are about 30 days.

I don't believe we have included in the tabulation a purchase made by the Lubrite Division of Socony-Vacuum Oil Company from Wilcox Oil & Gas Company on April 27, 1936, of 15 cars. The reason we didn't include it was because we couldn't find the invoices for it. I don't know what the shipping period was. I don't have the information on that.

1721 I did not include in my tabulation purchases by the White Eagle Division of Socony-Vacuum on April 27, 1936, from Wilcox Oil & Gas Company of 15 cars. I didn't include any of those Wilcox invoices on White Eagle, because I couldn't find the invoices. I think I have a record of about 245 cars that were purchased from them, but I couldn't find all the data to support those purchases.

I have the information on a purchase by the White Eagle Division of Socony-Vacuum from Champlin Refining Company. I don't have the date of July 18, 1935, of 20 cars. I have 1 purchase on the 20th and 1 on July 22 from Champlin. On the 20th there were 11 cars and on the 22nd, 9 cars, but I don't have that July 18 date. I have a different date. I determined July 22 in 1 instance and July 20 in the other to be the date on which I compared the price. I don't recall whether I took it from the purchase order. In some instances with Socony-Vacuum I took that information from letters.

The sentence at the masthead on Exhibit 730 is, that spot shipment is defined by trade practice as Gulf Coast bulk market for shipment in 90 days; all other markets for shipments in 10 to 15 days. These were not Gulf Coast shipments that you have been asking me about, they were all Mid-Continent except that 200 cars. I believe that was a Gulf Coast shipment. That was 200 purchased by the Gulf Company over a period of 4 months.

1722 I didn't check the indictment in this case. I compiled these figures as requested to do so. I didn't have the books of the companies. I had the invoices.

By Mr. Morgan

The caption to Exhibit 748, I think, has been changed. There has been a word crossed off on Exhibit 748 which hasn't been changed on Exhibit 749. In its final form, it is on Exhibit 748: "Prices paid by defendant companies, exclusive of Sinclair Refining Company, for third grade gasoline purchased from independent refineries in East Texas, compared with low quotations published in Platt's Oilgram for the date of purchase, during the period, March 1, 1935 to April 30, 1936." That means compared with the low of Platt's Oilgram at the date of purchase. That is the comparison that I made in what follows in the body of the Exhibit. When I had the date of purchase, I used that. I used the date of purchase regardless of whether the shipment was made at that time or at a later time.

The caption in Exhibit 749 is the same, with the exception of "Chicago Journal of Commerce."

I have some purchases of gasoline by The Texas Company from Trio Refining Company which were shipped in May. I don't have the purchase order dates here. I don't have May 7, 1935 as the date of a purchase 1723 of 10 cars of gasoline by The Texas Company from Trio Refining Company. I don't recall now whether I had that available to me. I don't recall whether all the purchase orders were submitted among the impounded documents of The Texas Company, including this one. I didn't work this one myself. I just don't remember it. I didn't examine the purchase orders for The Texas Company personally.

I think there were 50 cars purchased by The Texas Company that were not based on Platt's low, date of shipment. If they are based on Platt's Oilgram, it is included in a separate classification on the Exhibit 748.

There is no price comparison where the price is based on Platt's date of shipment. Where the price is based on Platt's Oilgram, we have made no comparison as to whether it was over or under.

The purchases of The Texas Company were not made as of Platt's Oilgram, date of purchase, so far as I know. They were made on date of shipment. There were 1,305 cars which were purchased on the basis of Platt's Oilgram alone.

If I used just that portion, I believe The Texas Company have 50 cars included in the upper portion of Exhibit 748. The 50 cars were not purchased on the basis of Platt's low so for that reason they are included up in this group, the upper portion. That shows with 1724 reference to the other cars that The Texas Company purchased that 50 cars were purchased at the low, but I don't show on here from whom they were purchased. It shows that the 1,190 cars were purchased on the basis of Platt's low. It shows under a sub-caption that the cars purchased on the basis of Platt's Oilgram low were 1,305 cars. Included in that 1,305 were 1,190 of The Texas Company.

With reference to The Texas Company purchases, Exhibit 748 shows there were 50 cars purchased at a specific price, which was the low of Platt's Oilgram; and those 50 cars are not included, of course, in the other total, which shows the cars that were purchased on the basis of Platt's quotation. In other words, when the purchase orders were issued for those 1,190 cars, the statement in the purchase orders was that the governing price would be the low of Platt's Oilgram on the date of shipment. Therefore, we didn't make any attempt to distribute that in this classification, which shows cars purchased on the low, or above or below, but we do show how they were purchased. We show in a separate classification just exactly what basis they were purchased on; that they were purchased on a basis of Platt's low.

Redirect Examination by Mr. Lewin.

As to the amount of purchases made by The Texas Company each month during that period, on the 1725 basis of the low of Platt's Oilgram on date of shipment, in March, 1935, there were 25 cars; April, 40 cars; May, 40; June, 65; July, 55; August, 70; September, 40; October, 40; November, 70; December, 140; January, 1936, 170; February, 1936, 155, March, 1936, 140; April, 1936, 140. They were all purchased from independent refiners in the East Texas field on the basis of the low of Platt's Oilgram on date of shipment.

Cross-Examination by Mr. Kirkland.

I don't recall that Standard of Indiana purchased after October, 1935, the payment to be the low of the Journal on date of shipment.

I can't give you the date that the change was made from these papers; but there were 495 cars purchased on a specific price, and there were 615 purchased on the basis of the Chicago Journal of Commerce quotations on the date of shipment.

By the Court

Exhibit 747 is intended to show the number of cars purchased by months in each field, East Texas and Mid-Continent, by companies, during the period from March 1, 1935 to April, 1936, 14 months. That is all that purports to show. All these figures do not include Sinclair's figures.

Exhibit 748 purports to show the price comparison, in comparison with the low quotations in Platt's 1726 Oilgram for East Texas for those cars that were purchased at a specific price, and in addition lists those cars that were purchased on the basis of Platt's Oilgram low quotations, and this schedule is divided to show this classification by months and also by companies.

Exhibit 749 is the same thing as Exhibit 748, with the exception that the comparisons are made on the basis of the Chicago Journal of Commerce low quotations rather than Platt's.

Exhibit 750 purports to show the price comparison in the Mid-Continent area with Platt's Oilgram low quotations for that area, and in addition shows the number of cars which were purchased on the basis of the Chicago Journal of Commerce quotations, and also the number of cars which were purchased on the basis of Platt's quotations. I refer to the Mid-Continent quotations for the Mid-Continent, and the East Texas quotations for East Texas.

Exhibits 751-A and 751-B reflect the prices paid in the Mid-Continent compared to the Chicago Journal of Commerce low quotations, and to that are also added the cars which were purchased on the basis of the Chicago Journal of Commerce quotations, and the cars which were purchased on the basis of Platt's Oilgram quotations, and that is also distributed by months and by companies.

(EXHIBITS 747, 748, 749, 750, and 751-A and B were received in evidence.)

1727 *By Mr. Walker*

I said this morning that I did not consider "Q" gasoline that was purchased in East Texas in making up my exhibit, and I gave the reason why I did not consider it. I stated there were about 500 cars purchased, and Platt's quoted I think two months during the year for prices on regular. I threw out the purchases that were made by any of those corporations in East Texas of "Q" gasoline. I believe Platt's Oilgram did quote on "Q" gasoline up to and including April, 1935, two months I believe in this period. My exhibit shows from March, 1935 to April, 1936. So in March and April there were quotations. I think about 500 cars was the number of all the purchases of "Q" gasoline which I examined. There were about 585 cars of "Q" gasoline purchased by Louisiana Oil Refining Corporation itself during that period from East

Texas Refining Company. That is about the figure. I am not certain. That was the only corporation buying "Q" gasoline in East Texas.

I think I showed the Louisiana Company as having purchased 1,108 cars in the Mid-Continent area. I do not have a division as to how many were "Q" gasoline. The data that I examined showed the division as to that, but I do not have the details. I threw out all "Q" gasoline in East Texas.

1728 Mr. Walker: We will stipulate that of 1,108 cars all but 11 of them were "Q" gasoline, purchased from Root Refineries and Lion.

(Documents produced by counsel for the Government were marked for identification Exhibits 755 to 821, inclusive.)

Mr. Chaffetz: If the Court please, during the recess Mr. Walker and I have been able to agree, and we stipulate that jobbers who sell leaded gasoline under the brand name of their supplier must buy the gasoline from the supplier, and are licensed to sell only the leaded gasoline of their supplier or suppliers, but there are some jobbers who are licensed by the Ethyl Gasoline Corporation to sell gasoline under their own brand name, and such jobbers can purchase leaded gasoline from whatever source they are able to obtain leaded gasoline from. Is that true?

Mr. Walker: Yes.

In making the study or comparison of the prices at which Louisiana Oil Company bought the 1,108 cars from the Eldorado, Arkansas, refineries, Root and Lion, I used Platt's Oilgram, the Tulsa quotations. I do not recall whether Platt's Oilgram quotes Arkansas quotations. We use the Mid-Continent quotations all the way through. I possibly would concede that I should have used Arkansas quotations if Platt's Oilgram published Arkansas quotations.

1729 *By Mr. Horween*

The Omar purchases by The Globe companies that were above the low were f. o. b. Garber, Oklahoma. There are 6 cars. My tabulation shows that as compared with the Journal of Commerce 33 were above the low, as compared with Platt's 32 above the low.

The Cushing purchases are all f. o. b. Blackwell, Oklahoma. I think Cushing Oil & Refining Company has a refinery at Blackwell, Oklahoma.

This gasoline was sold to the Globe Refining Company at Blackwell, Oklahoma, shipped to The Globe Refining Company at Blackwell, Oklahoma, and is f. o. b. Blackwell, Oklahoma. I see on the invoice, "Santa Fe switch".

I haven't gone into the situation as to whether or not in the case of delivery f. o. b. local points, higher prices are paid by the purchasers than are usually obtained by the sellers. I haven't heard about that in the industry. I could probably examine a lot of invoices with that in mind and establish that.

On an invoice, taken from the subpoenaed records of the Globe Oil & Refining Company, which happens to be a purchase from Vickers Petroleum Company in Kansas, the special provision as to price, in the right-hand column, is, "For Kansas destination price to be average quotation of the Chicago Journal of Commerce for 1730 U. S. Motor gasoline under 62 octane f. o. b. Potwin, Kansas. If destination other than Kansas price to be the low quotation of the Chicago Journal of Commerce for U. S. motor gasoline under 62 octane f. o. b. Group 3." On that particular order there are two different prices. However, there were no cars shipped to Kansas on that order.

I will take your word for it that all the purchases above the low, March 8, 5 cars; April 6, 5 cars; April 10, 5 cars; April 20, 5 cars are Cushing purchases f. o. b. Blackwell switch, delivery to Blackwell, but I don't know. The notation "taken into our tank number," which means taken into stock, appears on these particular invoices with relation to the Cushing purchases.

At any rate my compilation shows that Globe purchased a total of 384 cars of which 289 cars were purchased at a flat price. Of those 289 cars 33 were above the low. If those 20 cars were eliminated because, subject to my verification, they were purchased from Cushing Oil & Refining Company on this peculiar basis, it would reduce the number of cars purchased by The Globe Oil & Refining Company above the low of the Chicago Journal of Commerce by the number of those invoices.

There were 5 purchases from Cushing in April 1935, and 15 from Vickers in May, 1935 on the basis of the Chicago Journal of Commerce quotation. The latter is the one we just read, where there are two different prices, one for Kansas and one outside of Kansas. That

1731 moved out of the state. 10 cars from Olney, in December, on the basis of the low. 10 in January at the low; 10 in February at the low. 10 in March at the low; and 15 in April at the low. And then I think there were another 15 cars purchased in April which were to be shipped in May, all at the low of the Chicago Journal of Commerce.

By Mr. Denton

On Exhibits 747 to 751, A and B, inclusive, I have listed the name of Mid-Continent Petroleum Corporation. As I recall, those invoices were listed Mid-Continent Petroleum Corporation without any indication as to whether it was Mid-Continent Petroleum Corporation of Kentucky or some other state, but I am not sure. I don't know what it is, whether it is a corporation of Delaware or Kentucky that I intended to put on this exhibit. I don't know that the Kentucky company does business in the Standard of Indiana territory. I am not familiar with any stipulation that the defendant Mid-Continent Petroleum Corporation of Delaware is a refinery company, and that it didn't do business in the Standard of Indiana territory until after January 7, 1937. This Exhibit is intended to list the name Mid-Continent Petroleum Corporation of Delaware, the defendant in this case. I don't recall what those invoices said, but they were invoices that your company produced under subpoena. I read the subpoena duces tecum under which they were presented about a year ago. I don't recall that it doesn't name Mid-Continent Petroleum Corporation
1732 of Delaware the defendant in this case. I thought I had information from which I prepared these Exhibits to show that it was the defendant in this case. I don't have it here now.

By Mr. Francis

During the recess I had a chance to ascertain from my associates who assisted in the compiling of the statements whether or not in listing some of the prices paid by The Pure Oil Company, which were prices above the low of the Chicago Journal of Commerce, we took into consideration certain purchases of The Pure Oil Company of 68-70 gravity gasoline, 360 end point, which is known as illumination gasoline. I referred this morning to approximately 15 cars, and I have determined since that there were 16 cars that were so purchased. That was a mistake and oversight on our part, and we intended to take those out of our final compilation before I read it here but we did not get a chance to do so. That will account for 16 of these high prices paid in the Mid-Continent area that I read, because it is a different type of gasoline than house brand gasoline. I don't believe there are any more. There were some more of those cars purchased, but we eliminated those. I do not think there are any more.

Redirect Examination by Mr. Lewin.

I used the purchase order and purchase order date in most of the cases. Where we had no purchase order, 1733 we used the invoice. I wouldn't state it as being where the defendants didn't deliver a purchase order. It is a possibility that we may have overlooked them. We searched very diligently through the files, but didn't find them. There may have been some instances where they were returned with some of the other papers. Another case where we didn't use the purchase order date was when the invoice was dated prior to the purchase order. In some instances the purchase order appears to be more or less a confirmation rather than a purchase order, because the invoice was dated one date, and the purchase order may have been dated 3 or 4 days later. In that case we might have invoices starting before the purchase order. And then we used the invoice date of the first invoice.

When we found a car where the actual purchase was on a date other than the one on the purchase order, we used the other date, and in some cases the purchase order would be dated one date, and there was a notation that "this is confirming a telephone conversation of yesterday", and in that event we used the date previous as the purchase date.

We didn't use the purchase order where the purchase was based on a market price quotation of one of the journals for the date of the shipment. We didn't make any comparison for those particular types of shipments.

1734 There were a few cases where the prices changed over a period of shipments. The July shipments we used the invoice date of August 1st as the date, and when they changed the price, we used the invoice date, the date August 1st, for the remainder of that particular audit.

Thereupon Mr. Chaffetz offered in evidence EXHIBIT 753, a stipulation signed by counsel for defendant Boggs;

also a series of communications, being EXHIBITS 755-787, inclusive, and also EXHIBITS 788, 604, and 148.

> Mr. Thomas: We object separately to each of the documents now offered, to their reception in evidence, on the same grounds as heretofore stated relative to the reception in evidence of Exhibits 334, 335, 336 and 337, and likewise on the same grounds as objection was made to Exhibit 387-A, B and C, and other documents designated as being produced from the files of the Shell Company. These grounds appear at R. pp. 504-05, 556-57 and 727.
>
> The Court: Objection overruled. They may be received. Exception allowed.

Thereupon, Mr. Chaffetz offered in evidence a stipulation by counsel for the defendant A. V. Bourque, marked as Exhibit 820, and documents marked as Exhibits 789-819, inclusive, referred to in said stipulation.

1735 Mr. Thomas: I make the same objection to the reception in evidence of Exhibits 789-819, separately, as to each exhibit, as just made to the previous offer.

> The Court: Objection overruled. Exception allowed.
>
> (Document and stipulation referred to received in evidence, respectively, as EXHIBITS 789-819, inclusive, and EXHIBIT 820.)

Thereupon, Mr. Chaffetz offered in evidence a stipulation relative to the testimony of A. P. Ruether.

(Stipulation referred to received in evidence as EXHIBIT 821.)

Thereupon the following proceedings occurred in the presence of the jury.

> Mr. Chaffetz: Now, before concluding the Government's case, having finished with our evidence, the Government desires to make certain motions.
>
> There are certain corporations and one individual as to whom the Government desires to move to dismiss for the reasons I am about to state.
>
> Tide Water Associated Oil Company. The evidence, I think, shows that the activities charged by the Government were carried on by the Tide Water Oil Company. The Tide Water Oil Com-

pany was dissolved, and your Honor recalls having dismissed the indictment as to that company some time ago. We do not think the evidence shows the parent company, the Tide Water Associated Oil Company, has been connected up, and we move the
1736 Court to dismiss the indictment as to that company.

The Deep Rock Oil Corporation. The facts as shown to the Government indicate that the affairs—the assets and affairs of that corporation were in the hands of certain trustees appointed by the court during the period covered by the indictment, and we are satisfied that that corporation cannot be held legally liable in this case; and therefore, the Government moves to dismiss as to the Deep Rock Oil Corporation.

As to the Louisiana Oil and Refining Corporation, the facts in the possession of the Government indicate that that company's affairs were wound up after the period covered by the indictment, the corporation is no longer in existence; and the Government is satisfied that that corporation cannot be held legally liable in this case; and the Government moves, therefore, to dismiss as to Louisiana Oil and Refining Corporation.

Cities Service Export Oil Company: The facts indicate that that company was merged with certain other companies in June of 1936, prior to the return of this indictment; and that company the Government is satisfied, following your Honor's ruling in the Tide Water Oil Company matter, would not be held by your Honor in this case; and
1737 we voluntarily move to dismiss as to Cities Service Export Oil Company.

As to Journal of Commerce Publishing Company, W. C. Platt Company, National Petroleum Publishing Company, and Warren C. Platt, the Government feels that it has been unable to adduce sufficient evidence to connect up those defendants with the conspiracy charged in the indictment; and the Government respectfully moves to dismiss as to those several defendants.

(The following proceedings occurred in the absence of the jury.)

Thereupon the attorneys for the defendants W. C. Platt Company, The National Petroleum Publishing Company, Warren C. Platt, The Journal of Commerce Publishing

Company, and Tide Water Associated Oil Company objected to the above-mentioned motion of the Government as to the said defendants, and moved the Court that the prosecution be directed to proceed in the case with the prosecution against them, or, in the alternative, that the jury be instructed at the close of the Government's case to return a verdict of not guilty in favor of these defendants.

Thereupon, the Court overruled the motions of the said defendants, and allowed an exception.

1738 The Court: Well, I am satisfied, as far as the journals are concerned, both journals, there is no competent and substantial evidence in this record which would support a finding of guilty against them; and the motion of the Government is granted as to each of the defendants named by the Government, over the objection of those defendants.

Thereupon the Court granted the above-mentioned motions of the Government to dismiss as to the various defendants named by Mr. Chaffetz, and the Indictment was thereupon, by order of the Court, dismissed as to the said defendants Tide Water Associated Oil Company, Deep Rock Oil Corporation, Louisiana Oil & Refining Corporation, Cities Service Export Oil Company, The Journal of Commerce Publishing Company, W. C. Platt Company, The National Petroleum Publishing Company, and Warren C. Platt.

(The following proceedings occurred in the presence of the jury.)

Mr. Chaffetz: Your Honor may want to take this under consideration.

I am going to ask now that all documents that were received in evidence as against the defendants who were connected up, up to the point when they were offered, be now received generally against all the defendants whom the record may show have been connected up with the conspiracy.

1739 I have a list of the exhibits that were offered on that basis, and I should like to read that list into the record.

It will be satisfactory to us if your Honor reserves that ruling, and will make the instruction to the jury before the opening of the defendant's case.

The Court: Yes. All right, the jury may retire.

Mr. Donovan: May we have a reservation of our right to object to that offer, just made, instead of interrupting counsel now? May we reserve the right to object to the offer just made by counsel; that is, that these should be received as against all defendants?

The Court: Yes.

(Thereupon the jury retired from the courtroom, and the following proceedings were had in the absence of the jury.)

Mr. Chaffetz: Now, if the record may show that the Government has requested that each and every exhibit offered by the Government in this case against defendants generally, who were connected up, up to the time when the exhibit was offered—and I desire this motion to apply to all exhibits other than those that were offered only against particular named defendants—that all these documents should now be regarded as admitted against
1740 all the defendants remaining in the case; in addition—and that the jury should be instructed to consider all of those documents as having been admitted against the defendants generally.

Mr. Donovan: Your Honor, may we have on behalf of the other defendants, the same objection that we have had to these other documents, and the same ruling?

The Court: Yes. Exception allowed.

Mr. Chaffetz: Subject to further check, the Government will stipulate that the purchase orders used by the witness Miller in compiling his data and making his exhibits, refer to, or have the name on them, "Mid-Continent Petroleum Corporation", and do not state which Mid-Continent Petroleum Corporation specifically is referred to.

Mr. Denton: Of course, they do show, as you know that they were shipped to certain division points in Kentucky.

The Court: They do show the name of the Mid-Continent Petroleum Corporation?

Mr. Denton: Right.

The Court: And that is all?

Mr. Denton: And they show a lot of other details.

Witness Miller: The name that is printed on here is "Mid-Continent Petroleum Corporation". Now, 1741 here is one, the typewritten information is, "Ship to Mid-Continent Petroleum Corporation of Kentucky," This other one is the same.

Witness Miller: The shipping instructions just have "Mid-Continent Petroleum Corporation" printed.

Mr. Thomas: I move the Court that the prosecution be required to produce and have marked for identification the grand jury testimony of the witness Jacobi, which was used for the purpose of refreshing recollection in the course of his examination, in order that the defense may have it before presenting their case to the jury.

And I make a like motion with reference to the transcript of testimony of other witnesses, where it was used for the purpose of refreshing recollection while they were testifying before the Court.

The Court: Your motion is denied.

Mr. Thomas: And may we note an exception, if your Honor please?

The Court: Yes.

(Thereupon, on motion of the Government, Exhibits 171 and 172 were withdrawn from evidence with leave of Court.)

(The following proceedings occurred in the presence of the jury.)

Mr. Chaffetz: I have now the list of documents, the list of exhibit numbers that I referred to in my 1742 motion last evening. They are the exhibits listed here to which I referred, and it is those exhibits which I now wish to have your Honor instruct the jury to regard as having been admitted as against all of the defendants, and I ask that these exhibit numbers be read into the record.

I might say that as to these exhibits all of them were originally offered against the defendants generally who were connected up, up until the time of the offer. Some of them, namely, the documents signed by the defendant Warner, those Warner reports, were offered generally, but at the time the Court limited them to the defendant Warner, and reserved ruling as to whether they would be admissible as against the defendants generally.

We think now, in view of the Government the conspiracy having been established, they are admissible generally in the same way like the other reports, like the Shell reports, the Buckley reports, the Jacobi reports, are admissible generally as against the co-conspirators if made in the course of the conspiracy by one of the co-conspirators.

May I have this list of exhibit numbers included in the record as part of my motion.

The Court: You may.

1743 Mr. Chaffetz: I have given a copy of it to opposing counsel.

(The following is the list of exhibits presented by Mr. Chaffetz:)

11-23, 25, 26, 29-32, 35, 36, 39, 40, 42, 47, 54-68, 73, 75, 76, 86-88, 94-96, 98-118, 120, 122-127, 173, 176-183, 194, 197-204, 210, 212, 214, 215, 217, 218, 221, 222, 232-235, 237-240, 246, 250-254, 256-260, 262, 267-281, 284-287, 292, 294-296, 334-336, 345-347, 350-353, 356, 358-360, 365, 369, 370, 415-417, 421, 424, 426, 430, 432, 442, 450, 454, 456, 478, 481-483, 485, 487-509, 516, 681-707.

Mr. Thomas: If the Court please; last evening the defendants having reserved the right, with the permission of the Court, to object to the offer made by Mr. Chaffetz of the documents heretofore offered in evidence in the course of the trial, a list of which has this morning been filed with the Court and given to the reporters, the defendants, and each and all of them, object to said offer on the same grounds set forth in the objections made to the reception of each of said exhibits as they were offered in evidence, and upon the further grounds:

1. Because statements in said documents purporting to state facts are not competent evidence of the facts, of said alleged facts so related in said exhibits, or as to the truth or falsity of such statements, and the truth or falsity of such statements has not been established by any witness, and the Government has failed to offer any proof in support thereof, without any showing that such proof could not be supplied by witnesses who would be subject to cross examination by the defendants. 1744

2. Because as to all intra-company correspondence and writings there is no proof that the writer or the recipient of such documents so now offered was in any wise authorized to or in fact represented

any of the other individual or corporate defendants, and as to all other individual and corporate defendants except the writer of the letter and the corporation employing him, or of which he is an officer or employee are incompetent as hearsay.

3. Because as to such intra-company correspondence or writings listed in said exhibits and claimed to contain admissions or declarations of a co-conspirator, such are incompetent for the purpose of proving that any other defendant, individual or corporate, was a member of the alleged conspiracy and as to all such other defendants, individual or corporate, such declarations and admissions are hearsay: and

4. Because, as pointed out in the course of the trial when certain of these exhibits were offered, they
1745 show on their face that many of the statements made therein are hearsay and incompetent.

The Court: The objection is overruled. I will say to the jury during the trial of the case the exhibits just received now were received with certain limitations. They are now received generally as against all the defendants. Exception allowed.

> (EXHIBITS mentioned in motion of Mr. Chaffetz are received as evidence against all the defendants generally.)

Mr. Morgan: If the Court please, on behalf of the Texas Company and the other defendants I represent, I move the Court to instruct the jury that they cannot be considered against any of these defendants, for the reason that there is no evidence, no competent evidence before the Court connecting The Texas Company with any alleged violation of the law set forth in the indictment.

The Court: Your motion is denied. Exception allowed.

Mr. Morgan: Now, in the alternative I move the Court to instruct the jury that none of that evidence, evidenced by the exhibits just offered generally in evidence and received under order of the Court, may be considered as against The Texas Company or any of the defendants I represent for the purpose of determining as against them the existences of any
1746 conspiracy, or the connection of them or any of them with any alleged conspiracy.

The Court: At the proper time the jury will be properly instructed as to that. Exception allowed.

Mr. Francis: May it please the Court, may those two motions be assumed as applicable to each of the several defendants, so as not to require each one of us to get up and make like motions?

The Court: Yes, that motion is made for and on behalf of all the defendants.

Mr. Chaffetz: The record shows that Exhibit 782 was withdrawn upon order of the Court.

(Exhibit 782 withdrawn.)

Mr. Donovan: If it please the Court, before the Prosecution closes, I would like to recall to your Honor's mind that at the time that I offered the Code and the Executive Order of the President in evidence, you said to me that you wanted that to pass for the time, and that at a later date I might make application. I do so now, for this reason:

There are several things that have happened since I first offered the Code in evidence. Some that occur to me now are these:

1747 There has been discussion of refinery allocations, and reference to the Code in reference to refinery allocations. There have been introduced in evidence the various contracts between the major companies and the jobbers; and, if your Honor had had the time to examine those contracts, you would have found that most of those contracts—I think I am accurate in that statement—most of them refer to the fact that these contracts relate to the Code of Fair Trade Practices of the Petroleum Industry; so that, if we come to consider those contracts on argument, they cannot be understood without reference to the Code itself.

Now, in addition to that, your Honor, there were references to various other matters under the Code; such as, for example, the setting up of committees under the Code, the P. & C. Committee, and the P. A. B.

Now when we come to our argument on these motions, it would seem to me that the Court can do one of two things: Either take judicial notice of that Code and of the Executive Order signed by the President, or it can have it in evidence.

And I desire at this time, for the reasons that I have said, to renew my request to have the Executive Order, Exhibit 709, and the Code, Exhibit 710, received in evidence.

1748 The Court: I will deny your motion at this time; but the Court will take judicial knowledge of the Code for the purpose of motions for a directed verdict, and with your right to renew your motion to offer it later on. Exception allowed.

Mr. Crawford: The Government now rests.

(The following proceedings were had before the Court, the jury being absent from the Courtroom.)

Mr. Donovan: May it please the Court; Mr. Thomas and myself desire to file a motion to strike on behalf of all defendants that we have enumerated here in this motion. I desire to file it with your Honor now (handing document to the Court).

Mr. Horween: If the Court please, I ask leave to have the record show that Colonel Donovan's motion and the arguments may apply equally to the defendants I represent as well.

The Court: The record may show that.

(The said Motion to Strike was thereupon filed with the Court. Thereafter the Court denied said Motion as shown at R. p. 912. Said Motion to Strike related to a large number of exhibits introduced in evidence by the plaintiff. At the close of all the evidence the defendants filed a Motion to Strike the same exhibits mentioned in the Motion to Strike filed at the close of the plaintiff's case.)

Thereupon Mr. Wood moved the Court in behalf of the defendant J. W. Carnes as well as the other defendants to strike out all the testimony of the witness Jacobi, in-
1749 cluding particularly the testimony as to the meeting at St. Louis and at subsequent monthly meetings, and all evidence of conversations between Jacobi and McDowell and Tuttle, in which prices were discussed; and all evidence of conversations between Jacobi and Smith, Chamberlain, Nagle, Gartman, and Evans; and all conversations between Jacobi and Tracey; and all evidence of Jacobi as to purchases, if any, made upon a plan and as to the quantities purchased by the several companies. The motion was made as to all testimony of Jacobi in the aggregate and as to each item.

Mr. Wood: The grounds of the motion are that if this evidence is offered against the defendant Carnes as evidence tending to connect him with the conspiracy that it is inadmissible for this purpose, because it consists of conversations or acts done out of his presence and without any other evidence connecting him therewith.

Second, that if admitted for any other purpose it is inadmissible because unless and until the defendant Carnes has been connected with the conspiracy by competent testimony the acts and declarations of others, even though it may be assumed that they are co-conspirators, are inadmissible against him for any purpose.

It was thereupon stated by Mr. Donovan that the motion made by Mr. Wood should be taken as made for all
1750 of the defendants so far as applicable.

Thereupon motions to dismiss and for directed verdict were filed by the following named defendants: Socony-Vacuum Oil Company, Inc., Charles E. Arnott, Charles L. Jones, Bryan S. Reid, H. T. Ashton, R. R. Irwin, Wadhams Oil Company, A. G. Maguire, Shell Petroleum Corporation, Alexander Fraser, P. E. Lakin, Empire Oil and Refining Company, Cities Service Company, O. J. Tuttle, H. E. Brandli, Harry D. Frueauff, Edward L. Shea, Noel Robinson, J. W. Warner, R. O. Audrain, Sinclair Refining Company, J. W. Carnes, Dan Moran, Harry J. Kennedy, L. T. Cramer, Continental Oil Company, Barnsdall Refining Corporation, E. B. Reeser, The Pure Oil Company, Henry M. Dawes, C. B. Watson, R. H. McElroy, Jr., Dewey K. Chamberlain, The Texas Company, W. S. S. Rodgers, R. D. Cottingham, H. W. Dodge, P. C. Scullin, John A. Welch, Gulf Oil Corporation, Gulf Refining Company, Standard Oil Company (Indiana), Allan Jackson, Edward G. Seubert, Edward J. Bullock, Ira A. Smith, Phillips Petroleum Company, Frank Phillips, A. M. Hughes, H. A. Gardner, F. L. Koopman, Skelly Oil Company, W. G. Skelly, James Nagle, Jacob France, Robert W. McDowell, Thomas Fitzgerald, Mid-Continent Petroleum Corporation, The Globe Oil and Refining Company (Illinois), The Globe Oil and Refining Company (Oklahoma), The Globe Oil and Refining Company, (Kansas), I. A. O'Shaughnessy, Arthur V.
1751 Bourque, and Clyde M. Boggs.

Thereupon, counsel for the Government and counsel for the defendants presented to the Court their arguments on motions to dismiss the indictment and for a directed verdict.

During the course of such arguments Mr. Chaffetz made the following statements:

"When we were before your Honor in connection with the arguments on the demurrers we took the position that this was a price-fixing case, and that we relied in this case on the Trenton Potteries case, that the indictment in this case was framed on the theory of the Trenton Potteries case. That argument of the Government was sharply contested by the chief counsel for the defense, and others, and counsel read at great length at that time from Chicago Board of Trade case and the Appalachian Coal case.

* * * * *

"Now, our position at the time of the argument on demurrer was that this was a price-fixing case, and it still is.

"We think we have shown conclusively that there was nothing of importance involved in this case than the fixing of prices. There were some other incidental effects and results. The independent refiners were benefited. * * *

1752 "Then we say to your Honor that the rule of law applicable to this case is the rule of law laid down in the Trenton Potteries case, and that the only issue, the only issue for this jury is whether or not the defendants did conspire to raise and fix the level of those tank car prices. If they did, under the statute they are guilty, and the burden is not upon the Court or upon the Government to inquire into the reasonableness of the prices fixed.

* * * * *

"Our argument is this: That they controlled, regulated and fixed that tank car price at a level agreed upon among themselves, a level that they wanted to maintain. And, under the law, that action is illegal, under the Trenton Potteries case."

After hearing arguments on the said motions for directed verdicts, the following proceedings occurred in the absence of the jury:

The Court: I don't think I want to hear any further argument. I have considered the briefs submitted last night by Colonel Donovan, and spent two days and a half now arguing this question. The Court is of the opinion that there is competent and substantial evidence in this record to sustain the charges in the indictment that there was an unlawful agreement and combination entered into by a number of these defendants, and I don't feel that

1753 I would be justified in taking this case away from the jury and finding, as a matter of law, that the defendants did not so combine. Exception allowed.

However, the Court will—the Court has some doubt in its mind as to whether some of the defendants actually participated in this combination and alleged conspiracy, and as to those, I will hear arguments on those later this afternoon.

Thereafter, further arguments were made by attorneys for defendants and attorneys for the plaintiff and thereafter the following proceedings occurred:

The Court: I have had time to consider the motions in behalf of the Gulf and the Texas Companies, the officers of The Texas Company; and the Court has concluded that your motions for a directed verdict for both Gulf Companies, for The Texas Company, and the officers of The Texas Company, should be granted, and will be granted.

(Judgment granting motions for directed verdicts as to the defendants named and entering verdicts of not guilty as to each said defendant is printed, ante, page 2473 of the Record.)

The Court: I have been giving this matter some consideration, and the Court is of the opinion that there is competent and substantial evidence in the record to support a finding of guilt as far as the 1754 other corporate defendants are concerned. Motions for directed verdicts denied. Exceptions allowed.

Now, as to the individual defendants, that has given me very much concern, and while there is substantial evidence in the record to support a finding of guilt as to a number of them, I want to give that motion more consideration, and I shall withhold and reserve my ruling thereon until some later time.

Mr. Thomas: If the Court please: I understand the ruling of the Court to be that the motions to strike are all denied?

The Court: That is correct.

Mr. Thomas: And, with the permission of the Court, I would like to have this exception:

We except to the ruling of the Court denying each and every of the separate motions to strike, which motions are in writing and on file with the Clerk; such exception being made to the ruling of the Court, separately, as to each exhibit, and, likewise, separately as to the testimony received relating thereto as set forth in said motion papers, said exception being made on behalf of each and every defendant, individual and corporate, in whose behalf said motions were made, separately, and not as a group, with the same force and effect as if this exception were repeated in the record as to 1755 each exhibit so listed and as to the testimony relative to each such exhibit, each and every defendant, individual and corporate, objecting for himself or itself, as the case may be, with the same force and effect as if this exception were repeated on behalf of each and every defendant in behalf of whom the motion was made.

Now, if the Court please, in view of the fact that the ruling of the Court with reference to some of the motions that are pending with reference to the dismissal of some defendants is reserved, may it be understood that the defense may reserve the right to make exceptions to the rulings after such time as the Court announces his decision?

The Court: It may be so understood.

Mr. Thomas: And at the same time, can we make the exceptions with reference to the rulings as to the corporations, or shall I go through that—

The Court: You have already made your exceptions here, haven't you?

Mr. Thomas: No, I will have to make a separate exception as to each corporate defendant, your Honor, in order to comply with the rule laid down by the Circuit Court of Appeals for the Seventh Circuit.

The Court: This last one you have made just now, related to your motions to strike the evidence?

1756 Mr. Thomas: Yes.

The Court: Oh, yes, you may have that reservation.

Mr. Thomas: I thought we could probably do it better if, after the Court announces his ruling, we could except for the corporations and the individuals who are left in the case.

Mr. Francis: So I understand it, your Honor, as to the individual motions not passed upon by the Court this time, as to which you have reserved ruling, the procedure forward is without prejudice to those motions while you have them under advisement; isn't that correct?

The Court: That is right.

And thereupon the defendants, to maintain the issues on their part, called the following witnesses and introduced the following testimony, to wit:

1757 WIRT FRANKLIN, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Ardmore, Oklahoma. I am 54 and have been an independent oil producer for about 25 years. I never have been connected with a major oil company.

(The witness describes his education and early employment and how he became an oil producer.)

I got into the oil business rather accidentally. In driving over the southern Oklahoma country, I had noticed indications of oil in water wells and outcroppings of asphalt. The discovery well of the Healdton Field was brought in in August, 1913. A hundred-barrel well is a well capable of producing and producing about 100 barrels per day. That was the first real discovery of oil in southern Indian territory.

(The witness then named the various oil fields in Oklahoma and North Texas where he operated as an independent producer. Such statement is omitted because it is immaterial to the issues on this appeal.)

As a producer, I have become familiar with the production methods and activities in the East Texas and other fields. I have been in those fields. However, I have had no operation of my own in East Texas.

1758 In the refining end of the business I was one of the six to organize the Cameron Refining Company at Ardmore, Oklahoma, about 1916. It operated on crude from the Healdton and Cushing fields. That refinery continued to operate uninterruptedly until March, 1935, when it was shut down because it could no longer break even on its operations. We made use of our own crude. The percentage of our own crude varied; at times we had enough production to more than supply the refinery, but it wasn't always located adjacent to our gathering line so that we could collect our own oil. Sometimes we found it cheaper to sell our oil, and buy other oil in place of it that we could reach with our gathering line.

I did not participate actively in the operation of this refinery as I am not an expert refiner. My company had a vice-president who was in charge of the refining operations, but I kept track of them very closely.

As an independent oil producer I have been connected with the Independent Petroleum Association of America. That is an organization of independent oil men that was formed in June, 1929, at the Colorado Springs, Colorado conservation conference that was called by President Hoover. It was organized principally to protect the domestic independent oil men from imports of foreign oil. It developed at the Colorado Springs conference that certain elements in the industry proposed to shut in the American production and save it for some future national emergency, which meant absolute destruction to the
1759 whole Southwestern part of the United States, whose
civilization was built on oil. And when that developed, the independents there organized to protect themselves from such a move, and instead demanded of Congress the limitation of imports of oil, and a tariff on imported oil equal to the difference in cost of production of the foreign and the domestic product.

I was also president and organizer of the Ardmore Oil Producers Association, organized in 1914 when the Healdton and Cushing fields in Oklahoma had great overproduction and waste. Demoralized conditions occurred, the price of oil went to 30¢ a barrel, and we organized for self-protection.

I was president of the Independent Oil Producers Association from its organization in June, 1929 until November, 1935.

I was a member of the Oil Code Authority, the Planning and Coordination Committee, from September, 1933. The Planning and Coordination Committee was the Oil Code Authority representing the oil industry in the administration of the Oil Code. It was appointed by President Roosevelt in 1933 from nominations made by different groups within the oil industry. It was composed of 15 members, 3 of whom, appointed by the President, represented the Government, without vote, and 12 of whom were appointed from the oil industry.

The duties of the Committee were to plan and make recommendations to the Petroleum Administrator for the administration of the Code, to coordinate the activities of the industry; to cooperate with the state authorities
1760 having jurisdiction over the regulation of the output of oil and proration matters in the several oil producing states; and generally to aid the Administrator in carrying out and obtaining the objectives of the Code

and the National Industrial Recovery Act under which it was created.

As president of the Independent Petroleum Association of America I took quite a leading part in the formulation of the Code, in the presentation of the Code to General Johnson, National Recovery Administrator, and in the hearings on the Code at Washington; and then I was one of those nominated by the Independent Petroleum Association to the President for appointment, and I was appointed by the President, as were all of the other members of the Committee.

I was elected the first chairman of the Committee. At the beginning of the Code, we made the term six months with the purpose of rotating the chairmanship. I held the office during the first six months of the Code, retiring as Chairman on March 15, 1934.

I continued my work as a member of that committee, and was then appointed chairman of the Production Sub-Committee, which position I held until the expiration of the Code. That Committee had charge of recommendations on all matters pertaining to the production and the withdrawal of oil from storage. It assisted in the work of balancing production with consumptive demand, and it had charge of all other matters relating to production, particularly of recommendations about the orderly and
1761 planned development of new pools.

We have always considered that the Code expired with the Schechter decision of the Supreme Court, May 27, 1935. The Committee continued to function for a few days after that, but more to wind up its affairs than anything else. We realized that that decision meant that we no longer had authority.

As a member of the Planning and Coordination Committee and as president of the Independent Petroleum Association of America, I studied the problems of the oil industry in the United States. Our study had to cover the entire operations of the oil industry: production; conservation of oil; regulation of the production by the state authorities; balancing production and consumption, and in that connection we had to take into consideration imports and withdrawals from storage; and all the factors generally that were necessary to accomplish our objective. That objective was the stabilization of the oil industry on a profitable basis so that we could pay the wages and comply with the hours of employment provisions, and could re-employ those who had lost out during the demoralized state of the oil industry in the years preceding. Generally, it was to carry out and secure the objectives of the Code and of the Act of Congress under which it was formed.

Conservation, as it is understood in the oil industry, is a rather broad term. We don't understand by conservation the hoarding of oil in the ground, but rather its
1762 production without economic waste; its wise use; and its use for its higher purposes rather than for burning under boilers, where some other fuel could just as well be used—all this so as to obtain the greatest ultimate benefit from our reserves of petroleum; to make them last as long as possible; and to make them accomplish as great a good for our civilization as could ultimately be obtained. Conservation also takes into consideration the prevention of underground waste and the waste of the reservoir energy from the pool, which is the propulsive force that causes the oil to flow to the surface. By wise conservation we have found, in recent years, that the ultimate recovery of an oil pool can be doubled or trebled by proper handling, and proper development and operation methods.

Crude petroleum is a liquid mineral oil. It varies in its component parts considerably in the different areas and fields in which it is produced. It is generally composed of hydrogen and carbon, or hydrocarbons, as we refer to them, and at times has foreign substances in it, such as sulphur. Crude oil is either of an asphaltic or a paraffin base, or sometimes of a mixed base. It varies in color from black, amber, various shades of green, and brown. I have seen some crude oil come from the ground white, white as gasoline.

It varies in volatility considerably. Some oils of a heavy asphaltic base are thick or viscous. Those heavy oils usually contain a very small percentage of gasoline. Other oils are light or very volatile. The very volatile or
1763 high-gravity oils contain greater percentages of gasoline, kerosene, and the lighter constituents of petroleum, which are the most valuable.

In its natural state crude oil contains gas. When it is confined under pressure in the ground, there is considerable gas in solution in the oil.

Gravity is the measure or yardstick to denote the weight of the oil as compared with water. Oil is lighter than water. This gravity does not refer to specific gravity, but to Baume gravity, more recently called A.P.I. gravity. The higher the gravity, the lighter the oil, and the lower the gravity, the heavier the oil. The higher the gravity, the more gasoline content, as a general rule, and the lower the gravity, the less gasoline content.

The normal Mid-Continent crude is from 36 to 36.9 gravity. It has a very fair degree of gasoline content, depending upon the method of refining, the distillation percentage ranging from 20% to 30%, and, as you go into the higher processes of refining, a great deal more than that.

Crude petroleum is produced to some extent now in 19 states. The principal sources of supply at the present time are in the southwestern states: Kansas, Oklahoma, Texas, Louisiana, Arkansas, and New Mexico. California is a great producing state. In the eastern states, New York, Pennsylvania, West Virginia, Ohio, Indiana, Illinois, and Kentucky and Michigan produce varying quantities of oil. In the Rocky Mountain states, Montana, Wyoming and Colorado are all producing states. There has been
1764 prospecting and some oil has been found, in Idaho
and Utah.

The crude petroleum found in these different states is not of the same quality. It varies greatly in quality in the same state, and at different depths in the same pool, in the same structure.

The oil that is known as Pennsylvania grade oil is produced in West Virginia, New York, Pennsylvania, and southeastern Ohio, and is a very high grade of lubricating oil. Its gasoline content is negligible in its quality and quantity. Its chief value lies in high quality lubricating stock.

We have some fields in Oklahoma which have a high quality of lubricating content, but not so great a percentage of lubricating content. The Oklahoma City, Seminole and Burbank fields in Oklahoma have very fine lubricating content, as well as a high gasoline content..

I don't think anybody knows accurately how much crude oil exists in this country, but the estimates placed now on our total reserves in discovered and developed oil pools is around 13 billion barrels. We produce at the present time over a billion barrels a year. In the last three years consumption has increased from about 8% to 10% a year. We are now producing about 3,500,000 barrels a day.

Crude oil is found at varying depths. The first commercial well drilled in 1859 in Pennsylvania found oil at 69 feet. It has been found from that depth in different localities to more than 2 miles down. In recent years we have had to go deeper and deeper to discover new supplies of oil.

In the Mid-Continent area in recent years we have
1765 been drilling from 4,000 to 7,500 feet, and in one well
in Oklahoma, oil was found at over 10,000 feet. In East Texas, crude oil is found at about 3,500 to 3,700 feet. Those wells on the coast of Louisiana and Texas vary from 5,000 to 12,000 feet.

The cost of drilling increases at high ratio the deeper you go. The deep wells are very expensive, and some of them cost as much as $250,000 apiece when you go down to depths of 10,000 to 12,000 feet, and even more, depending on what kind of luck you have in your operations.

Sometimes we get into what are known as fishing jobs: the drill pipe twists off and gets stuck in the ground, and we have to work with fishing tools and fish it out before we can go deeper. Sometimes those fishing jobs cost thousands and thousands of dollars before you get over them, and then again, you may never get over a fishing job. After you have drilled 7,000 feet deep, you have to plug the hole and start over again. Unfortunately we have lots of dry holes and the public never hears about them.

The cost of drilling a well in Oklahoma varies with the depth. The Healdton field was developed at an average cost for wells ready to produce of about $5,000. In the Oklahoma City field, where production was found at 6,000 to 6,500 feet, the average cost of the wells drilled during the period of greatest development was $150,000.

Crude oil is found under a great variance of geological
structural conditions. The most common and the
1766 simplest form of geological structure is what is known
as the anticlinal dome. It might be likened to an inverted saucer in the structure of the earth, oval in shape, with the rocks at the different strata of the earth dipping or slanting in all directions from a high point so as to make a dome. They usually are elongated, not usually round, but they may be a mile wide, and 7 or 8 miles long.

In an anticlinal dome the form of the rocks or the structure of the rocks or the earth formation runs in an oval, or like a cross-section of an inverted saucer, as I have already described.

Now, there are geological structures which are suitable for the trapping of oil and which do trap oil. The oil is usually found in a porous sandstone or limestone. Where oil is trapped, it is always overlaid with an impervious formation through which oil cannot penetrate. It is usually known as a limestone caprock and commonly referred to as the caprock.

Sometimes, however, the caprock is not immediately above the sand, but intervening between the sand and the caprock may be a layer of shale, but shale itself is also impervious to oil when it is not sandy. Oil can't get through. Oil being lighter than water, the water is found at the base, the oil next, and gas, being lighter than oil, is found at the top. The water level is usually constant, and about the same on each side of the dome.

Oil is not found in a lake or pool. In its natural state it is found in the porous rocks, usually sandstones or
1767 porous limestones in the earth, the oil being contained
in the portions of the porous interstices between the different sand particles or stone particles. Limestone is of a honeycombed nature with cavities in it, and in those cavities oil will be trapped.

The geologists usually attempt to find a structural condition as I have described. You are never sure of it until you drill the well and find it.

Now, as a well drilled on the surface goes down, it penetrates this caprock lying above the oil sand, and if it were drilled only a few feet thereafter and not any deeper, you may find only a dry gas well. That is, at that point, at the commencement of the flow of that well, it would produce only dry gas.

However, that same well, if drilled deeper, would reach the level of the oil in the porous sand and would produce both oil and gas. It would produce a large quantity of gas, and would be a wasteful well, because the gas-oil ratio, that is, the ratio of the gas to the amount of oil produced, would be very high, which would waste the pressure from the structure. As that gas is removed and allowed to escape, the oil moves up through the sand to the bottom of the well. As the oil moves up the water at the bottom or sides of the formation also moves up to take the place of the space that was formerly occupied by the gas.

Now, there is no movement of the oil until the caprock has been penetrated by the drill. We used to think, in the early days of the oil business, that oil was in lakes or
1768 rivers or creeks, and that these rivers and creeks of
oil flowed past a man's land, and if he did not catch it as it went by it was gone. The early decisions of the courts are based upon that law of capture, and upon this mistaken idea that the oil was flowing by. We have since learned that the oil is in a static condition in the ground, trapped by the water on each side of the structure, and that there is no movement whatever until you tap it, and then the movement is started both of the oil and gas toward the open hole.

A well might be drilled at a point so that, instead of first reaching the dry gas in the formation, it strikes a point where there is only oil. But while it contains only oil, on account of the terrific pressure that is involved here, and the fact that there is a large amount of gas at the top, even here at this point, the oil would contain considerable quantities of gas in solution. This gas in solution, having the pressure released, tends to come out of the oil. So wells, in the flush days of the field, would produce considerable volumes of gas, and it is the pressure of that gas and the expansion as it comes out of the oil that helps bring the oil into the hole and causes it to flow. That would be a gusher or a flush well.

The geologist made a slight error, say of half a mile, and as a result the well may be drilled so that they get white sand with no oil in it. They would get a dry hole, and it might condemn that structure for many years before anybody else would want to drill another well in that area.

This pool might remain here undiscovered because the
1769 first well got salt water, which would prove there was
no oil in that immediate locality. We call a water well a dry hole. Nobody else would want to undertake to spend a lot of money drilling another wildcat well in this area.

Another problem you have is where you drill a well down to a point where you get oil in the top of the sand, but your production may not be as great at that point as it is at other places where these big flush wells are. You have got a comparatively small well. You say, "Well, I will drill it a little deeper into the sand, and maybe I will get as big a well as these other fellows did." So you keep on drilling, but you strike water which encroaches into your well. You have a problem on your hands, because it is almost impossible in these open porous sands to plug up the water where you have penetrated it.

There is another factor about conservation. If the flow of these wells is maintained, that is, if you maintain that pressure on the sand at all times, taking only a moderate quantity, you can prolong the flowing life of this field for years and years, so that nearly all the production will be flowed out at comparatively small expense.

On the other hand, if you allow a well to produce wide open, allowing that gas to escape and flow into the air, it is wasted; whereas if it is produced at a slow rate it can be utilized for domestic consumption.

In a well that comes in all at once, unrestrained, the tendency is to create a suction in that sand, that is, water

will be pulled up and pulled into the well and do
1770 what is known as coning. The water will form like
a cone and shut that oil out, and the remainder of that oil is left in the ground and is never recovered. That is the greatest waste that can occur, and under the competitive method of production it does occur quite often, because if one man in a common pool produces his well at full capacity, every other man in the pool is compelled to do likewise or lose the oil from under his land.

That is because of the terms of the leases and the implied covenants that the courts have put into every lease: that we are all drawing from, so to speak, a common pool or source of supply, and if one producer in a pool insists on violating the rules of safety, you might say, and preventing waste, and produces his well to capacity, then his neighbor across the fence or across the road on another tract of land that is owned by another man, must also produce his well to an equal capacity, or drainage will set up and he will lose his oil.

He has to do that or forfeit his lease. His lease is subject to cancellation if he does not produce as much oil as his neighbor. But if he does produce as much oil as his neighbor, that brings about overproduction, and permits of waste and demoralization. It results in an immediate large flush production of oil, usually beyond the capacity of the pipe line and storage facilities to handle. Before we had our conservation laws in the states and the enforcement
of proration, it caused the oil to be stored in open pits
1771 where it was subject to being washed away, and where
the lighter, most volatile constituent parts of the oil evaporated, and large seepages took place under ground, and great loss occurred. Some states haven't any conservation laws yet.

The amount of oil you usually get from an acre varies very greatly. It depends upon the thickness of the producing sand, upon its porosity, upon the pressure, and upon varying factors, so there is no rule to go by. Some fields produce only 5,000 or 6,000 barrels per acre, and others produce 100,000 barrels per acre. The average in Oklahoma will run around 10,000 to 15,000 barrels to the acre.

The term "wildcatting" is applied to the drilling of a well that is somewhat removed from a proven area, or a proven oil field, and where an attempted new discovery is in progress. Wildcats are wells that are pretty close to production, but still outside of a proven area.

As soon as a well starts flowing, it also begins to decline in production. The more rapid the flow and the greater the number of wells that are drilled into the pool, the more rapid the decline in pressure. With the decline in the pressure the production, of course, also declines.

So there comes a time in the life of every field when the
wells cease to flow, when the gas has been exhausted, or
practically so, and when the gas that is in solution with
the oil has been to a large measure released. The
1772 gas that is in solution with the oil expands when the
pressure is released and tends to move the oil along
through the porous places in the rock toward the hole.

When that gas has come out of solution with the oil, and there is no longer anything to keep that oil alive, it gets to be somewhat dead, what we call "dead oil," and it moves very slowly. It then becomes more viscous, the gravity of the oil declines, and it moves with less freedom through the porous formation.

After the well ceases to flow it is necessary to install pumping equipment to lift the oil out of the ground. The deeper the well, the greater is the difficulty of keeping it on the pump. There are many things that can happen to it.

The oil is pumped out and goes through a line over to the separator; and from the separator, by gravity into the stock tanks; and from there the pipe line company which owns the oil makes connections with the stock tanks.

After the wells get to the pumping stage, that gas has a
great deal of gasoline that may be recovered; and connections are made at the top of the tank, and this gas is collected to go to what is known as a casing-head gasoline
plant, where the gasoline is stripped out of the gas. There
are several methods of that. The gasoline is taken out of
the gas, and the gas then is returned back to the field for
operating purposes. It may be used for the drilling of
other wells or to run this gas engine here in the pump
1773 house which is pumping the well.

It is necessary to pump constantly, 24 hours a day, to get all the production.

As time goes on, even this pumping well declines, and you get down to what is known as the stripper well stage. They are wells that have gotten down to less than 5 barrels a day, and in some cases down to less than a barrel a day, so that they only have to be pumped, sometimes, an hour or two a day to get all of the oil they will produce at that stage of the game.

At this stage, of course, the operating cost per barrel very materially advances. At the same time it is very important to this nation and it is very important to the consumers as well as to the oil industry, that these pumping wells be maintained on production. When they have gotten to that stage, they are also pumping some water with the oil. If you shut down those wells from pumping, that water encroaches into the well and shuts off the oil; and after that, if they are shut down for any length of time, it is very difficult to get the well back on production of any kind. You may pump water for 6 or 8 weeks before you get any oil at all.

In the aggregate there are over 250,000 of these stripper wells in the United States, although the cost of their production is high. They are on farms, where the men live who operate the wells and take care of the pumping,
1774 the cleaning out, and the reconditioning of the wells.
The stripper wells contain about 40% of our reserves of oil; and if they are abandoned, it is a very serious problem for the whole country.

The percentage of dry holes in wildcat drilling is running now about 1 producing well in 20 drilled. It used to run about 1 in 60, but that was before we had discovered the scientific methods for locating structure that are now used, and which has reduced the number of dry holes in wildcatting to some extent, but not very greatly. It is still only about 1 in about every 20 or 25 wildcat wells that finds any oil at all; and very frequently that one may not be enough to be commercial. Taking all wells drilled, whether wildcat or on a proven field, the percentage of dry holes runs about 1 dry hole out of every 3 wells drilled, even now. It varies somewhat in different years. Sometimes 20% of the wells drilled in one year may be dry holes, while in the next year it might run 35%.

Out of the wells that come in, the producer must make his money and make up his losses on the wells that do not come in. Those dry holes are just as necessarily a part of the business as the wells that are drilled and produce, because you never know, when you start a well, whether you are going to get production or not.

These stripper wells are what is known as settled production. They operate about the same every day, day
1775 in and day out, and their decline is almost negligible
over the years. Of course, they finally get to the point where they won't produce anything but water. There are probably, at this time, about 325,000 wells altogether in the country. About 250,000 are in the stripper well class. Then there are about 50,000 more that are in the pumping class, and verging on the stripper class.

The combined production from the stripper and pumping wells averages about 500,000 barrels daily. That is very aptly referred to as the backbone of the industry, because it is a production we can rely on. The flush fields are here today and gone tomorrow, and those flush wells in a comparatively short time have to take their place with the pumping wells, and they settle on down into strippers eventually.

It is more costly to operate a stripper well than a flush well. As the production declines, the cost per barrel, of course, increases, and the lifting cost per barrel increases with the least production. If the price of oil which the operator of a stripper well gets continues for any considerable period below the cost of production, it results in the abandonment of the well.

I have made a study of the relation of the price of crude oil to conservation.

> (During an argument before the Court, counsel for the defendants made the following statement:)
>
> Mr. Donovan: I only want to make clear my position; in our view of this case, what we did was 1776 justified under the law, whether there had been a Code or not. We feel that we are entitled to show what was done under the Code, not to give us immunity from anything we feel may have been wrong—because we deny that we did anything wrong—but as showing that the intent and purpose that we were seeking to accomplish was the same intent and purpose and objective that the Government had in mind. It is not because we were in under the protection of any Code. It is bearing upon our purpose and on our intent, and we are entitled to show that.

By Mr. Donovan

There can be no conservation of crude oil in any rational meaning of the word without taking into consideration the price of crude oil. I think that is well accepted throughout all the oil producing states, and by the state authorities themselves, in the enactment of their conservation laws.

After the crude oil reaches the top of the well and is run through the measuring tanks, as a general rule, it is transported through pipe lines. The purchasing companies usually have their own pipe line facilities. In the oil fields there are gathering systems, a regular network of smaller pipe lines that connect with the stock tanks into larger tanks. From there the oil is pumped to refining centers

which may be close by. From the Mid-Continent field,
it is pumped to Kansas City, St. Louis, Chicago, points in
Ohio, and Pittsburgh. Other trunk lines run south
1777 to the Gulf of Mexico where the oil is loaded on tank
steamers and is transferred to refineries on the Atlantic coast. Some transportation from the field, especially in the new fields, before the pipe lines have been completed, is done in tank cars from the wells to the refineries, but that is the more costly method, and is only resorted to in necessity.

All the producers in the field usually have a few days' storage facilities on the leases, but outside of that it is seldom, except in cases of great emergency, that they would have storage of any consequence. I am speaking in this as to both the ordinary independent producer and the larger ones.

The independent producer as a general rule has facilities of storage for 8 to 10 days' production at the outside. To build the large storage tanks costs about 25¢ a barrel of storage space.

The independent producer who has not sufficient facilities for storage must sell the crude oil that he produces from day to day on a day to day basis if he continues to produce his allowable share of the production from the common pool.

In order to take care of that, the oil is sold under what
is known as a division order. That is a contract between
the operator of the oil wells and the purchaser who usually
owns the pipe lines that connect to the stock tanks. That
division order sets up the division of interest in the
1778 oil that is produced. For instance, the farmer gets
one-eighth of the oil, and usually the operator gets
seven-eighths. The farmer's share is called "royalty interest", and the seven-eighths is called the "working interest". Frequently this is divided between several companies, and frequently the farmer sells undivided interests in his royalties, so that some division orders may have 25 to 30 names in them, showing the division of oil produced. The oil is paid for direct under the division order, and the money does not pass through the hands of the operating oil company.

The division order has a provision obligating the purchaser to take from the producer all the allowable oil on the lease which the division order covers. He has to take it as it is produced. He takes it from the tank. While they are filling one tank, they are usually emptying another into the pipe line. The purchaser pays the posted price. Each purchaser posts a price at which it buys oil, and the oil is paid for under the division order at the posted price on the day that the oil is run from the tank.

The small independent producer is not usually also a refiner. When a producer does not operate a refinery, he must sell his crude oil from day to day as it is produced, unless he has storage facilities. He can't close down his well when the price of crude oil goes down, or when 1779 he has not sufficient storage facilities, because if he did so, he would lose a part of his market to other operators in the pool. There is always somebody in a pool, some owner, some operator, that wants to produce his wells to the limit, and he will continue to produce. Then if he continues to produce, every owner or operator in the same pool must produce, or lose at least a portion of the oil from under his property. Also, if he fails to produce and protect the property from drainage, his lease is subject to cancellation.

The small independent producer does not build storage facilities to store the oil until he can find a purchaser, because the building of storage is usually for an immediate emergency; and in the ordinary course of business of the small producer that storage would be used but one time, and would be a loss involving a considerable investment. Usually the small producer is not able to make that kind of an investment, where these 80,000 barrel tanks cost about $20,000 to $25,000 apiece, depending upon the price of steel at the time.

An emergency would be either when the price had fallen abnormally low, or when every producer in the field was violating the orders of regulatory authorities and producing hot oil, or oil in excess of the allowable as determined by the state law under the authorities. In that emergency the producer, if he does not protect himself, loses his 1780 oil.

When the price of crude oil goes down below recovery cost, the producer has to keep on producing. It takes more barrels at a low price than it does at a fair or higher price to pay his operating costs and the interest on the money he probably has borrowed, so he is almost compelled to produce a greater number of barrels when the price is low than he otherwise would.

Q. Well, when that happens, in your experience do some of those producers begin to violate the proration laws?

Mr. Crawford: I object to that as incompetent, irrelevant and immaterial.

Mr. Donovan: I am asking if he knows.

Mr. Crawford: I object to it.

The Court: Objection sustained. Exception allowed.

The producers hurt themselves by the fact that they produce a greater quantity of crude oil in the sense that I have just related. It only aggravates their troubles, because the increasing amount of oil there is in the market makes the price go still lower. That period that I refer to was in 1933, for several years.

The larger companies have storage facilities for crude oil which are adequate to deal with their problems of storage. They own these trunk pipe lines; they own the
1781 pump stations, and they have adequate storage facilities adjacent to the oil fields at the pump stations along the trunk lines, where the oil is gathered into the pump stations. In times past, when there was an overproduction of oil, they filled up those tanks with the oil at a low price. This storage, some of it built years ago, is still in existence, and is there to be used whenever they need it. They use it over and over again, while the producer might not use it but once if he built it.

There are two general types of refining: the skimming plant and the cracking plant. The skimming plant operation is merely a straight distillation process. The oil is run into tanks or boilers, where it is heated; and the vapors arising from the oil, very similar to the steam arising from boiling water, are caught and run through condensing tubes. Usually there is cold water sprinkling over the condensing tubes, and when that vapor passes through the condensing tubes it is condensed back into liquid. The first vapors that come off are gasoline, then naphthas, and then next below that are kerosenes, the gas oil, and lastly there is a residuum that can be made into asphalts or road oils or left as fuel oil. That is the straight skimming plant operation.

The other method, known as the cracking plant, consists in heating the oil in receptacles or tanks that are able to withstand enormous pressures and high temperatures.
[illegible]82 They take the heavy, base oil for this cracking operation, after it has been skimmed and when there is no more gasoline in it that could be obtained by simple distillation. The high temperature and high pressure has the effect of cracking up the molecules of oil in such a manner, that when they are cracked and reformed, they go back together and form a certain percentage of gasoline. By

that method they have been enabled to get a very largely increased yield of gasoline out of what was formerly burnt as fuel oil.

I can't explain why these molecules act in this manner, I can't go into the chemistry of it. I know generally what the effect of it is, but as to why they do it and all that, I am not an expert in that line, and I can't explain it.

The cracking plant is more efficient than the skimming plant and is used when oil is of a sufficiently high price to amount to anything.

Back in the days when we had 10¢ oil, the skimming plant operation was just about as efficient on 10¢ oil as any other plant, because it was a waste anyhow. The skimming plant operations increase very materially when oil gets cheap. As oil becomes of a higher price, more of it is cracked and a greater percentage of gasoline is obtained from it. It is very much more efficient, from that standpoint. It is more costly to obtain gasoline by cracking than by skimming.

The cracking plants are very expensive to construct.
1783 It takes a big investment to put in cracking units.

There are hundreds of products that are made from crude oil. The most regular ones that are made in commerce are gasoline, kerosene, gas oil, Diesel engine oil, lubricating oils of the various grades and for various uses, asphalts, paraffin wax, the fuel oil that is used for the purpose of generating heat, and domestic burning oil that is used for heating homes. Then, in the more complete refineries, they make chemicals and dyes and various other things. There are hundreds of household articles, and just a myriad of products that are made from crude oil.

After the gasoline is manufactured by the refiner, as a general rule, in normal times, he puts it on the market. Each refining plant has a normal amount of storage facilities to maintain inventories necessary for working stocks. But it is the general rule among the so-called independent refiners not to have tankage for working stocks beyond a reasonable limit, and they do not usually have storage facilities beyond their necessary working stocks to take care of current business.

In times of overproduction, they are compelled to throw their product on the market at whatever price it will bring. That gasoline is called distress gasoline in the trade.

An independent refiner doesn't build sufficient stor-
1784 age tanks for his gasoline for several reasons. For
one thing, it is very costly; and for another, when he puts it in storage he is gambling on the markets, more or less, as to whether it is going to go lower or higher. Most

of them are not able to take those chances, beyond a certain limited amount of storage. It also ties up his capital, and he doesn't get any returns to pay for his runs of crude oil, and he has got to pay the producer for them every month. If he hasn't sufficient storage facilities, he sells the gasoline he produces from day to day at whatever price it will bring on the market.

When the price of refined products goes down below the cost of operating, the small, independent refiner can't close down his plant until prices rise, unless he expects to go out of business permanently, because of a variety of reasons. The most important is that he would lose his crude oil connections in the field. If he once cuts loose from the producer, the producer has to seek some other market or outlet for his daily runs of crude oil. And if he shuts down, he will also lose his marketing outlets for his refined products, as some other refiner will immediately take over that business.

As a general rule the independent refiner had certain customers that took from him pretty steadily. I know we did. We had other brokers and jobbers that bought from us from time to time. If we had shut down, those that 1785 were our steady customers would necessarily have had to go some place else to buy their gasoline and make other alignments and contracts with other people.

Of course, the independent refiners sell a certain amount on the daily market, whatever that is, the spot market.

It is a characteristic of the refining business that it is necessary for the average independent refiner to keep his refinery operating, regardless of the price of crude oil or the price which he obtains for his refined products. He has to keep it running continuously, or go out of business permanently. He has no choice in the matter.

I had an experience such as that from 1916 to 1935. My company was in receivership in 1933, but I maintained close contact with its operations every month because I was very heavily interested in it, owning 74% of the stock of the corporation. The refinery was shut down in March, 1935, because it couldn't recover from a barrel of crude oil enough products in value to pay for the crude.

By the Court

It wasn't the refinery that put us into the receivership. The Oklahoma City field was being developed at a very alarming rate, and the wells averaged $150,000 apiece. We had a pretty big acreage there to protect from the drainage of off-set wells. The company had to borrow a consider-

able sum of money and it bought a considerable amount of its oil field supplies from the supply companies on credit terms. We got big oil wells every time we drilled,
1786 but the Oklahoma proration finally got us down to only about one-half of 1% of our production. It was producing conditions back there in 1931 to 1935 that put us in the hands of the receivers and not the refinery, because we couldn't meet those bills. That was due to the producing conditions and the low price of oil. That is the reason we went into receivership. The refinery continued to run after the receivership until 1935, when it was shut down for the reason I have stated.

Mr. Donovan: Q. Mr. Franklin, why didn't the refinery close down in the late fall of 1934 when there was so much money?

Mr. Lewin: That is objected to as totally irrelevant.

The Court: He may answer that.

A. Because at that time there was a plan under consideration by the Petroleum Administrator to bring about a rise in the gasoline tank car price sufficient to return to the refiners the cost of their crude oil plus the cost of refining and enable them to keep going.

Mr. Crawford: We ask to have that answer stricken out.

The Court: It may be stricken out.

Mr. Donovan: May I except to that because it
1787 seems to me that is a proper answer to the question, and it shows exactly the circumstances.

The Court: Exception allowed.

By the Court

This refinery was in operation continuously from March, 1916 to March, 1935. The company's trouble in 1933 was caused by production trouble. That was what put us in the hands of the receiver. We weren't able to meet our current bills and went into receivership, and one of the officers of the company was appointed receiver. My right-hand man and vice-president continued to operate the company very much the same after the receivership as before.

Our refinery is not running now. It was closed by order of the court on March 4, 1935. There were some runs made through the refinery after that to clean up stocks of crude oil on hand. We were able to operate at a profit during 1933, 1934 and 1935 only at times. For short periods we would be able to operate at a profit, but generally we

couldn't operate at a profit from 1933 to 1935, because the price of crude oil had been maintained at $1.00 a barrel all through that period, and we couldn't recover enough from the refined products to get back the cost of crude oil and our refining costs and the transportation of crude oil so as to break even most of the time. Some months we would make a very slight profit, but most of the time we were in the red from $5,000 to $20,000 a month on the refinery.
1788 It was not costing us more to produce it than these others. That was the general condition of the independent refiner during that whole period, 1933, 1934, and part of 1935. In the early part of 1935, there was just about the same condition as there had been in 1933 and 1934.

By Mr. Donovan

Our company was using part of its own crude. The percentage varied. We used our own crude that was easily accessible to our own gathering system, and then we would sell the crude that we produced that was not accessible, because it would cost so much to extend the pipe lines and gathering facilities, and would buy crude of like kind where our lines reached. We had enough production at that time for our refinery, but it wasn't accessible to our pipe line.

By the Court

We were making some money on the production end. We were more than breaking even on that. One corporation owned the production end and the refining end.

By Mr. Donovan

Our production had been cut down by proration laws very materially. In the Oklahoma City field, we were running less than 1% of our production, which made it very difficult to get along from the production standpoint. We were making kind of a production, but we hadn't been able to pay back the money for the drilling of these wells at $150,000 each.

1789 *By the Court*

If we could have produced and sold 10% of our oil at reduced prices, say below $1.00 a barrel, we could have got along in fine shape. The price would have gone down below $1.00. But we had this oil reserve underground which we were not permitted to produce at that time in larger quantities.

It wasn't very much over-expansion that caused our financial troubles. You see, we were forced into drilling those necessary offset wells or losing our rights by forfeiture. We had to borrow money on the assumption that we could continue to produce 10% or 15% of our production. But in the meantime, after we had drilled these wells, the East Texas field was discovered, which wasn't in the picture at all when we borrowed the money. Until the East Texas field came in, we were running enough oil so I could have paid off these debts in the regular run of business without any difficulty. When the East Texas production was added it became necessary to curtail the Oklahoma City field from month to month until we got down to less than 1% of our production. Those were difficulties that nobody could foresee.

We had enough production in the company to run the refinery, but the fact remains that we bought most of our crude because our gathering system was out in the Healdton and Graham fields. We sold the crude oil that we produced ourselves and bought oil out of the other fields.
1790 The effect of it was an exchange, but it didn't make any difference at what we bought our product. The price was the same. I could have sold our oil for the basic price of $1.00 a barrel whether the refinery was running or not.

The Court: Wasn't he expecting the refinery end to carry the load of his production?

The Witness: No, the production was carrying the load for the refinery during that period.

The Court: The whole trouble with this kind of testimony is that there are so many variations that may enter into it, which may explain the downfall of one industry and not another; and after all, what I want to get before the jury is the picture of the entire industry at this time.

The Witness: Our refinery record, your Honor, is kept separate from the production, just as much as if it were two separate companies, or two separate businesses.

The Court: Let me ask this question:

Q. If you had started out in 1933 with your refinery out of debt, with your business out of debt, would you have been able to weather the storm?

A. Not for any great length of time. And I will
1791 say this, your Honor: That the major, integrated companies, if the conditions had remained the same as they were in 1933 and 1934, they would all have been closed by now.

Mr. Crawford: I ask that that statement of the witness be stricken.

The Court: That will be stricken. Exception allowed.

Well, we can get at the whole thing by finding out the cost of oil and finding the cost of refining a gallon of gasoline, just as well as we would by going into the reason for this man's going out of business. There may be some question of management involved there. Some men may be more fit to manage that business than other men. There are so many things that enter into the question as to why a man goes out of business, that I think we would be mixed up in a lot of collateral issues here. But I want this jury to know the condition that existed down there at that time.

They may know the price of petroleum and they may know what it costs to refine a barrel of petroleum.

Mr. Donovan: Then I would like to ask the witness, your Honor, in accordance with your sugges-
1792 tion, if you knew the conditions at that time among the independent refiners in your territory?

A. I did.

The price of crude oil in 1935 was $1.00 a barrel for 36 gravity Mid-Continent crude, and it had been at $1.00 a barrel since September 29, 1933.

I was generally familiar with the price which the average non-integrated independent refiner in the Mid-Continent field had to get for a gallon of gasoline in order to obtain cost recovery. I acquired that knowledge through the general studies made by the Planning and Coordination Committee and from my dealings as chairman of that Committee with the independent refiners during the Code period.

The Court: Q. Do you know what the cost was of refining crude oil that cost $1.00 up?

A. Yes sir.

Q. What was it?

Mr. Chaffetz: If your Honor please, that question relates not to what it costs to 85% of the manufacturers industry, but the question is what is the cost to the little non-integrated refiner.

The Court: There is some merit to that objection. Do you know what it costs the major companies to refine?

1793 A. No, I do not.

The Court: Then the objection is sustained. I want this jury to know what the petroleum oil was selling for, and what it cost to refine it, and I want them to know what it cost to refine not only the 15% but the 85%. If you are prepared to show that you may do so. If not, I want to end it.

Mr. Donovan: I am trying to do it step by step, your Honor.

By Mr. Donovan

My study showed that the average cost of recovery price, when paying $1.00 a barrel for 36 gravity Mid-Continent crude, was 5½¢ a gallon for the kind of gasoline that these independent refiners in the Mid-Continent made. By recovery cost, I mean taking into consideration all the costs involved in the transaction: First, the payment of $1.00 a barrel for the crude oil; the gathering charges in the oil field, where the oil was purchased; the transportation to the refinery; the processing or refining cost, and the overhead charges for the running and operation of the refinery. I am speaking about the kind of gasoline that the independent refiners of the Mid-Continent field made at that time without special treatment.

The small refiner doesn't need to give any special treatment to third grade, but he does to higher grades.
1794 The cost of refining is raised when he has to make the higher grades, and when he is compelled to use tetraethyl lead.

By the Court

All of these refiners down in that locality do not have the same kind and size of equipment.

The cost of transporting that oil from the well to the refinery varies somewhat in different localities, depending on the distance, but it usually costs about 5¢ a barrel to gather the oil in the field, and about 10¢ to 15¢ a barrel to transport it to the refinery. You see, they are not all the same. This figure that I have given is based upon the studies made, as a general average.

The 5½¢ per gallon recovery cost is made up of all these charges that I started to enumerate. There are 42 gallons of crude oil in a barrel, but the average recovery is about 44% gasoline, where they have some method of cracking. This 44% recovery would give them about 18½ gallons of gasoline in a barrel of crude oil. The general study has shown that the total cost of refining, outside of the cost of the crude oil, and these other charges that I have mentioned, will generally average somewhere from 43¢ to 45¢ a barrel.

The other products that the independent refiner gets from a barrel of crude oil, besides the gasoline, are a small percentage of kerosene, gas oil, domestic burner oil 1795 and fuel oil. As a general average, the Mid-Continent independent refiners could sell those other products for just about enough to equal the additional costs of refining and transportation, and so forth, over and above the cost of the crude oil itself, which left the gasoline to bear the burden of the cost of the $1.00 crude oil, which is about 5½¢ a gallon on an average.

Besides the gathering and transportation costs, there are refining costs. They will run from 20¢ to 25¢ a barrel in the different refineries. The total costs will average around 45¢ a barrel.

The average distance from the wells to the refinery varies. In some places the refineries are close to the production; in other places they are 25 to 50 miles away. Sometimes a part of the oil is gathered close by; sometimes a part of it is from a greater distance. These figures I have given were the general average that were shown by the studies made by the Planning and Coordination Committee and its sub-committees during the Code period, 1933, 1934, and the first part of 1935.

Dollar crude was in existence in 1935 as well as in 1933, and conditions so far as costs were concerned were about the same.

By Mr. Chaffetz

I don't see how the marked increase in consumption since 1934 could have any bearing on cost, unless, of course, the runs of the refiner involved were increased, and 1796 there was a greater volume run through the same refinery at approximately the same cost. Then the unit cost would be a little bit less. But experience showed that during this period, instead of running more through the refinery, the independent refiners were compelled to run less. That was true in 1935.

I was not ill all the time in 1935. I was ill at different times in 1935, including May.

Conditions in 1936 and the latter part of 1935 improved, the consumption increased, and some of the refiners were enabled to regain some of their markets and to run a greater volume of crude oil. To the extent that they did that, their unit cost, of course, was reduced slightly, but not enough to affect the general average situation.

I don't see the reasoning of saying that another factor that affects the costs of an independent refiner is the extent to which he has his own crude production, because if you have your own crude production, and your crude is worth $1.00 a barrel, and you can sell it for $1.00 a barrel, the cost of that crude is just the same, so far as the refiner is concerned, as to whether you produced it or bought it.

By the Court

In the flush fields, we made a considerable profit on the crude oil that we sold at $1.00 a barrel where we were allowed to run an appreciable amount of the oil. It is pretty hard to answer offhand as to how much we made. We were producing oil under all kinds of conditions and from different kinds of wells.

1797 At the Oklahoma City field, it was costing us, at that period, from our wells in what was known as the Lime area, about 50¢ a barrel to lift it with gas lift, and we were selling the oil at $1.00 a barrel and the difference there, between the lifting cost and the sale price was 50¢ a barrel. But that did not all represent profit, because entering into that was the amortization on the cost of drilling the wells, and the other development expenses. I can't give you that offhand.

Mr. Chaffetz: I move to strike out the testimony of the witness with respect to average cost.

The Court: I will withhold a ruling on that, until after you have completed your cross-examination on motion to strike.

By Mr. Donovan

The independent refiners attempted to cut the price of crude in October, 1934.

Q. And do you know why the independent refiners did not carry that threat into effect?

Mr. Crawford: We object to that as incompetent, irrelevant and immaterial.

Mr. Chaffetz: Certainly has no bearing on the issues in this case.

The Court: Objection sustained. Exception allowed.

1798 ***By the Court***

I am familiar with the refiners in that locality although I don't know them all personally. I suppose I know somewhere between 25% and 30% of the refiners. Most of that 25% have a little production, but not enough to run their refineries.

Mr. Francis: I don't think your Honor sustained that objection. You have no objection, I take it, your Honor, if this witness knows why the refiners didn't go ahead with their contemplated cut. If he knows why they didn't go ahead with it, then you have no objection to his answering it?

The Court: He may state whether or not the he knows.

The Witness: Yes, I do know.

The Court: All right.

Mr. Donovan: Q. What was the reason?

Mr. Crawford: Objected to as incompetent, irrelevant and immaterial.

The Court: Objection sustained. Exception allowed.

(In absence of jury):

Mr. Donovan: May it please your Honor, on behalf of the defendants I desire to make this offer of proof. If the witness, Wirt Franklin, were allowed 1799 to testify concerning the threatened cut in the price of crude oil in October, 1934, he would testify as follows:

That at meetings of the Planning and Coordination Committee of the Petroleum Code, commencing on Monday, October 8, 1934, there were discussions at which the members stated that a group of independent refiners in the Mid-Continent area were planning to cut the price they would pay for crude oil.

It was stated that these refiners had not gotten any relief in the tank car price of gasoline, which at that time was way below the price necessary for them to recover their costs; that these refiners had held a meeting in Kansas City that week or the week before, at which they had determined to cut the price of crude oil from $1.00 a barrel to 60¢ a barrel.

At the meetings of the Planning and Coordination Committee from October 8th to October 11th, the subject of this threatened cut was discussed.

At these meetings the members who were refiners argued that the time had come when it was necessary for the price of crude oil to be cut as they could no longer stand the loss which had been accumulating for months past and that they were compelled 1800 to sell their refined products at a loss of 40¢ a barrel due to the low price of refinery gasoline.

At these meetings the numerous price wars which were raging throughout the Mid-Western states, which were the principal markets of the independent refiners in the Mid-Continent area, were discussed; and it was stated that such price wars resulted from the enormous quantities of hot oil then being produced in the East Texas oil field which was being manufactured into gasoline, that this hot gasoline was being dumped on the markets in the Mid-Western states at tank prices as low as 2¢ below the usual quoted refinery prices.

The Planning and Coordination Committee took no formal action in the nature of a resolution in connection with this threatened cut in the price of crude oil. However, at a meeting of the Planning and Coordination Committee with the Petroleum Administrator, Mr. Ickes, on October 12, 1934, the threatened cut in the price of crude oil was brought to the attention of Mr. Ickes.

At this conference with Mr. Ickes, the witness recalls that C. B. Ames, Amos L. Beaty, Henry M. Dawes, C. F. Roeser, E. G. Seubert, John E. Shatford and probably other members of the Planning 1801 and Coordination Committee were present. Mr. Seubert and Mr. Dawes are defendants in this case.

After some discussion concerning other problems relating to the petroleum industry, the witness brought to the attention of Mr. Ickes the threatened cut in the price of crude oil in the Mid-Continent area. He arose at the meeting and stated in substance as follows:

"Mr. Administrator, in our discussions with you this morning, we have not yet brought before you what I consider to be the most important matter now pending. It is the threatened cut in the price of crude oil from $1.00 a barrel to 60¢ a barrel for 36 gravity crude. Mr. Secretary, there are two cancers gnawing at the vitals of the petroleum industry. One is the hot oil being produced in East Texas, which now amounts to nearly 200,000 barrels per day. The other is the recurring price wars which are increasing in number throughout the country, particularly in the Mid-Western states, which is the principal market of the Mid-Continent refiners. These refiners have, in a meeting in Kansas City—I understand more than thirty of them—determined on a cut in the price of crude oil to 60¢ a barrel, effective tomorrow morning. In our discussions of this question in the Committee this week, it has developed 1802 that if this price cut is made by the independent refiners, it will be followed by at least one major company, and if this major posts a 40¢ cut in the price of crude, it will be followed by all major purchasers immediately, with corresponding cuts in the price of crude throughout the United States.

"Mr. Secretary—" the witness continued—"if this cut takes place, the Oil Code is out the window. We can no longer pay the wages prescribed by the Code and employ the number of men that are employed under the Code with the shorter hours under the Code. No power on earth can require these producers to pay these men the wages prescribed under the Code if they cannot recover enough from the oil sold to pay the wages.

"Then again—" he said— "a cut of this character will not cure the evil. It will only bring about a condition where the same practices, the same hot oil, will be produced and the same price wars will continue but only on a lower level of prices, so that in ten days the same condition will exist as now exists and the same excuse for additional cuts will exist. If the price is cut, it will not stop until the crude price has reached a level of 10¢ a barrel. 1803 Now, this cut must not be made. I appeal to you to act on the resolution of the Planning and Coordination Committee which was sent over here last July for action and which has never been acted upon. I refer to the resolution to put in force minimum prices for crude oil and stop this price cutting. You have the authority to do it and no one else has."

After Mr. Franklin made that statement, Mr. Shatford arose. Mr. Shatford represented the independent refiners; and he contended for the price cut, pointing out the plight of the independent refiners and saying that they could no longer exist with the low price of tank car gasoline and pay $1.00 a barrel for legally produced crude; that they either had to cut the price or go out of business.

When Mr. Shatford concluded, Mr. Roeser, an independent producer from Texas, arose, and supported the position that Mr. Franklin had taken, demanding that the Secretary act upon the resolution fixing minimum prices.

The Administrator thereupon asked if anybody else had anything to say; and no other member of the committee responding, the Secretary said this: "Gentlemen, this price cut must not take place."
1804 He sent for one of his assistants and in the presence of all those there directed that assistant to get in touch with the refiners who were to meet at Chicago the next morning and ask them to postpone any action with reference to a cut in the price of crude until he could get there. The price cut did not take place.

At this conference, your Honor, the witness recalls that the Secretary of the Interior then called in a stenographer and dictated the following telegram to Mr. I. A. O'Shaughnessy, the president of the Globe Oil and Refining Company, who was one of the leaders of the independent refiners in the Mid-Continent area who were threatening to cut the price of crude oil, and who is one of the defendants in this case. And here is the telegram:

It is dated October 12, 1934, 12:56 P. M. It is sent as a Government message:

"NF 272 85 Government, Washinton, D. C.
12 122 P. M., Eastern Standard Time.

"I. A. O'Shaughnessy, President, Globe Oil and Refining Company,
59 East Van Buren Street,
Chicago.

"Have been advised possibility cut in crude price by independent refiners Stop As a result favorable action Department of Justice in
1805 sending fully authorized representative to East Texas with complete authority and with my division of investigation and other relief plans to strengthen refining prices I feel strongly optimistic for better conditions in refinery and

> marketing branch of the industry Stop I personally urge you make no reduction at this crucial time and thus hinder effectuation constructive plans Stop Horween will see you tomorrow morning.
>
> "Harold L. Ickes,
> *Administrator of Petroleum Code.*"

The witness will say that he knew the telegram was sent to Mr. I. A. O'Shaughnessy.

Now, in connection with this testimony, your Honor, the defendants would offer in evidence a copy of a telegram dated October 15, 1934, from I. A. O'Shaughnessy to Harold L. Ickes, duly authenticated by the Secretary of the Interior, and that telegram is this:

> "Retel October 12 my wire addressed to you September 6th outlined the position of the independent refiner quite clearly Stop Have discussed with Mr. Horween what to my mind would be the practical way to solve not only the independent refiners' position but the entire industry as well Stop This I am sure 1806 he has transmitted to you so there is no use of my going into further detail at this time Stop I might mention that Mr. Horween during the past few months has through personal contact with large numbers in all branches of the industry secured a very definite and concise picture of our various problems Stop If after hearing our message from him you still believe that it will not be workable we are willing to accede to your request and will not reduce the price of crude at this time Stop In all fairness to the independent refiner you will of course not ask us to remain in this position indefinitely Stop We believe that if anything constructive is to be accomplished in East Texas ten days or two weeks at the most should be sufficient time to determine whether or not your plans will get results Stop If at that time we feel that nothing can be accomplished to restore the tank car price of gasoline to a comparable basis of present crude prices we will of necessity be forced to reduce our price Stop In our case should your present plans fail 1807 it will mean an additional loss to us of at least

one hundred thousand dollars other companies' loss of course will be proportionate Stop I am sure you will agree with me that it is the inalienable right of all people to protect their position eventually and this of course we will endeavor to do Stop Our only prayer is that your plans will succeed so that we can all survive Stop Understand Mr. Boggs, President of the Kanotex Refining Company will be in Washington Wednesday to see you Stop He is quite familiar with the present deplorable position of the independent refiner and I am sure he can give you some very interesting data.

"I. A. O'Shaughnessy."

At that time, your Honor, it will appear that Mr. Horween was executive assistant to Mr. Ickes, the Petroleum Administrator.

And the witness will testify further, in connection with that, that as a member of the Planning and Coordination Committee and from his discussions as such member with the Oil Administrator, Mr. Ickes, and with the members of the Petroleum Administrative Board, that Mr. Ickes and the Petroleum Administrative Board wanted the price of 1808 crude oil to be maintained at at least $1.00 a barrel for 36—36.9 gravity Mid-Continent crude, and that it was the duty of the Petroleum Administrator and the Petroleum Administrative Board to accomplish the objectives and aims of the National Industrial Recovery Act, and particularly the Code of Fair Competition for the Petroleum Industry, and that the Petroleum Administrator and the members of the Petroleum Administrative Board recognized and admitted that these aims and objectives could be carried out only by the maintenance of a fair price for crude oil and refinery gasoline and that $1.00 per barrel for crude oil approached a fair price.

That, your Honor, is our offer of proof.

Mr. Crawford: We object to that offer, if the Court please, on the ground that the testimony, if offered and received, is incompetent and irrelevant and immaterial. And one might very well pause and inquire what has that got to do with the question of whether they entered into a conspiracy to rig the market, unless you get back to the question of whether it was unreasonable for them to expect to and to assist in arbitrarily raising the tank car spot market price of gasoline.

The Court: The defense will have an opportunity
to present any evidence in defense that this Court
1809 thinks is competent and relevant and material.
They should be permitted to show anything that
might affect the tank car price of gasoline during
1935 and 1936. The record shows that in September, 1933 to January, 1936 the price of crude oil
remained the same and thereafter there was a rise
in the price. Now, the offer of proof tends to show
that an offer was made at one time to reduce the
price of crude. That is back in 1934. In considering the offer of proof as to that particular offer, the
Government has objected to that for the reason
that it is incompetent, irrelevant and immaterial,
and that objection will be sustained. But that
doesn't indicate what I may do on other offers of
other testimony that may be offered later on. I
think that the defense should be permitted to show
anything that affected the price of gasoline during
1935 and 1936, the tank car price, and that they
have based their defense upon the Appalachian
Coals case and the principles laid down there, and
they ought to be permitted to offer evidence on
that, and make a defense on that theory; and the
Court will rule on every offer of evidence as it
comes. If they have prepared their defense upon
the law as laid down in the Appalachian Coals
case, and prove it, they have a perfect right to
do so.

1810 The offer of proof that they have made now, to which the Government has objected, that objection has been sustained. Exception allowed.

Mr. Donovan: May it be considered, your Honor, for the purpose of the record, that I make that offer of proof not only against the whole, but as to each particular element or part of the offer of proof.

The Court: Yes, that may be shown.

Mr. Francis: That will be deemed to be in question and answer form to which this witness answers here and to which they have objected to each question and answer, and it is denied.

~~The Court:~~ Yes. The offer was made on the theory that this witness would testify as to those facts. But any other defensive matter you have, you certainly have a right to ask those questions, and the Court will make its ruling at that time.

(The following proceedings were had in the presence and hearing of the jury:)

By Mr. Donovan

I was a member of the Planning and Coordination Committee in 1935, and during that year it was active in the administration of the Petroleum Code. During this period its work affected the refining process of gasoline in respect to the allocations that were made to the re-
1811 fining districts, the regional districts, and in turn the allocations of allowed throughput to the individual refineries. Throughput is the term generally applied to the crude oil that is processed in the refinery.

The work of the Committee also affected the refining process of gasoline materially in respect of the Code wages and the hours of labor which had been reduced under the Code and maintained. The cost of refining had been increased under the Code, as compared with the cost prior to the Code, because of the shorter hours and the higher wages.

The N.R.A. did not administer the Petroleum Code; it was taken out from under the general administration of the National Recovery Administration, and placed under the administration of Harold L. Ickes, the Secretary of the Interior. That was done because oil was a natural resource, and the Department of the Interior was the conservation authority of the Federal Government. Mr. Ickes was appointed Oil Administrator.

(Document received in evidence as EXHIBIT 825, and read to jury by Mr. Donovan.)

It is pretty hard for me to separate the duties of the Secretary of the Interior as to allocations from other activities all along the same line of administration. But speaking of allocations, the allocations were made by the
1812 Coordinator in conjunction with allocators in the districts approved by the Planning and Coordination Committee; and subsequently considered and approved by the Petroleum Administrator.

The Secretary set up two boards to assist him. He set up the board called the Petroleum Administrative Board, early in September, or about the middle of September, 1933. Nathan R. Margold, who was Solicitor of the Interior Department, was chairman; Charles Fahy, who was assistant solicitor, was vice-chairman; Norman L. Meyers was secretary; Dr. John W. Frey, E. B. Swanson and J. Howard Marshall were members. Elmer Thomas was the technical advisor, as I recall it, not a member of the Board.

(Document received in evidence as EXHIBIT 826, and read to jury by Mr. Donovan.)

The members of the Board were Government employees paid by the Government, and not connected with the oil industry at that time.

The Planning and Coordination Committe was appointed from the oil industry by the President, on recommendation of groups within the industry, and represented the oil industry in the administration of the Code. It was a Planning Committee to recommend matters having to do with carrying out the objectives of the Code, to make recommendations to the Petroleum Administrator, and to coordinate the activities of the oil industry to gain compliance with the provisions of the Code and the National Industrial
1813 Recovery Act. Also it was specifically provided for in the Code to try to get the coordination and cooperation of the regulatory authorities in the oil producing states in the administration of the Code, and in all matters in connection with it.

The Planning and Coordination Committee at first was composed of 15 members. All of them did not represent the industry; three of them represented the Government, without vote. The Government representatives were Donald R. Richberg, who was General Counsel of the National Recovery Administration; James A. Moffett and Mr. L. Benedum. Mr. Moffett was a vice-president of Standard Oil Company of New Jersey, I think, at the time he was appointed, or shortly prior thereto. I think he resigned from Standard of New Jersey. I don't remember the date of his resignation, but it was along about the time of his appointment, or shortly after that. Mr. Benedum was in the oil industry, and located at Pittsburgh, Pa. Mr. Moffett did not subsequently resign from the P. and C. Committee but was appointed by the President as Federal Housing Administrator.

The members of the original Planning and Coordination Committee, selected from the industry, were Charles F. Roeser, an independent producer from Texas, and at that time president of the Texas Oil & Gas Conservation Association; Howard Bennette, president of the Western Petroleum Refiners Association, an independent; Wirt Franklin, myself, independent producer; B. L. Majewski, of
1814 Deep Rock Oil Company, independent; E. B. Reeser, of Barnsdall Oil Company, independent producer and

refiner; Ralph T. Zook, of Bradford, Pennsylvania, an independent producer.

Barnsdall Company has been considered as an independent, and was so classified by the President when he made these appointments, dividing them between the majors and the independents. I consider it such.

I distinguish between an independent refiner and a major company by their actions, largely. Also, other factors are taken into consideration. The independent refiner usually does not have a fully integrated unit, although some of them, since the time they commenced business and were independent and non-integrated, have gradually acquired some production, and their own gathering systems and short pipe lines from their production to their refinery. However, even after they had done that, they continued to be sometimes independents, and sometimes they got over into the other class. The Barnsdall Company could be in the class of majors. It doesn't lack anything, or didn't lack anything of being in the class with the majors, but it was classified at that time as an independent in the appointment of Mr. Reeser to the Planning and Coordination Committee.

Those that were appointed to the Planning and Coordination Committee, representing the major companies, were: K. R. Kingsbury, president of Standard Oil Company of California; Amos L. Beaty, who had been a representative
1815 of the American Petroleum Institute in the Code hearings. He had previously been president of Texas Company. I think he was a director but not a vice-president of Phillips Company at that time. Henry M. Dawes, president of The Pure Oil Company; C. E. Arnott, at that time president of Socony-Vacuum; Axel J. Byles, president of the American Petroleum Institute; and W. T. Holliday, president of Standard Oil Company of Ohio.

Mr. C. E. Arnott is a defendant in this case, as are Mr. Henry M. Dawes, Mr. Reeser and Mr. B. L. Majewski, although I understand Mr. Majewski is not on trial at this time.

Under an Order of April 24, 1934, the Petroleum Administrator appointed 11 new members to the Planning and Coordination Committee. That brought the membership up to 26. The new members were: J. D. Collett, Fort Worth, Texas, independent producer, I. A. O'Shaughnessy, independent refiner, president of Globe Company, a defendant in this case, W. J. Reid, independent refiner from California, John E. Shatford, independent refiner from Arkansas, and M. K. Tillman, independent marketer and president of one of the marketing associations.

The representatives of the majors appointed were: C. B. Ames, who was chairman of the board of Texas Company, F. R. Coates, I think was vice-president of Cities Service, a defendant in this case, E. G. Seubert, president of
1816 Standard of Indiana, a defendant in this case, L. P.
St. Clair, president of Union Oil Co. of California, Walter C. Teagle, president of Standard Oil Co. of New Jersey, and A. E. Watts, vice-president of Consolidated Oil Corporation.

M. K. Tillman, appointed April 24, 1934 to the Planning and Coordination Committee, was succeeded two or three months later by William R. Schuh of the National Association of Petroleum Retailers. Mr. Schuh continued as a member of that Committee until the expiration of the Code.

I was just a member when the Planning and Coordination Committee was appointed. The officers were elected by the Committee itself. I was chosen as the first chairman on September 19, 1933, and I ceased to be chairman on March 15, 1934. I continued to be a member of the Committee until the end of the Code.

During the first six months of the Code I was in Washington practically all the time, and had my office in the office of the Planning and Coordination Committee.

That chart, Exhibit 827 for identification, shows accurately the organization of the industry under the Code of Fair Competition. It is a photostatic copy of a chart that was prepared by the Statistical Committee of the Planning and Coordination Committee to show the organization.

The Planning and Coordination Committee set up committees for the purpose of administering the Code.

1817 *By the Court*

This Committee functioned from September, 1933 to May or June, 1935. Its purpose was to cooperate with the Administrator as a planning and fair practice agency for the petroleum industry. From time to time it presented recommendations to the Administrator which would tend to effectuate the operation and provisions of the Code and the policy of the National Industrial Recovery Act. It also made estimates of petroleum requirements and such recommendations, allocations and inventories as were required for the effectuation of the Code.

The district allocators, I think, were appointed by the Coordinator, but with the advice of the Regional Refining Committee, and I think also it was with the approval, maybe not the formal approval, but with the approval of the Administrator. That is, a list of them went to the Administrator and if they were not satisfactory he would ask that they be replaced.

There was only one allocator in the district that had to do with the oil fields in Oklahoma. But the allocators worked in conjunction with the Refining Committee. A part of Texas was in the same district with Oklahoma. As I recall it, the Gulf coast was in a separate district.

I think there were 8 districts. In some of them the allocator was never appointed, but the work was handled
by another agency out of the Refining Committee. In
1818 the principal districts, however, allocators were ap-
pointed. Allocators were appointed for the district that took in Oklahoma and Texas.

Their duties were to allocate to the refineries in their districts the amount of oil which should be run to the refinery in any one month, so as to bring about a balance in the supply of gasoline manufactured with the estimated consumptive demand that had been made by the Federal Agency. They continued to so function until May or June, 1935.

By Mr. Donovan

Exhibit 828 for identification is a letter from Amos L. Beaty, chairman of the Planning and Coordination Committee, dated March 24, 1934, appointing an agency for the purpose of making refinery allocations. It is addressed to C. M. Boggs, Chairman, Regional District No. 4 of Arkansas City, Kansas. Letters similar to that were sent to those who designated the men as allocators in the various districts. I did not send such letters because these allocators were created after my term as chairman.

(Document referred to received in evidence as EXHIBIT 828, and read to jury by Mr. Donovan.)

There were production committees and refining committees appointed by the Planning and Coordination Committee. There was a committee known as the Production Committee, but that referred to crude oil production. There
were also the refineries' allocations committees and
1819 the allocators, which had to do with gasoline produc-
tion.

The agency that was appointed in the letter that was introduced a while ago had as its duty the allocation to the various refiners in that district of their individual quota of allowable refinery throughput from month to month after having received from the coordinator the amount that has been allocated to the district as a whole. It was their duty to divide it up equitably among the individual refiners in the district.

These refiners were not supposed to produce more gasoline than the amount allocated under the provisions of the Code, and if they obeyed the Code they didn't produce any more than that.

During the year 1935 the price of crude oil was $1.00 per barrel for 36 gravity Mid-Continent crude. The price of crude affects the price of gasoline very directly. It is the large part of the cost of the refined gasoline. The price of crude oil affected directly and substantially the price of gasoline in 1935.

During the period from February 1 until June 1, 1935, the price of crude oil was maintained at this figure of $1.00 per barrel.

One of the objectives of the Planning and Coordination Committee was to help the independent refiners.

Mr. Donovan: How did you propose to do that?

1820 Mr. Crawford: Objected to as incompetent, irrelevant and immaterial.

The Court: Objection sustained. Exception allowed.

(The jury then retired from the Courtroom. During the argument before the Court the following statements were made by counsel for defendants.)

Mr. Donovan: Your Honor, what I would like to do now is this: We have offered certain proof, certain evidence. We have offered that evidence upon the ground that your Honor laid down, the principles of the Appalachian case. We say that we are entitled to show, as proof of the correctness of our motives, that at the very same time that these objectives laid down by the Planning and Coordination Committee were the objectives to which we were conforming. That is the question. That is the question under the Sherman law. We are not coming in here and asking for immunity under the Code. We say that what we did required no immunity, because we were not violating the Code, nor were we violating the National Recovery Act.

Mr. Francis: Your Honor, the Refinery Amendment to the Code provided for certain kinds and types of pool buying in 1934—

In 1934, there were several buying programs, under that, which were written agreements, under which The Pure Oil Company would come in, and we would agree to take so many gallons at such and such a price, and that was helped by a pool, to be distributed out in an orderly way over the market at a period of time as might be stipulated.

1821 Now, your Honor asked us a specific question: Did we get an approval for these activities, under this particular provision? No, because we did not conduct any buying pool where there were commitments for definite amounts at specific prices. That is the answer to your question.

(The following proceedings were had before the Court in the presence and hearing of the jury:)

The Court: The Court will say this for the record: that the purpose of the N. R. A. was to stabilize all industry, including the oil industry which asked for such protection, such stabilization. And another purpose of the N. R. A. was to restore employment and better conditions of industry in this country. Now, that is as far as we ought to go. Exception allowed.

I may say that I don't think there is any dispute as to the fact that the price of crude oil was raised to $1.00 a barrel during the period of the N. R. A. and maintained at that price until January, 1936.

Mr. Donovan: At whose insistence was the price of crude maintained at $1.00?

The Witness: A. The Petroleum Administrator.

Q. And by the "Petroleum Administrator" do you mean Mr. Ickes?

A. I do.

1822 Q. Did the insistence of the Administrator upon the maintenance of the price of crude oil at $1.00 a barrel directly and substantially affect the price of gasoline during 1935?

Mr. Chaffetz: That is objected to as argument.

Mr. Lewin: Leading and improper.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: What effect, if any, did it have on the price of gasoline during the year 1935?

Mr. Chaffetz: That is objected to as immaterial and also objected to as a conclusion for the jury. The fact is crude was $1.00 and any man who made gasoline out of purchased crude paid $1.00.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. If it had not been maintained, do you know what would have happened to the price, as an oil man, with an experience of 25 years?

Mr. Lewin: Same objection.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. In your opinion, from your experience of over 25 years, would there have been a rise if it had not been maintained at that price?

Mr. Lewin: I object. Same grounds.

Mr. Donovan: Q. Rise in the price of gasoline which took place between March and June, 1935?

Mr. Lewin: Same question in a different form.

1823 Mr. Chaffetz: Depends on a lot of factors.

Mr. Donovan: Q. Would that have been one factor affecting the price of gasoline during that period?

Mr. Crawford: Same objection.

(Question read as follows:

> "Q. In your opinion, from your experience of over twenty-five years, would there have been a rise if it had not been maintained at that price, a rise in the price of gasoline, which took place between March and June, 1935?")

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Did you learn from your conversation with the Secretary of the Interior why he insisted on the maintenance of crude at $1.00?

Mr. Chaffetz: Objected to. Immaterial. Same question that was argued all day Monday.

The Court: Objection sustained. Exception allowed.

Crude oil reached the price of $1.00 a barrel in 1933 because an Order was made fixing the minimum price.

By the Court

That Order was made on October 16, 1933. Immediately after the effective date of the Code, when the price of oil was 74¢ a barrel, the Planning and Coordination Committee started the preparation of schedules of minimum prices based on the cost of recovery for submission to the Secretary of the Interior as the Petroleum Administrator, upon which he could fix a minimum price for both crude and the refined products. There were two very discordant

factions over that issue in the petroleum industry.
1824 The major companies with only two exceptions opposed it.

While that was under consideration by the Petroleum Administrator, the price was raised to 89¢ on about September 8, 1933 by members of the industry. Then the recommendation was sent over to the Petroleum Administrator on September 25, 1933 recommending fixing minimum prices of crude at 36 gravity at $1.11 a barrel. On September 29, 1933, the price was raised voluntarily by several of the major companies to $1.00 a barrel and met by all the others. On October 16, 1933, the Petroleum Administrator made the Order approving the recommendations of the Planning and Coordination Committee both as to crude and refined products to be made effective December 1st. I might say also that the Order provided for hearings for those who wanted to protest against the fixing of these prices. Those hearings were to be held between the middle and the 20th of November.

Those in the industry who opposed the fixing of a price by the Government, or even minimum prices based on cost, came into the Planning and Coordination Committee and also to the Administrator, and suggested a substitute plan which they said would accomplish the same result without the Government entering into the fixing of minimum prices. There was then an understanding reached between the Committee and the Petroleum Administrator and these other gentlemen who opposed the fixing of minimum
1825 prices to see if that plan could be worked out.

While those negotiations were under way to work out an alternate or substitute plan to accomplish the same purposes, the Petroleum Administrator extended the effective date of the price-fixing order to January 1, 1934. This other plan was worked out, and was in turn submitted to the Petroleum Administrator as a substitute. Later on, while that was pending, the effective date of the Order was again extended to February 1, 1934; and on January 31, 1934, it was revoked upon the determination of the Petroleum Administrator to approve the other plan and use it as a substitute to bring about the same results.

Mr. Lewin: Did the substitute plan ever go into effect?

Mr. Donovan: If it please the Court, can't I finish with this witness?

The Court: Let me find out.

By the Court

Before the Order was made cancelling the Order of October 16th, the Petroleum Administrator had approved the substitute plan. The substitute plan didn't fix the price. The price had been gotten to $1.00 and the program that was adopted and approved by the Petroleum Administrator was based on $1.00 crude and provided for certain things to be done to maintain the price of gasoline and petroleum products in normal relationship to $1.00 crude.

1826 January 19th was the date that the Petroleum Administrator approved the alternate arrangement, which was a Petroleum Agency Agreement, and approved it with modifications, changed some of the provisions of it, and January 31st was the date that the Petroleum Administrator revoked the Order fixing minimum prices. The changes or modifications which the Administrator required necessitated the Agency Agreement being signed and submitted all over again, as the Agreement was different, of course, from that which the members of the industry had signed.

On April 25, 1934, the Planning and Coordination Committee approved again the National Petroleum Agency Agreement, after it had been resigned and forwarded to the Petroleum Administrator for approval. My recollection is that after it got to the Administrator it was forwarded over to the Department of Justice and held over there for several months, neither approved nor disapproved. It was never approved again, but was just held there, and finally some of the signers withdrew their signatures, because it had been held so long, and then it couldn't become effective.

That is not the full part of the story as to how they arrived at the price of crude oil at $1.00.

Mr. Donovan: I want to ask him some questions relative to that, your Honor, if I may. But now, in view of your Honor's questions, I would like to have 1827 marked for identification the Order under Code of Fair Competition relative to minimum prices, referred to by the witness in answer to your Honor's question, of which I have a certified copy.

(Document produced by counsel is marked Exhibit 829 for identification.)

Mr. Donovan: And I offer that in evidence. (Submitting Exhibit 829 for identification to the Court.)

Mr. Chaffetz: We object to each and all of these documents, of course.

Mr. Donovan: I also would like to have marked for identification an Order dated January 31, 1934, signed by Harold L. Ickes, revoking the minimum price schedules attached to the Order of October 16, 1933.

(Document produced by counsel is marked Exhibit 830 for identification.)

Mr. Donovan: I offer in evidence also, Exhibit 830 for identification. (Submitting document to the Court.)

I would like also to have marked for identification Order dated January 19, 1934, signed by Harold L. Ickes, relative to the approval of the purchase agreement referred to by the witness.

(Document produced by counsel is marked Exhibit 831 for identification.)

Mr. Donovan: I offer in evidence also Exhibit 831 for identification. (Submitting exhibit to the Court.)

1828 And I ask that there be marked for identification letter dated December 8th, 1933, signed "Wirt Franklin, chairman of the Joint Committee representing the Planning and Coordination Committee and the group of major companies opposed to fixing the minimum prices," and addressed to Harold L. Ickes, together with its enclosure of two agreements, each dated December 7, 1933, all of which have the certification of the Secretary of the Interior. I ask that that be marked for identification.

(Document produced by counsel is marked Exhibit 832 for identification.)

Mr. Donovan: I offer in evidence also, your Honor, Exhibit 832 for identification. (Submitting exhibit to the Court.)

Mr. Chaffetz: If the Court please, I call attention to the fact that these documents are all dated in the latter part of 1933 or the early part of 1934, more than a year before the conspiracy started; and, even if they were effective orders, they could have no relation to the conditions that existed at the time the conspiracy charged by the Government commenced.

I point out the additional fact that none of these things ever took effect; they were all suggestions, set down for hearing, changes that were made, submitted by the P. and C. Committee to the Interior Department for approval, submitted to the Department of Justice, which never took effect. So that, if they weren't put into effect, even if they occurred during the time of the conspiracy, they wouldn't have any bearing on the case.

1829 Having all taken place more than a year before the conspiracy, I don't think much more has to be said as to their bearing on this case.

The Court: Objection sustained. The witness really testified to the material parts of these documents, anyway.

Mr. Donovan: I think not, your Honor; but, in view of your ruling, I hope that I may have the opportunity of renewing the presentation later of these documents; and may I take an exception now to your ruling?

The Court: Yes, you may.

Mr. Donovan: Q. Mr. Franklin, do you know what Mr. Ickes did relative to the rise in the price of crude oil in early September, 1933?

Mr. Lewin: I object.

Mr. Chaffetz: That is objected to.

Mr. Donovan: Your Honor, the witness has said that he has told only a part of that. I should think that we should have the whole.

Your Honor has permitted us to offer proof, now, that this price had been maintained at the insistence of the Administrator.

Now, I desire to show by this witness, if I may do so, just what occurred relative to the action by Mr. Ickes in having the price of crude oil established at $1.00. And I want to do that by showing what talks, if any, this witness, as Chairman of the Planning and Coordination Committee, had with Mr. Ickes.

1830 Mr. Chaffetz: The point we make, your Honor, is that this entire subject is irrelevant to this case, because we started our case on the assumption that the price of crude was $1.00.

The Court: The objection is sustained. Exception allowed.

Mr. Donovan: Then I only want to ask this question:

Q. Have you stated the entire story as you know it relative to the rise in the price of crude, and how the price of crude finally reached $1.00 and was established at that price?

Mr. Lewin: Objected to as irrelevant. It doesn't matter what he has stated, letting him characterize whether his story has been long or short wouldn't make any difference to the case.

The Court: Q. You have stated how the price was reached, haven't you?

A. Not the entire story, no, sir.

Mr. Chaffetz: We contend the entire story is irrelevant and immaterial and prejudicial.

Mr. Donovan: If a part of the story is relative, your Honor, I think all of it is.

The Court: He has answered the question fully enough to the satisfaction of the Court, and don't go into it any further. Exception allowed.

1831 Mr. Donovan: Well, your Honor, in view of that, may I be permitted to make an offer of proof on this?

The Court: Yes, you may.

(In absence of jury:)

Mr. Donovan: If the witness were allowed to testify, he would testify as follows:

The posted prices for crude oil, 36 gravity, in the Mid-Continent area on January 18, 1933, was 44¢ per barrel.

On May 6th the price was reduced to 25¢ per barrel.

On June 17th, the day after the National Industrial Recovery Act was passed, it rose to 44¢ per barrel.

On July 6th there was an increase in the crude price to 77 cents per barrel. This increase was initiated by Continental Oil Company and was followed later by other smaller companies.

On July 6, 1933, Carter Oil Company raised its posted price for this type of crude to 54¢ a barrel and such price was followed a day or two later by most of the major purchasing companies, and after several weeks the small companies which had posted a price of 77¢ a barrel reduced that price to the price posted by Carter Oil Company and others of 54¢ a barrel.

On August 25, 1933, 6 days after the Petroleum Code was signed by President Roosevelt, the price

1832 for this type of crude oil increased to 64¢ a barrel.

On September 6th it was increased to 74¢ a barrel.

On September 8th it was increased to 89¢ a barrel.

And on September 29, 1933, the posted price for this type of crude oil was increased to $1.00 a barrel, at which figure it remained all during the remainder of the year 1933, and all during 1934 and 1935.

The witness would say: I knew early in September, 1933, that Mr. Ickes, as Administrator of the Petroleum Code, was in favor of a rise in crude oil. I learned this from my discussions with him. During those discussions, as a member of the Planning and Coordinating Committee, I told him that in order to attain the objectives of the Code and to stabilize the petroleum industry, the price for 36 gravity Mid-Continent crude oil should be $1.11 a barrel, with corresponding price for other crude oils in the United States in relation to that price.

At one of these discussions, about September 6, 1935, the Secretary of the Interior told me that he was in accord with the view of the Planning and Coordination Committee that the price of crude oil should be raised to a point which would at least equal the average cost of production as a minimum price, and that price should at least be $1.00 a barrel.

1833 Just prior to one of these discussions with the Petroleum Administrator, Mr. Ickes, I had a discussion with Mr. C. E. Arnott in regard to the minimum price schedules for petroleum and its products, then under consideration by the Planning and Coordination Committee. During this discussion with Mr. Arnott, who was at that time a member of the Planning and Coordination Committee, I told him that the major oil companies should raise the price of crude oil.

Soon after this discussion I had a conference with Oil Administrator Ickes, at which I told him that if he would contact the executives of the major oil companies I believed that he would be able to get them to raise the prices they posted for crude oil in the Mid-Continent area.

The Secretary replied to me that he would take up the matter with the executives of major oil companies at the first opportunity that he had. A few days after this discussion, the Secretary of the Interior told me that he had discussed with executives of major oil companies the necessity of raising the price of crude oil in the Mid-Continent area. I do not recall what price the Secretary said he would ask them to post.

At a later discussion, probably early in October, 1933, I had another discussion with the Petroleum
1834 Administrator, Mr. Ickes, at which I told him that the Planning and Coordination Committee believed that the price of 36 gravity Mid-Continent crude oil should be increased to $1.11. I recall distinctly that the Secretary told me that he thought that since the price of crude oil was $1.00 a barrel, it should remain there for the present.

Mr. Ickes did not tell me how long he thought the price of crude oil should remain at $1.00 a barrel, but I do know from my later discussions with him from time to time that he did not want the price to go below $1.00 a barrel for 36 gravity Mid-Continent crude oil.

Mr. Crawford: We object, if the Court please, on the grounds already stated; and that the testimony, if offered, would be immaterial, irrelevant and incompetent.

Mr. Donovan: Your Honor, I assume we will have a ruling on each of these offers separately?

The Court: Yes.

Mr. Young: We are trying here, as best we can, to present to this Court a true picture of the economic situation in which this industry found itself in the spring of 1935. One outstanding fact—

The Court: Let me say to you right there, that you may do that, in 1935—

1835 Mr. Young: Yes. Now, if we may do that—

The Court: You may go back further than that. You may go back to the middle of 1934, and from there on, show it.

The objections of the Government to the offer of proof are sustained, but this witness will be permitted to testify as to conditions and factors in the oil industry in Oklahoma and in Texas that did exist in 1935 and 1936 which did not exist in prior years that may have caused a constant or practically unvaried price in 1935, of months of 1935, of the tank car price of gasoline. That is as far as I am going to let you go. Bring the jury in. Exception allowed.

(In presence of jury.).

Mr. Donovan: Q. Now, Mr. Franklin, do you know what the conditions generally in the country were at the time the Code went into effect?

Mr. Chaffetz: That is objected to as irrelevant and immaterial. The Code went into effect in September, 1933. Now, I don't see what bearing that can have on this case.

Mr. Donovan: It has this bearing, your Honor: We are offering this for the purpose of showing the history and background of the industry, and as furnishing a basis to explain what was done in 1935 and why it was done.

1836 And also, your Honor, this is most important: During the presentation of the case by the Prosecution they were permitted to show the prices as they existed between 1931 and 1936. We objected to that, unless it was shown that conditions were similar and comparable throughout all of that period. We desire now to offer this evidence also for the purpose of showing that conditions were dissimilar, and that those conditions in these various periods were factors as bearing upon the prices at those particular times.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, may I make an offer of proof on this?

The Court: Yes, you may.

(In absence of the jury.)

Mr. Donovan: May I have it appear, your Honor, that this will be offered, these several parts, as well as the whole, as if the question were asked and the answer made?

The Court: Yes, you may. The record may so show.

Mr. Donovan: This is an offer of proof of the conditions in the oil industry, at the beginning and prior to September 2, 1933, which was the effective date of the Petroleum Code.

1837 If allowed to testify, the witness would testify as follows:

As an independent oil producer and as president of the Independent Petroleum Association of America I knew of the conditions which existed in the oil industry for some months prior to September 2, 1933, the effective date of the Petroleum Code. As I saw these conditions for several years prior to the Petroleum Code the oil industry had been in a very demoralized state. This was brought about principally by the production of oil greatly in excess of consumptive demands.

The state regulatory authorities in the principal oil states in the Mid-Continent area, particularly in Texas, Kansas and Oklahoma, had attempted by proration laws to prevent this over-production and to balance supply and demand in accordance with the broad principles which the Federal Government had enunciated through the Federal Oil Conservation Board. However, the discovery of large flush fields, which were rapidly developed, and the inadequacy of state proration laws led to a flood of crude oil in excess of demand which the state authorities could not control. The failure of state authorities to get the cooperation of the small percentage of oil producers in these large flush fields who insisted upon producing, regardless of the state regulatory au-
1838 thorities, large quantities from their wells in excess of the allowables, caused other producers to necessarily produce in like manner. These conditions resulted in terrific waste of crude oil, the dissipation of gas pressure and the burning of billions of cubic feet of gas. This over-production and waste resulted in the posted prices for crude oil being reduced to as low as 18¢ in Oklahoma in the spring of 1933, and 10¢ in East Texas.

In Texas, crude oil was cheaper than drinking water. Since there was not adequate storage facilities for this crude oil, it had to be refined, with the result that there was thrown on the market large quantities of gasoline at half or less than the price which a refiner should obtain in order to recover his cost. This excess quantity of gasoline which all of the companies had at that time led to races for gallonage or outlets. The price wars which resulted from this great quantity of gasoline being dumped on the market led to further confusion and distress to all persons in the oil industry. Stripper wells had to close down; wages were reduced; inefficient equipment was used; and our oil resources were being rapidly depleted.

Mr. Crawford: We object, if the Court please, on the grounds already stated; and that the testimony, if offered, would be immaterial, irrelevant and incompetent.

1839 Mr. Donovan: Your Honor, I assume we will have a ruling on each of these offers separately?

The Court: Yes.

The Court: The objections of the Government to the offer of proof are sustained, but this witness will be permitted to testify as to conditions and factors in the oil industry in Oklahoma and in Texas that did exist in 1935 and 1936 which did not exist in prior years that may have caused a constant or practically unvaried price in 1935, of months of 1935, of the tank car price of gasoline. That is as far as I am going to let you go. Bring the jury in. Exception allowed.

(In presence of jury.)

Mr. Donovan: Q. Mr. Franklin, do you know whether Mr. Ickes knew the conditions, that the conditions in the oil industry were brought to the attention of Mr. Ickes in 1933, and whether or not he took any steps to relieve the situation of the industry?

Mr. Lewin: Objected to.

Mr. Chaffetz: I think that is the same question that was already asked, and it comes clearly within your Honor's ruling, and is prejudicial and should not have been asked.

1840 Mr. Donovan: It is part of our defense, your Honor. I hope it will be prejudicial to the government, because if we are entitled to show it—

Mr. Lewin: It is undoubtedly prejudicial.

Mr. Crawford: I think it is improper for counsel to ask questions when he knows the question is going to be prejudicial.

The Court: I think we will all assume Mr. Ickes had some knowledge of the conditions in the oil industry.

Mr. Donovan: Well, but I would like to show what particular knowledge he had and what he did in order to meet that condition.

The Court: The objection to that is sustained. Exception allowed.

Mr. Donovan: Then, your Honor, may I only say this: That I desire to make an offer of proof upon that.

The Court: You may.

Mr. Donovan: Now, your Honor, in order that I may not ask further questions of the witness relative to that, I assume your Honor's ruling would apply to all questions that I would ask concerning the Governors' Conference called by Secretary Ickes, at the instance of President Roosevelt in 1933.

The Court: Yes.

1841 Mr. Donovan: Is that correct?

The Court: Back in 1933 is a long way back of 1935. It is rather remote.

(In absence of jury.)

Mr. Donovan: Here is an offer of proof, as I say, of the Governors' Conference at Washington in March, 1933.

If allowed to testify, the witness would testify as follows:

The conditions in the oil industry which existed immediately prior to the Governors' Conference were brought to the attention of the Secretary of the Interior, Mr. Ickes, who later became the Administrator of the Petroleum Code, and also to the attention of other Government officials as a result of the discussions which took place and the recommendations which were made at the conference of the Governors of the oil-producing states, held in Washington on March 27-29, 1933.

That conference was called by the Secretary of the Interior at the request of President Roosevelt. It was the initial step taken to relieve the condition which had existed for some months in the petroleum industry.

The Governors of the various oil-producing states and representatives of the more prominent oil associations were invited to the conference which was 1842 held in the Department of the Interior building in Washington.

I was invited and attended the conference as one of the representatives of the Independent Petroleum Association of America.

The other persons who attended the conference were the Governors of most of the oil-producing states or their personal representatives.

Also there were present the representatives of the principal associations representing each branch of the petroleum industry.

One of the defendants in this case, whom I recall at present, and who attended, was Dan Moran, the president of the Continental Oil Company.

This conference was held for the purpose of determining the means necessary to remedy the demoralized condition of the oil industry, which then existed and which had existed for some time past.

At the opening date of the conference, Secretary Ickes personally made an address, which I heard. This address was published in the trade journals, in the newspapers, and was the subject of considerable comment among the members of the oil industry for some time.

At that conference the Secretary of the Interior made the following statement. It is this:

1843 "Gentlemen:

"This conference between the governors of the oil producing states or their representatives, and officials of the Department of the Interior, has been called for the purpose of determining, if possible, what can properly be done to bring about a greater degree of stabilization in the oil industry. The governors of the interested states were asked to attend personally or to delegate representatives. It was also suggested to responsible leaders of the industry representing the major companies as well as the independents that they be present in Washington on the occasion of this conference so that they might be available for consultation.

"You, gentlemen, are, of course, cognizant of the adverse conditions affecting the industry. Widespread tax evasion, the illegal production and irregular distribution of unmarketable production, the failure or inability to enforce existing state statutes—all have had a tendency to break down the legitimate conservation programs of the various states. Evasion of both the federal and state gasoline taxes has in itself unsettled the market for gasoline, the chief product of petroleum, the country over.

1844 "The public is concerned with the necessity for bringing production of crude into balance with the market demand for petroleum products. If this balance can be maintained, stabilization will follow, with protection to royalty owners, land owners, the consuming public, and manufacturing and marketing agencies.

"The present condition of the industry is due primarily to lack of observance of the oil conservation laws in effect in the larger oil producing states. Failure by a minority in the industry to cooperate for the betterment of conditions by refusing to purchase or transport oil illegally produced has also contributed serious problems. It is my understanding that the oil produced and run illegally over and above the official figures reported is variously estimated at from 100,000 to 300,000 barrels per day, which means that this amount of crude oil is being produced in excess of market or national requirements. This condition, coupled with the gradually decreasing demand for petroleum products, has served to aggravate the effect of excess production.

"It has been suggested that the Federal Government should cooperate with the oil produc-
1845 ing states to bring about uniform production not in excess of two million barrels of crude per day for the United States during the remainder of the present year, and that equitable allocation of this total be fixed definitely as between the various states and the individual pools therein. Acceptance of this production figure, I am advised, would approximately bring production and consumption into balance for the immediate future.

"Conditions affecting imports and exports would seem to require additional study at this time by the industry. There has recently been an increase in the importation of crude and refined oil in sharp contrast to the decline of imports registered when the excise tax was imposed.

"Every one knows that it is utter folly to produce oil unless there is a market for it, and that to produce largely in excess of consumption requirements is worse than folly. Every one knows, too, that oil produced in violation of the laws and regulations made pursuant thereto should not be run by pipe lines or received into pipe lines at any point, and further, that such unlawfully produced oil should not be purchased.

1846 Industry leaders should make every effort to assist enforcement agencies to the end that no individual or unit identified with the industry can evade or circumvent enforcement efforts.

"Destructive influences and clashing interests are bringing the oil industry, ranking among the great industries of the country, to its knees. The state and federal governments are receiving diminished returns in taxes; the land owner is receiving reduced royalties; owners and operators of 300,000 odd wells in the United States are operating under conditions which, if not corrected, ultimately will lead to the abandonment of these wells, for the price of crude oil paid to the producer is below cost of production in many areas. The refiner and marketer who evades taxation is, as the result of unfair competition, undermining the capital structure of the entire industry.

"What is needed most at this time is a display of sound sense and a readjustment of practices that will give to those engaged in the industry an opportunity for profitable operation of their business.

1847 "This conference is dealing with a great and most essential natural resource, limited in quantity by nature, which is dwindling from day to day because of unscientific management, with no present necessity for surplus production, as above-ground supply already is in excess of an economic stock level. Petroleum is being consumed at the rate of approximately 800,000,000 barrels per annum, and it must be remembered that this oil can not be either reproduced or indefinitely replenished. With the passing of time, this most valuable and necessary resource must inevitably reach a stage of practical exhaustion, at least so far as any practical use is concerned.

"In all human probability, the production of this limited supply of petroleum has reached or nearly reached its peak. Oil has been squandered for some years past and still is being squandered at a riotous rate by the reckless and improvident methods of capture and by ruthless dissipation of the energy of the natural gas dissolved in the oil in its natural state beneath the surface. We must not lose sight of the fact that the oil now being produced and likely to be produced in the future is essential to our national defense and general welfare.

1848 "During the past few years new oil fields of large producing capacity have deluged the market with so great a supply that petroleum has been forced into keen and violent competition with coal. The result is that probably one-half of America's oil production is being used to displace the equally effective use of coal, of which there is an almost inexhaustible supply. The waste of natural gas incident to the past and present methods of capturing oil at the surface is prodigal and extravagant. This waste is quite reliably estimated to be equivalent in value and effectiveness to a very large percentage of all the petroleum actually subjected to control and ownership.

"Rivalry in production from flush pools arises principally out of the fact that oil in the sands beneath the surface and the natural gas associated with it are migratory in character, and the general rule of law that there is no absolute title in either until capture and control at the surface. The incentive thus given to production has resulted in a promiscuous drilling of unnecessary, rival and wasteful wells, a sheer waste of a very large part of the associated gas,
1849 greatly lessening the amount of oil that can be ultimately recovered by flowing and pumping; and the waste of large quantities of the oil itself because of inability either properly to store or quickly market it.

"The supply of the future is and must be limited to resources yet undiscovered, because the reserve outside of the fields now being exhaustively drawn upon is comparatively negligible when we measure time by the yardstick of a few years.

"The rapid exploitation and depletion of new fields can not be controlled or even checked under existing conditions of private surface ownership with its resulting insensate rivalry in acquiring title to the oil at the surface, unless and until some competent superior authority assumes actual and positive control and exercises sane regulatory power, consonant with an intelligent public policy.

"If the country continues to produce and consume petroleum improvidently and extravagantly, as it has been doing without regard to the character or quantity of the resource or the uses to which it should be put, the result will be that at a comparatively early period we will find our oil resources so seriously curtailed as
1850 to affect adversely the standard of living of the American people.

"It has frequently been asserted that the Federal Government is without power to control or even regulate the production of petroleum from privately owned lands, except in case of drainage from Government lands. But it is by no means certain that the people of the United States are helpless to prevent the reckless dissipation of an indispensable natural resource. The states can, of course, under their reserved police power, respectively regulate and control the capture of petroleum within their respective territories to any extent which will prevent waste and loss of oil, and also natural gas, and in aid of such purpose can prevent owners of surface rights from drawing oil in a manner wasteful of the oil and gas beneath the surface of other owners.

"For two years proration of production in the major Mid-Continent fields has been in operation. State regulatory bodies and industry leaders have sought in vain for a balancing of supply and demand. During this period there has been an upbuilding of potentials, price has turned downward, production upward, and bootlegging of illicit oil has flourished. The whole
1851 price structure has collapsed. Out of this maze of confusion and conflicting interests must come a means of control or limitation of production that will assure a continuing, adequate domestic supply of oil that will not and must not exceed actual consumption requirements. Only by this means can the industry right itself.

"Fourteen billion dollars constitutes the capital investment of the petroleum industry. A million and a half of stock and bondholders and royalty owners have a common interest in the proper conduct. A million and a quarter presently employed workers keep this vast business alive—and themselves too. The first concern of the recognized leaders of an industry so essential to our industrial needs and our happiness and well-being as people should be the adoption of principles and practices that will with certainty prevent the unnecessary depletion of a limited natural resource, vital to the nation, in which 120,000,000 Americans have a vested interest.

"The solution of this problem is in your hands. And the problem, difficult and complex as it is, can be immediately solved if we all ap-1852 proach it unselfishly and patriotically. It ought to be an incentive to a determination to solve it to realize that its happy solution will be for the best interests of both the oil industry and the country."

The witness would further testify, your Honor, to this: I recall that the bad conditions existing in the oil industry were discussed very keenly and forcibly at the Governors' Oil Conference by a number of the delegates.

At the first session of the conference they divided into three groups: First, the representatives of the Governors; second, the representatives of the major oil companies, and third, the representatives of the independent groups in the petroleum industry. I was in the independent group. Each of these groups appointed a committee of five to make up what was known as the Committee of Fifteen. This Committee was to work out recommendations to remedy the existing conditions in the oil industry. I was selected on this Committee.

May I have this marked for identification, as part of this offer of proof, your Honor?

(Document referred to marked Exhibit 833 for identification. Said exhibit is in the words and figures following, to wit:)

1853

Washington, D. C.
March 29, 1933.

The Honorable
The Secretary of the Interior.

Dear Mr. Secretary:

The three committees respectively representing (1) The Governors of the oil producing States or their duly authorized delegates; (2) the oil and gas associations representing independent producers of oil and gas in the United States, and (3) the major oil and gas producing and importing companies, after conferring together, have unanimously agreed to recommend the following program to you, in order to meet the existing emergency in the oil and gas industry and to provide the basis for conservation and scientific future development of the oil and gas resources of our country:

A. To meet the existing emergency, the committees unanimously recommend:

1. That the President of the United States be requested to transmit this report to the Governors of California, Kansas, Oklahoma, Texas, and New Mexico, and to call upon them immediately to close all flush pools in their respective States until the 15th day of April next, excepting wells producing more than 10 per cent of water, which would be damaged irreparably by a complete shutdown.

1854 2. That the President of the United States be requested to call upon the Governors and legislatures of the principal oil producing states which have no adequate or no general conservancy statute to adopt such a statute immediately in order to further the conservation and scientific and more orderly development of the oil and gas resources of such States and in order to enable full cooperation toward those ends between all the principal producing States.

3. That the President of the United States be requested immediately to recommend to Congress the adoption of a law prohibiting the transportation in interstate and foreign commerce of any oil or the products thereof produced or manufactured in any State in violation of the laws thereof, and providing adequate penalties for violations of the said law.

4. That the President of the United States be requested (a) to require strict enforcement of the Federal gasoline tax and pipe line tax and vigorous prosecution of evaders

thereof, so long as the said taxes remain in effect, and (b) to instruct the Bureau of Internal Revenue to ascertain, at the time of collecting the tax, the consignor, consignee, destination and quantity being shipped by each refinery, and
(c) to instruct the said Bureau to transmit the said
1855 information to the tax collecting authorities of those
States into which the gasoline is to be moved.

5. That the President of the United States be requested fully to endorse the recommendations made herein and to appeal to the States, and to all those engaged in the oil and gas industry, faithfully to cooperate in the enforcement and observance of the said recommendations and in the limitation of production in harmony with a fair allocation of the national consumptive demand.

6. We further recommend that the President submit to Congress a request for emergency legislation authorizing him to appoint a personal representative to cooperate with the duly constituted authorities of the several oil producing States in bringing about a compliance on the part of said States with the program covered by these recommendations, and to advise and cooperate with the industry in complying with that portion of the program recommended for action by the industry, such Act of Congress to be effective during the emergency only, and whenever in the opinion of the President of the United States the emergency in the oil industry has passed, thereupon, by proclamation, the President may declare the emergency ended and the office, thereby created, abolished.

1856 B. To provide a basis for conservation of the oil and gas resources of the United States and the scientific future development of the oil and gas industry therein, the committees are unanimously of the opinion:

1. That the Government of the United States can aid and assist in the following respects:

(a) By initiating a comprehensive and scientific study of the entire subject and publishing, as soon as possible, a report of the facts found, conclusions reached and recommendations made with reference thereto.

(b) By imposing an adequate competitive tariff on crude petroleum and the products thereof.

(c) By eliminating the tax on domestic refined products and the Federal pipe line tax.

(d) By vigorous prosecution for evasion of the Federal gasoline tax and pipe line tax if such taxes are to be continued.

(e) By permitting drilling on the public lands to be delayed.

(f) By limiting imports to the average for the last six months of 1932.

(g) By continuing the Federal Oil Conservation Board as an advisory body.

2. That the producing States can aid and assist in the following respects:

1857 (a) By the enactment, where necessary, of adequate State laws under which conservation can be enforced.

(b) By the issuance of valid orders under such conservation statutes.

(c) By strict enforcement of the orders issued.

(d) By the equitable allocation of the allowed production as between pools.

(e) By limiting production of crude oil to the requirements of the consumer of refined products, or crude petroleum as such.

(f) By reaching an agreement with each other on the total market demand for crude petroleum and a proper allocation of this demand as between the producing States.

Note: Pending a more complete study of the subject, the production in the United States should for the time being be limited to 2,000,000 barrels per day, allocated as follows:

Texas	786,242	Barrels
Oklahoma	417,690	"
Kansas	93,366	"
California	432,432	"
All other states	270,270	"

(g) By rigidly enforcing the gasoline tax laws so as to prevent tax evasion, by preventing the diversion of the tax from highway uses, and by a reduction of the tax wherever at all possible.

1858 (h) By encouraging permissive unit operation under voluntary agreement.

3. That the industry can aid and assist in the following respects.

(a) By actively supporting governmental agencies in their efforts to make and enforce valid orders.

(b) By refraining from producing oil unlawfully and refusing to transport or purchase oil unlawfully produced.

(c) By marketing arrangements with limited areas conforming to the principle announced by the Supreme Court in the Appalachian Coals case.

(d) By diligent efforts to promote permissive unit operation under voluntary agreements.

(e) By avoiding excessive withdrawals from storage.

(f) By limiting drilling to the absolute minimum.

(g) By limiting imports to the average for the last six months of 1932.

C. If the foregoing conservation program is to succeed, the committees respectfully submit that it must be based on a price for crude oil which will allow a margin of profit to the producer and a price for the refined products which will allow a margin of profit for the refinery and the
1859 retail dealer.

Respectfully submitted
W. J. Brandred
W. N. Davis
Wirt Franklin
Chas. F. Roeser
C. B. Ames
R. C. Holmes

Committee of Fifteen representing Governors' Conference, and major and independent oil producers.

On Monday morning, March 27, 1933, before the organization of the said Committees and before the emergency measures recommended in subdivision A hereof were proposed, the representatives of oil and gas associations adopted, in meeting assembled, the principles and recommendations covered by subdivisions B and C hereof. The vote was as follows:

California Oil & Gas Association	Not voting.
Central Penna. District Oil & Gas Association	Yes.
East Texas Land Association	Yes.
East Texas Producers & Royalty Owners Association	Yes.
General Mid-Continent Oil & Gas Association	Yes.
Independent Petroleum Association of America	Yes.
Independent Petroleum Association of Arkansas	Yes.
1860 Independent Petroleum Association of California	Not present.
Independent Petroleum Association of Texas	No.

Mid-Continent Oil & Gas Association, Kansas-Oklahoma Division	Yes.
Mid-Continent Oil & Gas Association, Louisiana-Arkansas Division	Yes.
Mid-Continent Oil & Gas Association, Texas Division	Yes.
North Texas Oil & Gas Association	Yes.
Oil Producers Sales Agency of California	Yes.
Southeastern Ohio Oil & Gas Association	Yes.
Texas Oil & Gas Conservation Association	Yes.
West Central Texas Oil & Gas Association	Yes.
West Virginia Oil & Gas Association	Yes.
Middle District Producers Association (Penna.)	Yes.
American Petroleum Institute	Yes.

Mr. Donovan: The witness would say that he was present at the conference, and heard the discussions which took place with Secretary Ickes.

Further, your Honor, I would like to make an offer of proof of the conference on March 29, 1933, between Secretary Ickes and the Committee of Fifteen: If allowed to testify, the witness would testify as follows:

I was one of the Committee of Fifteen which met
with the Secretary of the Interior, in the Department
1861 of the Interior Building in Washington on March
29th, 1933. At that time, the Committee presented
to the Secretary the written recommendations which
it had unanimously adopted at the Governors' Oil
Conference.

I do not remember at that time whether the Secretary said anything specific with reference to higher prices for crude oil.

I do, however, recall a general discussion that there could not be conservation of our oil resources, pro-ration of production and limitation of imports into this country, without adequate prices for crude oil, sufficiently high to cover the cost of production in the stripper well areas of the United States.

I do remember that the Secretary of the Interior was in full accord with this idea; and that he agreed that it was necessary to preserve the stripper and pumper wells in the United States in order that oil resources under these wells be not lost.

The reasons why it was necessary to maintain stripper and pumper wells were brought to the attention of the Secretary at this conference. It was one of the main points of discussion.

1862 At the same time, some member of the Committee pointed out to the Secretary that it was necessary to maintain stripper and pumper wells because probably 225,000 people made their living from them; and that the families of these persons were dependent upon the continuation of the production of these wells; and the abandonment of them would force these people and their families on public charity, since these people had been operating these wells for a number of years, and had not been trained to do any other line of work.

I recall it was pointed out to the Secretary that other lines of industry were overcrowded, and that unemployment was general throughout the country; and that, in consequence, it was absolutely necessary that the strippev and pumper wells be maintained in existence; and that, in order to do this, the operators of these wells had to obtain a sufficient price for their crude oil to cover their costs.

And, furthermore, as part of the Governors' Conference, the conference between the Committee of Fifteen of which he was a member and the Secretary, he would testify to this:

I presented that part of the written recommendation of the Committee of Fifteen which relates to the 1863 importation of crude oil into the United States.

I recall that I told the Secretary of the Interior that, in the plan to stabilize the petroleum industry by the curtailment of production by state authorities in oil producing states to meet the consumptive demand, it was necessary to take into consideration the importation of petroleum and its products into the United States. I told him that there should be enacted by the Federal Government adequate tariff laws on import of crude oil and its products, so as to equalize the difference in the cost of production of Mid-Continent crude and the crude oil shipped to the Atlantic Seaboard from foreign countries.

At this conference, I told the Secretary of the Interior that Standard Oil Company of New Jersey and Shell Union Oil Company had both agreed to reduce their importations in accordance with the recommendation of the Committee of Fifteen; and that Mr. Walter C. Teagle of Standard Oil Company of New Jersey, and Mr. J. C. van Eyck of Shell Union Oil Company, had both publicly made statements to this effect to a representative of the Associated Press.

1864 The Secretary of the Interior said that he was in full accord with this program.

I submit that offer of proof, your Honor.

Mr. Crawford: We object, if the Court please, on the grounds already stated; and that the testimony, if offered, would be immaterial, irrelevant and incompetent.

Mr. Donovan: Your Honor, I assume we will have a ruling on each of these offers separately?

The Court: Yes.

The Court: The objections of the Government to the offer of proof are sustained, but this witness will be permitted to testify as to conditions and factors in the oil industry in Oklahoma and in Texas that did exist in 1935 and 1936 which did not exist in prior years that may have caused a constant or practically unvaried price in 1935, of months of 1935, of the tank car price of gasoline. That is as far as I am going to let you go. Bring the jury in. Exception allowed.

(In presence of jury.)

By Mr. Donovan

The limitation of imports had an effect upon the prices of gasoline in this country in 1933 and 1935.
1865 The limitation of imports helped to raise the price of gasoline.

(In absence of jury.)

Mr. Dorr: I have one supplemental offer of proof to make, possibly two.

You will remember that Colonel Donovan has offered to prove through this witness the conditions in the industry immediately preceding and in 1933. And that offer of proof tends to show the existence of hot oil, the existence of completely demoralized conditions in that industry at that time.

Now, we offer to prove further, from this same witness, that those conditions described in the offer of proof already made tended to produce and did produce numerous price fluctuations in that period; that is, these conditions which we have offered to show that he can prove; and that conditions in that period, as to such causes of fluctuations, are in no way comparable to the period from June 1, 1935 to December 22, 1936.

Now, in support of that offer of proof, let me say

this: In view of the evidence offered by the Government of the fluctuations in the earlier period, because
1866 they went into that; we didn't, in view of the evidence offered by the Government of the fluctuations in the earlier period, and their contrasting of those fluctuations with the leveling price in that period from June 1, 1935, to December 22; and the argument they have already made, that the leveling off of prices in the latter period in contrast with the earlier fluctuations is circumstantial evidence of the alleged agreed price during the period of June, 1935, to December 22, 1935, the refusal to permit them proof would not only be prejudicial to the defendants, but might be fatally prejudicial.

Supplementing and renewing the offer of proof heretofore made of evidence as to the importance of the conservation of crude supplies and of an adequate price of crude to permit the conservation of oil by permitting the operation of stripper wells, and supplementing and renewing the offer of proof heretofore made of the proposed cut in the price of crude in October, 1934, because of the lack of parity between the tank car price of gasoline and the price of dollar crude then prevailing, and of the efforts of Mr. Ickes, the Oil Administrator, to hold the price of crude at a dollar while efforts were being made to raise the tank car price of gasoline to parity with crude.

1867 We offer to prove, through this witness:

(1) That the tank car price of gasoline in the Mid-Continent area in January and February, 1935, was far below parity with dollar crude.

(2) That when the tank car price of gasoline is substantially below parity with the price of crude oil, the distress occasioned to refiners, and particularly independent refiners, tends to force down the price of crude so that reasonable parity may be restored and such refiners be able to operate at some profit, or at any rate at cost.

We further offer to prove,

(1) That the price of one dollar for Mid-Continent crude at 36-36.9 gravity was the lowest price for crude that was at all consistent with the conservation of our crude resources.

(2) That this was recognized by the governmental authorities of the state and nation charged

with the administration of laws dealing with conservation of our petroleum resources; and

(3) That measures tending to restore the tank car price of gasoline to a reasonable parity with dollar crude would have the effect of helping to relieve the pressure on the price of dollar crude that existed
1868 in January and February, 1935, and thus tend to aid in the conservation of our national resources and to effectuate the policy of the state and nation with regard thereto.

We further offer to prove that one of the causes of the subnormal tank car price of gasoline existing in January and February, and its lack of reasonable parity with the price of dollar crude, was the sale at distress prices of the gasoline necessarily produced by the independent refiners in the course of their operations over and above that for which they had normal outlets to jobbers and consumers. That is the offer of proof.

This evidence which we are offering is directed to the issue of whether or not, in view of the adverse effect on conservation of natural resources and the adverse effect on the established policy of the state and federal governments of maintaining a price of at least one dolla: for crude, the buying activities of the defendants in buying distress gasoline of the independent refiners at or near the low of the market instead of at lower distress prices, was a reasonable concerted effort, promotive of the public interests in the conservation of natural resources, and a reasonable attempt to remedy an abuse in the industry rather than an unlawful restraint of trade.

1869 Now, the question is, you have a situation, whether rightly or wrongly, where it was thought necessary that the price of crude should be established at a particular figure and maintained at a particular figure, and we want to show why that was. We want to show that any price below that would mean a waste through the shutting down of stripper wells and the marginal wells, and if that were done then there would be a permanent waste of a natural resource.

We want to show that the policy of the Government was to prevent that waste, and it was because of that in the very beginning of the Code the Government and the states had taken measures to try to keep that price at least at $1.00, possibly higher.

Now, here we are in a situation when this alleged conspiracy is supposed to have started. We did have that $1.00 crude. On the other hand, we had a price prevailing for the tank car market, the price for the gasoline that was refined from that crude that had to be bought at $1.00, which was out of line with that, so out of line with it that the independent refiners in the important sections of the industry, and refiners generally, could not buy crude at $1.00 and refine it and sell it at cost.

1870 Now, what was the natural effect of that? The natural effect of that was illustrated by the evidence we offered to show that in October certain of the independent refiners started to reduce that price from $1.00, started to cut that price down to 60¢ so as to bring it into line, bring the cost of raw material into line with what they had to sell the finished product at.

Now, that situation did not end in October. It continued, as we propose to show, in January and February. The price there was such as to continually threaten the price of crude.

Now, then, in that situation what are the causes of that lower price, lack of parity?

Now, we propose to show that one of those causes was the fact that these independent refiners had to keep running at a certain level, that certain of their markets had been lost by changes in freight rates, and so forth; but nevertheless, in order to keep their crude connections up, they had to keep producing about the same amount of gasoline. Now, that left a surplus over what would normally find its way into the hands of jobbers and consumer customers and the balance would be thrown on the market at a distress price, any price that a buyer who was holding off, and had the power to hold off, would ultimately buy at. 1871

Now, that tended to hold down the refinery price, by that abnormal competitive situation, destructive competitive situation.

Now, we say in determining whether the efforts, the activities, and that was one of the causes of the situation that tended to reduce the price of crude, which was against the public interest.

Now, we say that in determining whether that was a reasonable concerted activity to remedy an abuse in an industry which was lawful under the Appalachian Coal case, we say that in determining that we are entitled to show its effect, the effect of the removal of that abuse in relieving this pressure on the conservation policy, the adverse effect on the conservation policy.

Mr. Lewin: The Government objects to the offer of proof.

The Court: The objections of the Government to the offer of proof are sustained, but this witness will be permitted to testify as to conditions and factors in the oil industry in Oklahoma and in Texas that did exist in 1935 and 1936 which did not exist in prior years that may have caused a constant or practically unvaried price in 1935—of months of 1935, of 1872 the tank car price of gasoline. That is as far as I am going to let you go. Exception allowed.

You want to show what factors entered into that variation in price, back in those years, that did not exist in 1935 and 1936?

Mr. Dorr: Exactly.

The Court: All right, what are they, that you expect to prove?

Mr. Dorr: Two things. In the first place, the price of crude, before it was stabilized at $1.00, by the action of the Government, back in 1930 and 1931, 1932, and the early part of 1933, that there the actual price of crude, which the refiner was paying, was going up and down very rapidly because of changes in production and the introduction of new fields, and so forth; and that the state control, so far as it was attempted to be exercised, was not effective; and the lack of tariff, and so forth, and all of those conditions which tended to make that price go up and down; and it did go up and down, of course. It fluctuated wildly with every change in the effectiveness of the state proration laws or the amount of allowables under the proration laws, and those varied constantly.

1873 All of those things had a direct effect on the tank car refinery price because they affected the cost to the refiner of his major cost of operation.

Now, then, after you had your $1.00 price established for what you might call a legal crude, then you had a very considerable and constant variation in the effectiveness of the control over hot oil.

Now, for example: When the N. I. R. A. first went into effect in the summer of 1933, down there in these states where hot oil was being produced in violation of state laws very extensively, for a moment there was a thought, Well, now, the Federal Government is coming in,—that was a new element and it had an effect.

The Court: I don't think much of your theory about conservation. If the Government wanted to conserve this natural resource, they could have done so. I don't think that any group of men ought to assume that responsibility. I do think you ought to be permitted to show what factors entered into the price of gasoline that caused the variation during those years that did not exist in 1935 and 1936.

Mr. Dorr: Yes.

1874 The Court: We are not going into the history of the entire country conditions. I want you to stay right by the oil industry.

Mr. Francis: May it please the Court; before your Honor rules there are one or two matters that have been dealt with informally, and I want to see if the record properly reflects my understanding of what has been done.

First, it is understood by everybody, is it, that the records may reflect that the offer of proof by Colonel Donovan would have been that proof given as a result of questions and answers propounded to the witness. Colonel Donovan has summarized, for the sake of saving time, what Mr. Franklin would testify to in question and answer form.

The Court: That is my understanding.

Mr. Francis: That is my understanding.

Then, your Honor, it must be understood that we offer through this witness proof of changed conditions in 1935 and 1936 from conditions existing in years prior thereto, and that we propose to prove conditions different in the following respects which apply to either all or some of the years preceding 1935 as distinguished from the years 1935 and 1936, to wit:

1875 First: During a part of 1935 Section 9 (c) of the National Recovery Act was in effect, with Tender Boards thereunder, and such was not the case in prior years.

Second: During a part of the year 1935 there was in effect a Code of Fair Competition for the Petroleum Industry, and thereunder there was exerted certain administrative pressure, which was not the case in the years preceding 1935.

Third: On March 1, 1935, the Connally Act became effective, and Federal Tender Boards were set up thereunder, and this condition did not exist in the years prior thereto.

Fourth: Freight and pipe line rates were different in 1935 and 1936 from prior years.

Fifth: Tariff restrictions and limitations were different in 1935 and 1936 from years prior thereto, and in this connection the restrictions upon imports of foreign oils had been very much curtailed, commencing in the latter part of 1933, as distinguished from preceding years.

Sixth: In 1935 and 1936 scientific knowledge had been very much perfected as compared with preceding years in reference to the control of flush oil fields by proper utilization of underground pres-
1876 sures, such leading to more orderly production.

Seventh: In 1935 and 1936 there was a notable increase in consumption, whereas in the years prior thereto consumption had been declining along with a notable increase in production from prolific flush fields, such fields being unregulated in market demand statutes, as was true in 1935 and 1936.

Eighth: There was no state compact in existence in the years prior to 1935, and this state compact adopted in February, 1935 tended to stabilize prices both of crude and of gasoline.

Ninth: Refineries during the years 1935 and 1936 were worn out as a result of failure to improve and modernize same during the preceding depression years. This was a factor in keeping a stabilized market.

Tenth: Foreign demand for petroleum products materially increased in the summer and fall of 1935 and in 1936 as compared with the several years preceding 1935.

Your Honor will note that our offer of proof covers each of the above subjects, and I want it distinctly understood that if your Honor overrules this offer of proof there will be no question about the fact that we make a tender of each and all of the fore-
1877 going points to be brought out from the witness, Mr. Franklin.

It is our contention that these several things are different, some of them in all those years, and some in particular years that we want to prove as distinguishing 1935 and other years. Is that correct, Colonel Donovan?

Mr. Donovan: Yes.

Mr. Francis: Counsel understands that, and I do not want to have the record confused on account of the Court's ruling.

Mr. Lewin: The Government objects to that offer of proof.

The Court: The objections of the Government to the offer of proof are sustained, but this witness will be permitted to testify as to conditions and factors in the oil industry in Oklahoma and in Texas that did exist in 1935 and 1936 which did not exist in prior years that may have caused a constant or practically unvaried price in 1935, of months of 1935, of the tank car price of gasoline. That is as far as I am going to let you go. Bring the jury in. Exception allowed.

(In presence of jury):

The Court: In view of what I said before, that the Government has offered some testimony as to 1878 the variations in prices in these prior years, prior to 1935, the defense will be permitted to show the conditions and factors in the oil industry in Texas and Oklahoma that existed in 1935 and 1936 that did not exist in prior years that may have caused a constant or practically unvaried price in certain months in 1935 in the tank car price of gasoline. All right.

Mr. Donovan: Q. Mr. Franklin, you have heard the statement of the Court?

A. Yes.

Q. And I will ask you to discuss those factors affecting the price in 1935 as indicated by the Court that were not in operation in previous years.

The Court: Before you get to that I will ask Mr. Franklin this: Will you just give us without any argument or too much detail, just sketch for us the discovery and about the time of the discovery of the oil pools that affected the market, starting back in 1911, was it, that you—when was it that you discovered that pool?

The Healdton field, in southern Oklahoma, was discovered in 1913, and about that time the Cushing field in the northern part of the state was discovered. The two together created an excess supply of oil. In both fields there were

large, flush wells. The Healdton field had about be-
1879 tween 6,000 and 7,000 acres in its outlines, and the
Cushing field was probably 3,000 or 4,000 acres larger than that, with all of its extensions.

There were smaller pools, then, in the succeeding years. Almost every year there is some pool discovered of some consequence. The Hewitt field was discovered in about 1920 in Oklahoma, and it was a considerable field. Then smaller fields were discovered in the intervening years all over Oklahoma, but they were not of sufficient consequence to affect the market situation.

There was a series of fields discovered in Texas in 1921, 1922 and 1923, that affected the market temporarily, down in the area of Corsicana, the Mexia field and other fields there that were discovered along the Balcony Fault line, as it is called.

The next serious threat to the stability of the industry was a series of pools discovered in the Seminole area in Oklahoma, and at or about the same time, or maybe a little previous to the Yates field.

That was a very large field. The wells were shallow with a very large capacity, although the oil was rather heavy. The Seminole area and the Yates field in Texas, and also the Winckler and numerous other smaller fields were discovered along about that time. The Seminole area was developed and they were discovering new pools in that area
frequently and were adding to the area until there
1880 were some twenty pools there between 1926 and 1930.

In 1928, the Oklahoma City field was discovered, and while the area of that field probably wasn't over 10,000 acres, the size of the wells, that is, the capacity of the wells to produce a high grade oil, seriously affected the whole market situation in the United States, both in crude oil and refined products.

Oklahoma City had been going good from December, 1928, and was just beginning to be controlled by the Corporation Commission of Oklahoma under the regulatory statute when the East Texas field was discovered. Much of the land in that area being owned in small tracts brought into the industry a new group of oil producers that had never been in it before. They drilled wells very rapidly, spaced them close together, and produced a flush production, the like of which has never been known in the history of oil in the United States Up to the present time over 23,000 wells have been drilled in the East Texas field alone.

Because of the conditions, every time the immense production came on and was not controlled by the state au-

thorities, as they attempted to control it, all the barriers would break down, due to various causes, and hot oil in excess of the legal allowables would be produced. And whenever that happened, the price of crude would fall, and the price of gasoline would go down with it, and a
1881 very serious demoralization of the entire industry would occur. At one time in East Texas the prices were ten cents—

The Court: Q. I don't care about that. I just want to know about where the oil wells were. Now, proceed (addressing Mr. Donovan).

By Mr. Donovan

The first two or three months of 1935 were very similar to the years 1934 and 1933, in that there was no effective control of production to balance supply and demand. In January, 1935, that authority had broken down because of the Panama decision which invalidated the first Tender Board in the East Texas field. Immediately thereafter, the excessive production of hot oil produced over and above the allowables of the Railroad Commission of Texas brought a flood of oil which was refined and thrown on the market for whatever it would bring. That condition had existed off and on during 1933 and 1934, and in that respect was similar to those previous years, except that in this case the price of legally produced crude oil was maintained in 1935 at $1.00 a barrel for 36 gravity crude.

It had also been maintained during the year 1934, and from September 29, 1933, to the end of 1933. There had been no change in the price of crude from that time on, but there were violent fluctuations in 1933 in the price of crude oil before September 29th.

1882 The Tender Board with which the Panama case dealt was set up in October, 1934, and its authority ceased with the rendering of the Panama decision by the Supreme Court of the United States, holding it was a delegation of legislative authority and therefore void.

After that happened, the industry, the Petroleum Administrator, and the Planning and Coordination Committee all joined in asking Congress to pass remedial legislation, which was passed in a bill known as the Connally Bill in February, 1935, which prohibited the transportation in interstate commerce of oil produced in violation of the laws or lawful orders of regulatory authorities in the oil producing states. That oil that is so produced is commonly known as hot oil.

The authority to enforce that law was delegated by the

President to the Secretary of the Interior, and he immediately established another tender board known as Federal Tender Board No. 1 in the East Texas areas to control the movement in interstate commerce of this hot oil. That Board was established about the 1st of March, and the hot oil production was immediately decreased to a very great extent, but it was not entirely shut off until the Tender Board got under full way. In fact, hot oil never was entirely shut off, but it was finally reduced in the course of
30 to 60 days to approximately 5,000 barrels that was
1883 going out of the East Texas field.

Along about the same time, the Texas Railroad Commission, seeing the example set by the federal authority, and that things could actually be done, also made their restrictions a little tighter, and for the first time since the administration of the Code began, there actually was an approach to a balance of supply of production of oil with the demand.

Also, another factor that had a bearing in 1935 with previous years was that, with the recovery of the country from the depression, the consumption of products increased over the previous years. The consumption of gasoline and other petroleum products increased very materially in the spring and summer of 1935. There had been a decrease in the consumption during the period of the depression; the consumptive demand for petroleum products had dropped from 2,500,000 barrels of crude oil to about 2,000,000 barrels at one time. It got above 3,000,000 barrels in 1935. And during 1936 and 1937, it increased up to over 3,500,000 barrels.

For the first time since 1926, in fact, but especially during all the Code operations, the first time we really had a balance of production of supply with the consumptive demand was after the Connally law was passed and the Federal Tender Board was established and controlled this hot
oil to an extent sufficient, along with the increase in
1884 consumptive demand, to bring about a stabilized con-
dition of the oil industry in the late spring of 1935.

All during this period the imports of petroleum had been limited, by order of the Petroleum Administrator, to the average daily imports for the last six months of 1932. That, in terms of crude oil, was about 108,000 barrels a day of crude. That limitation was a necessary factor in the whole situation.

Also, there was a limitation of withdrawals of crude oil from storage, a complete prevention under the orders. Only upon a showing made by application to the Planning and Coordination Committee and proof of the necessity of withdrawal from storage was it legal under the operation of the Code, and then when allowed by the Planning and Coordination Committee, with the approval of the Secretary of the Interior.

By the Court

That prohibition of withdrawal from storage went all through the Code to the end in 1935. The same prohibition extended over other years. Imports were limited throughout the Code period, but they all had a bearing on the balance situation. Prior to the Code period, imports had been limited by an understanding with the Secretary of the Interior, commencing in the Governors' Oil Conference in March, 1933. Prior to 1933 there had not been any limitation on imports.

1885 Prior to that, in the Revenue Bill of 1932, Congress placed an excise tax on the importation of crude oil and gasoline, and that had an effect of slightly reducing the imports. But the limitation itself did not take place until that understanding with importers in the Governors' Oil Conference, and it was made an order of the Petroleum Administrator in October, 1933, which continued to the end of the Code.

By Mr. Donovan

That is the first time that that had been done that I know anything about.

The knowledge of the science and control of reservoir pressures has been increasing constantly; and knowledge of new and improved methods of preserving the gas energy and controlling underground water in the oil-producing formations has been added to and has continued to grow with the passing of each succeeding year, so that the knowledge in that respect and the ability to control those factors was greater in 1935 than it was in previous years. In 1935, as contrasted with 10 years previously, the improvement had been very marked; but it has been a very gradual development.

The interstate compacts dealt with the general conservation of oil and conservation methods in the production of oil; the coordination of the states activities to balance supply with demand; and all the factors having to do with
1886 the conservation of the oil states' petroleum resources, and their production in an orderly manner so as to bring about the greatest ultimate recovery of oil

through conservation practices and proper practices of production. Kansas, Oklahoma, Texas, New Mexico, Illinois and Colorado are in that compact.

While the compact itself has very little authority in its own right and of its own authority to control the production of oil, its method of operation has been to bring the different great oil-producing states together for the purpose of conference, so that each state may see all the other states' pictures. The effect of it has been an enlightenment on the part of the regulatory authorities of each state as to the whole national situation, and therefore a more willing attitude on the part of the different states to curtail their production and to let each state let the other state have what is considered its equitable share of the entire market without wasting oil by over-production. Its effect has been very marked in that regard, although without any authority itself to do anything or to issue any orders.

They have gotten practically all their information as to national demand from the Bureau of Mines of the Department of the Interior, from the figures on production and consumption of the Bureau of Mines. Once a month the
Bureau of Mines issues an estimate of the consump-
1887 tive demand for petroleum products for the succeed-
ing month, and reduces that to terms of crude oil supply, that is, the amount of crude oil that it would be necessary to produce to supply that consumptive demand, and the estimated amount that each state should produce as its fair share of that market.

These states do not always stay within that recommendation. Oklahoma and Kansas have stayed fairly well within it, in the orders of their regulatory authorities. Texas has stayed within it a part of the time, but frequently has gone over it a considerable amount in their orders, but on the average, Texas has attempted to stay within it, because it has later cut back to kind of make up the excess they had previously produced.

The general aim on the part of the regulatory authorities has been to follow and track closely the recommendations of the Department of the Interior or the Bureau of Mines in that Department.

There is no doubt but that this compact was one factor in stabilizing prices in 1935 and 1936, along with the stoppage of hot oil, the balancing of supply and demand, and the general stabilization influence that that had on the industry to bring things back to a normal situation.

There had not been any balancing of supply and demand in the years 1930, 1931, 1932, 1933, and 1934. Those first

years were years of violent fluctuation, due to alter-
1888 nate oversupply and cutting off of hot oil, and then
the flood coming on again and going off again. It was just up and down, in a violent manner. When I say "fluctuation," I mean fluctuation in the production of oil and the price of crude oil and also of gasoline and other products.

Beginning in 1935 there was an approximate balancing of consumption and supply. There was an adjustment in crude production to take care of the decreasing demand in the winter of 1935 and 1936. The allowable oil production fixed by the regulatory bodies and the estimates of the Bureau of Mines takes into consideration the declining consumption in the winter months, and the allowables are less in the winter months than they are in the summer months.

Prior to 1933 there had been a code of fair practices under the Federal Trade Commission. It was not a code similar to the N. I. R. A. Code, but it was a code of a sort. But there had never been any code such as has been described here under the administration of Mr. Ickes, or under the Department of the Interior.

General business conditions in 1935 were much improved over 1934, 1933, 1932 and 1931 and back to the commencement of the depression. We were coming out of the depression in 1935, and conditions were much improved in 1935 and 1936 over previous years. That tended to stabil-
ize all industry on a more profitable basis than had
1889 existed before that time. The effect was to increase
prices all along the line.

In the early part of 1935, the refinery allocations would have had some effect on the price. Also the buying of gasoline by the majors would have had some effect, depending upon its details, with which I am not familiar. But there had been buying also in previous years, although I do not know to what extent it had taken place, but I think that along with the other factors that would have had some effect.

While I was a member of the Planning and Coordination Committee, I heard of the Tank Car Stabilization Committee. I first heard of it at a meeting of the Planning and Coördination Committee in January, 1935. Mr. Arnott, who was a member of the Planning and Coordination Committee, was the one that told the whole Committee. He didn't just tell me. He told the Committee about it.

At that same time, Mr. Arnott was chairman of the

Marketing Sub-committee of the Planning and Coordination Committee.

Q. And of any other committee?

A. And had been appointed stabilizer in price wars, stabilizer generally.

Mr. Chaffetz: I move that be stricken out. That does not state the facts. It is a conclusion of the 1890 witness. He says he was a stabilizer generally.

The Court: I think that last part may be stricken out. Exception allowed.

The Tank Car Stabilization Committee functioned from January, 1935 on until the end of the Code. I know that as a member of the P. and C. Committee. If it did function after that time, I don't know it. The condition of the independent refiner was brought to the attention of the Planning and Coordination Committee at a meeting of the Committee during the session held from July 10 to 13th inclusive, 1934.

By Mr. Donovan

I know the Secretary of the Interior and have seen him sign his name; I am quite sure I can identify his signature. It is the signature of Harold L. Ickes on this letter dated December 11, 1934, under the heading of "Administrator for the Petroleum Industry, Interior Department Building, Washington," addressed to R. C. Cocanower, General Manager, Olney Oil and Refining Company, Wichita Falls, Texas. I don't know whether or not Olney Oil & Refining Company is a co-conspirator named in this indictment.

(Letter produced by counsel is marked Exhibit 834 for identification.)

Mr. Chaffetz: We object to it, Exhibit 834 for identification, on the ground that it is incompetent, 1891 irrelevant and immaterial, unless it is to be followed up by proof that the Secretary of the Interior approved the alleged buying program. In the absence of any such proof, we think any statements such as contained in that letter are immaterial to this case.

The Court: Let me ask you now, then, are you going to prove that there was such a buying program approved by Secretary Ickes as provided by statute?

Mr. Donovan: We are going to prove, your Honor, that there was no such buying program as is alleged in the indictment and therefore no such written approval was necessary.

The Court: That isn't what I have in mind at all.

Mr. Donovan: Well, I think that answers your Honor's question exactly, because, over what we did, we required no written approval. For what they allege there would be written approval required, and we say we did no such thing. I think it answers your Honor's question.

The Court: The Court will reserve its ruling on this until some later time.

(Later at R. p. 1062, the objection to Exhibit was sustained, and an exception allowed.)

1892 *Cross-Examination by Mr. Chaffetz.*

I testified to the Act of Congress approving the Interstate Oil Compact and I testified also that that Act of Congress was re-enacted. I think it was last June. I am familiar with that Act of Congress only to the extent that it approved the renewal of the Interstate Oil Compact.

Mr. Chaffetz: I ask the Court to take judicial notice of the Act of Congress, Chapter 572, Public Resolution No. 57, Interstate Oil Compact; and I read from Article 5 of that statute, which reads as follows:

> "It is not the purpose of this compact to authorize the States joining herein to limit the production of oil or gas for the purpose of stabilizing or fixing the price thereof or create or perpetuate monopoly or promote regimentation, but it is limited to the purpose of conserving oil and gas and preventing the avoidable waste thereof within reasonable limitations."

Redirect Examination by Mr. Donovan.

The enactment of the interstate compact law had the effect of assisting to balance production with consumption by enabling the authorities to get together and can-1893 vass the whole national picture, each to see the conditions existing in the other states, and thereby each to be willing to cut production in order to bring about balance between supply and demand. Up to the time of the interstate compact, there was a great contest between the different states over the national market, and one commission would allow more production than had been recommended, and then another state would retaliate by raising the ante, until in that way we would get too much oil; but when they all got together and looked at the whole picture, the tendency was for each of them to be reasonable and make concessions.

Recross Examination by Mr. Chaffetz.

I think the provision with reference to pure scientific conservation, and not stabilization, was in the compact. I was present at the meeting when Governor Allred of Texas insisted upon that provision being put in. It came from Texas, and not from Congress.

Redirect Examination by Mr. Donovan.

I said that the effect of this law was to aid in balancing supply and demand. I think that aiding the balancing of supply and demand does materially stabilize prices.

1894 Mr. Donovan: Q. Now, if supply exceeds demand, what is the result?

Mr. Lewin: Objected to. That is just laboring this same point. He already answered.

The Court: Objection sustained. Exception allowed.

Q. Mr. Franklin, do you recall a conference in October, 1933, between the P. and C. Committee and members of the Petroleum Administrative Board in regard to a crude purchasing plan in East Texas?

A. I do.

Q. Will you tell us the discussion that took place at the meeting concerning that plan?

Mr. Lewin: Objection.

The Court: Objection sustained. Exception allowed.

(In absence of jury.)

Mr. Donovan: If allowed to testify the witness would testify as follows:

I was present at a meeting of the Planning and Coordination Committee on October 11, 1933. I

was chairman of the P. and C. Committee at that time. Mr. Norman L. Meyers and Mr. John Howard Marshall, members of the Petroleum Administrative
1895 Board, attended the meeting of that Committee. They told the Committee that there existed several million barrels of crude oil in storage on the leases of independent oil producers in the East Texas field. They said that this was a menace to the stability of the oil industry since there was the temptation to move the oil at prices below the regular posted prices of crude oil. Mr. Marshall told us that he had recently returned from East Texas. He pointed out the plight of the independent producer and the need of the independent producer. He then suggested that it would be advisable to remove this menace of crude storage from the market. He suggested to the Committee that some of the major companies purchasing crude oil in East Texas buy up this stored oil at the posted price and hold it until sometime in the future when it might be drawn upon and liquidated in an orderly manner. Mr. Marshall also stated that the major oil companies who purchased in East Texas co-ordinate their efforts to clean up the entire amount. He said that the purchases should be in individual accounts of each purchaser and that the crude oil should be put into his individual storage. Mr. C. E. Arnott, a defendant in this case, and
1896 a member of the Planning and Coordination Committee, was present at that meeting. Before the meeting was over, it is my recollection that Mr. Arnott consented to the request made at the conference that he contact some of the major oil companies purchasing in East Texas and determine if they were willing to enter into a plan with other companies to clean up this crude oil storage.

About a week later, on October 17, 1933, there was a further meeting of the Planning and Coordination Committee in Washington. At that meeting Mr. Arnott was not present. Mr. J. Howard Marshall of the P. A. B. was present. By that time it had been determined that the major oil companies were willing to undertake the burden of purchasing this crude oil by the informal buying group at the posted price and hold this oil for a reasonable length of time. However, the members of this group wanted the assurance of the Planning and Coordi-

nation Committee that before initiating this purchasing plan that this crude oil would be the first crude withdrawn from storage, if the Planning and Coordination Committee, in accordance with Article III, Section 2, permitted net withdrawals of crude from storage. All of this was discussed at the meet-
1897 ing, in the presence of Mr. Marshall of the P. A. B.

At the meeting it was decided that assurance be given to the major oil companies in the purchasing group that the crude oil purchased under this plan be the first crude oil permitted to be withdrawn from storage. At the meeting it was decided to send a telegram, which was done, to Mr. C. E. Arnott, at New York, giving him this assurance. I saw the telegram before it was sent and know it was sent.

Now, I read that telegram, which is dated October 17, 1933, addressed to C. E. Arnott, Socony-Vacuum Corporation, 26 Broadway, New York:

> "Best we can do is assure purchasers of these small lots of East Texas oil in storage that if they will purchase same at currently posted prices of principal purchases we will approve orderly liquidation or use of this or corresponding quantity of crude after March 1st, in which event those resulting withdrawals from storage will be approved. Sellers will be required, before withdrawing from their storage, to obtain the approval of regional committee and our approval in each individual case. In this way abuses can be prevented."
>
> Signed "Planning and Coordination Committee."

1898 At the meeting, Mr. Marshall, who was extremely anxious that this plan get under way, suggested that he go to New York and see Mr. Arnott in connection with this matter. At this meeting, Mr. Marshall stated in substance: that this large volume of crude oil in the hands of independent producers was legally produced crude, some of it having been held in storage a long time; that their tanks were full, and it was necessary that they have relief; that they were financially unable to hold the oil much longer, and if some orderly process was not developed by which they could be relieved, it would inevitably happen that they would be compelled to dump this oil on the market at any price it would bring. He

stated the object of the Petroleum Administrative Board, in asking us to assist in this matter, was twofold: first, to help the independent producer in the emergency with which he was faced; and second, to prevent this oil from being surreptitiously withdrawn from storage and dumped at a price much less than the regular posted price for that grade of crude oil, having the same refined into gasoline, and the gasoline in turn dumped on the refined market, with the inevitable consequence of bringing the tank
1899 car price and the retail price of gasoline still further below parity with crude than existed at that time.

I know that Mr. Arnott later undertook to get some of the major oil companies to purchase this crude oil in the hands of independent producers in East Texas. I do not know the detailed steps that he took to carry out the plan except that I understood that he asked major companies to buy crude oil in the East Texas field at the posted prices and to keep on buying until the excess storage was cleaned up. I learned this information as chairman of the Planning and Coordination Committee because I was then keeping in close touch with all of the matters on which the Committee had acted. I know that some purchases did occur in East Texas, but to what extent, I do not know.

The Court: Let the record show that the objections of the Government are sustained, to the offer of proof. Exception allowed.

1900 JOHN E. SHATFORD, a witness for the defendants, testified as follows:

Direct Examination by Mr. Dohovan.

My residence is El Dorado, Arkansas. I am 48. After leaving school I was employed by various independent refiners until 1921. From 1921 to 1935 I operated Ouachita Refining Company at El Dorado.

I was in Washington in 1934 and 1935 as a member of the Planning and Coordination Committee under the Petroleum Code of Fair Competition. From April 24, 1934 until March 25, 1935, I was alternate National Coordinator, and from March 25 until the close of the Code I was National Coordinator. The National Coordinator chiefly administered what was known as the refinery section of the Code.

My duties had to do with the administration of the refinery allocations under the Code.

The terms "independent refiner" and "non-integrated refiner" are used interchangeably in describing the small refiner. A non-integrated refiner is one who is in the refining business primarily. Sometimes he owns a little production. Frequently he owns none. Sometimes he owns some filling stations, and bulk stations or jobbing stations. Usually he owns none.

An integrated company is one which engages in each of the several phases of the oil business. It engages in
production; that is, the drilling of wells and selling
1901 of crude oil; in transporting crude oil through pipe
lines from the fields to the refineries; in the refining of that crude oil and the making of many products; and in the distribution of the products through both bulk stations and service stations to the consumer. Some integrated companies are what we call balanced companies; that is, they produce about enough oil to refine and sell. Others buy some of their crude. Others don't own enough stations to take care of all their supply and have to sell some on the outside.

A non-integrated refiner might be said to be a dependent unit; that is, he must buy his crude oil at the market, and sell his product the best way he can. Whereas, an integrated refiner is somewhat self-sufficient; he has his own raw material and sells his own product.

In relation to the retail market, an integrated refiner is not located in approximately the same place as a non-integrated refiner. There is quite a fundamental difference in the location of the two.

When the oil business began to grow out of infancy into an industry of some size, somewhere from 1910 to 1915, the automobile began to become a factor. At that time, just before the growth, the few large refineries were located
at the market, but there were not very many of them.
1902 Ohio and Pennsylvania were the two states that
formed the cradle of this industry, but there weren't very many refineries in those days. Then came the automobile, and the extended and urgent search for crude oil. Then came these southwestern fields, in Oklahoma and Kansas principally at that time; Texas had not yet become a factor.

About that time, the automobile caused a greater demand for gasoline than the refiners could supply. The larger companies at that time didn't have refining capacity sufficient for the demand of gasoline. Consequently, plants began to be built in this southwestern field where this new production was occurring.

Under those conditions, these small refineries located in Kansas and Oklahoma had a very urgent demand for their gasoline. They could ship it clear up here into what is now known as the Mid-Western section. They were the largest marketing factors in that territory. They could also ship their gasoline over into Ohio and into Pennsylvania, even into southern New York.

The major companies began to catch up in their refining facilities with the demand for gasoline in about 1920. They had enlarged their refineries at the market. They began to build plants on the Gulf Coast because crude production had occurred in Texas in very large quantities.
1903 They had pipe lines running across to the Atlantic seaboard; and they used them to take oil from Kansas, Oklahoma and Texas and pipe it across the country and refine it on the Atlantic seaboard. They would export their product to Europe and supply all the concentrated market, in the East. But they found that that was pretty expensive. They found that they could lay their pipe lines to the Gulf coast and then take tankers and come around Florida to the Atlantic seaboard and supply those refineries very much cheaper than they could do it by pipe line. That resulted in a huge saving in the cost of transportation. It was a very substantial saving in cents per barrel and a somewhat substantial saving in at least fractions of a cent per gallon and enabled the refineries along the Atlantic seaboard to grow very rapidly.

They used this saving in transportation, not to put in their pockets in the form of profits, but to expand their markets. Because they were able to refine cheaply as a result of cheaper transportation costs, they were able to compete with gasoline moving to the East in tank cars, and to compete farther west from the Atlantic seaboard.

And so this Atlantic seaboard market began to cross the Appalachian Mountains. It encroached in western Pennsylvania, West Virginia and Ohio and drove the
1904 smaller refiner practically out of northern Ohio. So that as a result of that single factor, practically all of the market in these states was lost to the independent refiner.

The independent refiner was shipping his product from his field refineries in Kansas, Oklahoma and Texas, up into the Chicago market in tank cars. The same saving in transportation which resulted through this movement to the East, of course, always existed in the transportation of crude oil from Oklahoma to the neighborhood of Chicago. That is, you could take crude oil by pipe line from the southwestern fields into Chicago, and refine it there, and then distribute the products from there by tank cars on short hauls, very much cheaper than you could take the finished products from a refinery in a southwestern field and send it up to the Chicago area by railroad.

As the gasoline demand increased and these markets became more concentrated, the refineries at the market were built larger and larger, and more and more of what we call back hauling took place. That is, instead of having a market that was just a narrow circle around Chicago, for example, this market began to expand. As it expanded, of course, it drove the independent refiners back against their own refineries.

A little bit later came the Kentucky fields. The Kentucky refineries located there began to ship up into
1905 Ohio, western Indiana, Kentucky, and some into
West Virginia. So that market was finally lost to the Mid-Continent refiner, who could no longer ship into that territory advantageously.

Then came oil in Michigan and the Michigan refineries took Michigan away from the Mid-Continent refiners.

This went on from year to year, so that the Mid-Continent refiner, who used to command the Mid-Western market, and almost the Eastern markets, was finally driven back into a small area in Iowa, Missouri, Southern Illinois, Kansas, Nebraska, North and South Dakota. Even some of that territory isn't as advantageous as it was a few years ago.

Then we had a new development in the industry: the gasoline pipe line. All of these pipe lines I have talked about were crude oil pipe lines, carrying raw material to where it could be refined cheaper at the market. But a group of companies got together down in the southwest and built pipe lines into Illinois, Indiana, Missouri, and Minnesota that carried finished gasoline.

I think 7 companies, each of which would be regarded as a major, own the Great Lakes Pipe Line. The Phillips Petroleum Company has a pipe line. I think altogether those companies transport about 50,000 to 60,000 barrels of gasoline a day. It is a very substantial factor from the standpoint of market encroachment.

1906 These pipe lines are either owned or controlled by the major companies and are a part of the integrated organization of these companies. My point has been to describe the gradual shrinkage that has taken place in the market of the small refiner which fundamentally, more than any of this other business, has caused his situation to become a very difficult one from the standpoint of getting rid of his product.

The small or non-integrated refiner has three principal market outlets. The first one is very small. Some small refiners have gone into the distribution of gasoline directly from their plants by trucks. In the aggregate that is not an important factor. The second one is their direct market, or what might be said to be their own market. It is principally the shipment of gasoline in tank cars to independent jobbers. The third market of the independent refiner is the sale of gasoline in tank cars to major companies.

During the period that I described in which the major companies had not caught up with the demand for gasoline that grew from the extended use of automobiles, the major companies had to buy gasoline. So they bought from the small refiners, who were located in the Southwestern states. But a change took place in that situation
as a result of the technical advancement of the refin-
1907 ing industry. The major companies began to in-
crease their refining facilities, so they soon reached a point at which they could manufacture all of the gasoline that they needed for their own customers.

In addition to that, they had enough gasoline so that they had some to spare. The consequence was that they were compelled by competitive circumstances to cease buying from the small refiner. To make a bad matter worse, they not only ceased to buy from him, but, because they had more product than they could conveniently dispose of, they began to compete with the small refiner for the small refiner's own customers. In effect, as a generality, it might be said that that competition was the result primarily of the development of the facilities of an industry. The consequence was that the small refiner not only wasn't able to sell major companies that he used to, but he wasn't able in all cases to hold his own customers.

One of the competitive conditions that resulted from this surplus supply of gasoline in the hands of the major companies was a new form of contract which, as I remember it, came along about 1924 or 1925. If you were an oil jobber, the refining company would come to you and say, "Now, if you will buy my gasoline for one, two or three years, I will give you a contract that will provide a fixed margin for you, on which you can do business, so

much per gallon. If the market goes up, your margin is fixed. If the market goes down, your margin 1908
is still the same. So you can go ahead and do business, but use my product and no one's else."

This contract, of course, was one that no company wanted to give unless it had to give it. Rather than give these contracts too willingly, competitive conditions compelled these major companies to start buying up or buying out independent jobbers who had good distribution through their stations. So the majors began to buy up this market that the small refiners had and their competitors had.

The result was that they went as far as they could go with that sort of thing. But some jobbers didn't want to sell out. They insisted upon these contracts. They insisted that the small refiner who was selling them meet competition, and, of course, it was a very hazardous thing for the small refiner to guarantee for a long term of years that he would give his customer protection under all circumstances.

I have described the condition at the time the Code went into effect. That condition was quite prevalent at the time that the East Texas field came in. The discovery of the East Texas field, of course, created a very severe surplus of oil. The small refiner found himself in rather a serious predicament, because there was a market price for 1909 crude oil which was paid by the major purchasers of oil. This was called the posted market price. The small refiner, adjacent to any oil field, had to pay that price; he had no choice, except, generally speaking, those in the East Texas field were able to buy oil very much below the posted price. That was called excess oil or hot oil, oil that was produced in excess of allowables. The condition that existed there, that permitted those different prices for crude oil in that field, was the unsuccessful attempt to enforce proration laws. There may be an exception here and there, but that situation did not apply to refiners outside of the East Texas field.

Refiners in Louisiana and Arkansas, for example, weren't able to get very much hot oil. Nearly all of us got some of it, and we all tried to get all we could. But, generally speaking, we couldn't get very much, because of the fact that the rules and regulations passed by the Railroad Commission of Texas were being enforced and policed in such a way that a man who attempted to get that oil across state lines was harassed and threatened with prosecution. The average refiner didn't want to undertake that risk.

At the time of the adoption of the Code, or say, in 1933, all the conditions affecting the small refiner that I have described existed. We who were buying so-called legal crude oil had to sell our gasoline in competition
1910 with those who were getting their oil at a very much lower price. The consequence was that we had to sell gasoline at far below the cost to manufacture. In fact, that condition had gone on to such an extent that we were all about broke.

The inventories of gasoline, i. e., gasoline that was held in storage by the larger companies, were entirely too high; so high that the major companies themselves were dumping gasoline on the market. In fact, I think about March 31, 1933, inventories were regarded to be about 10,000,000 barrels higher than they should be, which is a lot of gasoline if it is in excess of what you need. The major companies were trying to get rid of it; the small companies were trying to dump their gasoline; everybody was trying to get on the market at once. The cost of raw material was high, and the return was low.

At the time the Code was adopted there was inserted in the Code a very weak and ineffective sort of allocating system. It provided for allocations by districts not for allocations to individual refineries. The method of doing it was changed in April, 1934.

Mr. Chaffetz: And, if your Honor asks the question, I think the witness will answer that the one thing that was in effect in 1935, the only thing that is pertinent here, was something started in April, 1934.

1911 The Court: I gathered that from what he has said now.

Mr. Chaffetz: Yes.

The Court: Q. Is that true?

A. What was that, sir?

Q. The allocation program in effect in 1935 was the one that was started in April, 1934.

A. Yes, sir, that is exactly correct.

By Mr. Donovan

Crude oil remained at the same price, $1.00 a barrel from September, 1933 to January, 1936.

In January and February, 1934, the posted price of crude oil paid by the principal marketing companies was $1.00 per barrel. All refiners were not paying $1.00 a barrel for crude oil, because they could buy cheaper oil produced in excess of the state allowables, hot oil. The producers in Kansas and Oklahoma never admitted it was hot oil. They produced some over-allowables, but they just called it "excess production".

This resulted in creating two prices for crude oil, whereas there was only one price for gasoline. There was a $1.00 price for crude, and then, say, a 25¢ price for crude. The $1.00 crude cost 2½¢ a gallon; the 25¢ crude oil costs ⅝¢ a gallon. The man who paid ⅝¢ a gallon for his crude oil could sell gasoline at 2¢ or 2½¢, whereas
1912 the man who paid 2½¢ for crude oil at the well and then had to transport it and refine it, could not very well sell it at that price. The refiners who were using this hot oil were located principally in East Texas.

Section 9 (c) of the National Recovery Act had stopped all of us outside of East Texas who were getting this hot oil. My own plant was getting some of it before Section 9 (c), but we had to stop then, and we did stop. From that point on we were up against it. Refiners outside of Texas couldn't get hot oil because it involved the interstate transportation of oil, and the Government had put a stop to that very successfully. The manufacture of gasoline from illegal oil, in addition to making it possible to manufacture cheap gasoline, created a large, excessive product, which we called distress gasoline, which could not find a market, and the consequence was that inventories of gasoline began to build up.

The major companies found that they could not sell gasoline to some of these jobber customers, that used to belong to the independent refiners years ago, at prices that would compete with the illegal gasoline that was getting into the market. The consequence was that their supplies at their refineries started to build up and that created excess inventories.

During the period of the Code, 1934 and 1935,
1913 there were estimated allowables of crude oil which were made by the Petroleum Administrative Board, assisted by the Bureau of Mines. Each month they would estimate the consumptive demand of gasoline that was necessary to meet the requirements, both for domestic demand and for export and for building up gasoline stocks at one season of the year, or for discharging stocks at another season of the year. When they had determined the quantity of gasoline that was necessary, they would figure from that gasoline figure the quantity of crude oil that was needed to supply that gasoline. That crude oil

figure was the quantity that was to be produced by the industry for the effective period. That allowable was then broken up into states, and recommended to the states.

Under the Code those states were not compelled to accept those recommendations, but they did agree that those recommendations would be what they called prima facie evidence of need. In other words, the states would say, "Those estimates are all right," and they would go ahead and approximately conform to them. The basis for fixing state allowables was the recommendation of the Bureau of Mines.

Producing more crude oil than the state allowable created excess crude oil for which there was no market, and resulted in the manufacture of gasoline that was not needed.

There also were regulations under the Code which
1914 prohibited the withdrawal of crude oil from storage.
If you had some oil wells, and you put crude oil in storage, you couldn't take it out without permission. So, if you had a refinery, you would just convert your crude oil into gasoline, and put the gasoline instead of the crude oil into tanks. Consequently, in order to get rid of that excessive crude oil you would make it into gasoline and pile it up.

Refining more gasoline than is needed to meet the current demand creates an excess, distress gasoline and low prices. From the standpoint of a small refiner, distress gasoline is a product which he has on his hands for which he has no immediate sale except at a price below the current market.

The small refiner cannot hold his gasoline until it is possible for him to get a better price. He hasn't any or very much storage. If he built storage, he would not have the money to meet his crude pay-day, that is, the day when he has to pay the producers for their oil. So, generally speaking, he has to sell his stuff as he makes it.

Distress gasoline also can come from excessive inventories. A little weakness hits the market and the major companies, to get rid of the gasoline, dump it just as the
small refiner does. Distress gasoline depresses or
1915 reduces the general tank car price to the refiners.
It is not necessary to have a large quantity of distress gasoline on the market to create this effect. In some circumstances a very small quantity of gasoline will do the trick.

Assume that the market is just a little shaky, say in the fall of the year when everybody is looking for a drop in the consumptive demand and the movement slows up a little, and a refiner has 10 or 15 cars of gasoline on his track that he hasn't sold. He usually wires a broker or a jobber and offers him that 10 cars of gasoline. He probably wires 10 brokers. Then each of those brokers starts calling each other up trying to sell that same 10 cars to each other and starts calling up the jobbers. The first thing you know, it sounds like 100 cars of gasoline, and the market will be hurt.

My illustration applies to the spot market. It is the market on which the small refiner usually trades, or on which he usually sells his current manufacture of gasoline.

When the market is pretty well saturated with gasoline, it won't absorb the surplus offers, and it is under those circumstances that distress gasoline gives the most trouble. The market was decidedly saturated during the first 3 months of 1934.

By the Court

1916 I think the definition of spot market is one that ought to be generalized about. I think people may differ as to a proper definition of "spot market." I don't know that there is any firm, clear definition of the phrase "spot market." A spot market might easily be a spot market to one refiner, and wouldn't be to another. I don't think there is any number of days that you can set as limiting the spot market, unless you get up to the point at which the whole trade doesn't take place. That is, if you make a trade where delivery and acceptance depend upon circumstances that are not included in the original transaction, then I think certainly you are getting away from spot market sales.

In my own experience, I have always operated very small refineries. When we made a spot sale we did not consider very much the number of days that were involved just so they didn't go beyond the time to which we limited our sales. As a matter of policy, we couldn't go very far. In our definition of spot sales, I think if we made a sale on a thirty-day basis, it would be a spot sale in our circumstances.

In the circumstances of some other refiner, who had a large contract business and who did open market trading, which is trading with customers of long standing, where they just ship them goods and put a price on the invoice, I think that would be properly called open
1917 market trading. With them, I think spot sales were infrequently made and were for very, very short

shipments, usually gasoline loaded on track. That explanation is very indefinite and very unsatisfactory. It is hard for me to adopt a trade definition of a sale on the spot market. I don't think there is one. If you show me an order, I will tell you whether I think it is a spot sale or not. That is the best way I can get at it.

Q. Would you say, if I purchased by written contract 1,000 cars of gasoline from you to be shipped, say, in thirty days,—written contract, would that be a spot sale?

A. I don't believe that any sale of 1,000 cars could properly be called a spot sale, because any refiner—

Q. Well, then, what is a spot sale? We have heard so much of it. There must be some definite meaning in the trade.

A. Well, I have heard so much of it, your Honor, that that is my trouble. I thought I knew what a spot sale was.

A spot sale, as far as I am concerned, and so far as my business is concerned, my definition is anything up to 30 days, usually tending toward 10 to 15 days; but in my own experience, going beyond that.

1918 The small refiner usually calls his customer—they don't call the refiner—and asks him if he wants to buy 5 cars or 10 cars of gasoline. Or he wires a broker: "We offer you 10 cars of gasoline for immediate shipment, subject to prior sale," so much per gallon, f. o. b. refinery. Or: "We offer you 10 cars of gasoline, shipment over the next 10 or 15 days," at so much per gallon, subject to prior sale. I don't represent this as a general rule in the trade, but in our own experience, because we made no contracts, if we took a jobber's business for a month, 5, 15 or 20 cars, I would consider that a spot sale, and have so considered it in all my experience. Such sales would be at a flat price.

By Mr. Donovan

By "saturated" market I mean that the market has taken up all the gasoline that it wants, and is beginning to pick and choose on the basis, not of need, but on the basis of price. Inventory position has a very strong effect in some circumstances. In the case of a saturated market it has a very strong effect, because in that type of market the holders of those inventories do not want to be required to carry perhaps large quantities of gasoline over such a market as that, and they begin to offer it in competition with currently manufactured gasoline.

Gasoline inventories were excessive as of March
1919 31, 1934. Crude oil had been produced in excess of
allowables, and had been manufactured into gasoline
and piled up, and there was a little too much gearing up
of refining any way in the spring of 1934.

Q. Now, will you describe the effect upon the small refiner of this market condition which you have described as existing in the early months of 1934?

Mr. Chaffetz: I think we ought to object to that, your Honor. We are still in the spring of 1934. We haven't come to the period that is material to this case.

Mr. Lewin: This question calls for the effect upon the independent refiners, not the cause of the price rise, and not a factor or a feature. He is going to show the effect on these independent refiners way back in 1934. That is what this question is.

The Court: Objection sustained. Exception allowed.

The proposal for refinery control was made about February 1, 1934.

Mr. Donovan: Q. Well at that time was there any provision in the Code designed to protect the small refiner?

Mr. Chaffetz: That is objected to, your Honor.

1920 Mr. Lewin: That is a question of law.

The Court: The Code will speak for itself. Objection sustained. Exception allowed.

Mr. Donovan: I have offered the Code in evidence, and have not been permitted to do it.

Mr. Lewin: It is not relevant.

Mr. Chaffetz: It is irrelevant. Whether there was a provision in the Code to help the refiner is utterly irrelevant in this case.

The Court: You were talking about the allocations then, and the system of allocations was of no value, but in 1934 there was a system.

Mr. Donovan: That is what we are trying to deal with now.

Mr. Lewin: No, the question is whether there was some other provision of the Code in February, 1934.

The Court: We are talking about in April, 1934.

A. Yes, there was an allocation of districts prior to 1934, and after that allocations to individual refiners.

Mr. Donovan: Now, I ask him when the suggestion was made that was incorporated in the Code in April, 1934.

1921 Mr. Chaffetz: You have already asked that, and he answered it, and he said it was in February, 1934.

The Court: Objection sustained. Exception allowed.

I was in Washington in April, 1934 in regard to refinery allocations. I was there as representative of a group and we were attempting to get an amendment to the Code which would provide for a more effective system of refinery control.

Q. In order to do that, did you see the Petroleum Administrative Board, or any members of that Board?

Mr. Lewin: We object to this. It is going back to the formation of that law. I think we ought to start with the amendment itself in April, 1934, as a starting place. This is an attempt to go back to negotiations between this gentleman and some of his associates with regard to forming that amendment. It certainly cannot be competent.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Now, will you tell us the circumstances of the preparation of that amendment to which you refer?

1922 Mr. Lewin: That is the same question, your Honor, and we object to it on the same grounds.

The Court: Objection sustained. Exception allowed.

I proposed an amendment to the Code for refinery control.

Mr. Donovan: Q. What was the nature of your proposal?

Mr. Lewin: We object to that. A proposal would not have anything to do with it. It is the final law.

The Court: No, the results. Objection sustained. Exception allowed.

I accomplished the purpose for which I went to Washington in January, 1934. My purpose was to have a better allocation program worked out.

Mr. Donovan: I ask to have marked for identification the so-called refinery amendment referred to by the witness, certified by the Department of the Interior.

(Document referred to was marked EXHIBIT 835 for identification and received in evidence and read to the jury.)

By Mr. Donovan

Under the refinery amendment the monthly production allowable for the country as a whole was determined 1923 by the Petroleum Administrative Board, with the assistance of the Bureau of Mines. Each month they would calculate the estimated quantity of gasoline that would be needed to meet consumptive demand. They would calculate this by taking the number of motor vehicles that would be in use and multiplying that by the number of gallons of gasoline which experience showed each car would consume within that period. They also would take into account the trend of business conditions. Then they would add to that quantity whatever gasoline was necessary to put into tanks, above and beyond what would be used within that period, that would be used in some later season of higher demand; or, in other seasons of the year, they would subtract from that quantity that would be consumed the quantity that would come out of tanks to help supply the demand. There were other factors taken into account, of course, but in the main those were the ones used.

The country was divided into what finally became 11 districts. Each district was given or awarded its proportion of that gasoline manufactured. That award, or that quota, was fixed each month at a meeting between the National Coordinator and each of the district representatives. These district representatives represented the refiners of each territory, and also were supposed to represent in an 1924 impartial sense the whole national situation. At these meetings, they divided up the national allowable based upon certain rules and regulations, and then they took their quotas home.

Each of these district representatives would go home and call together the representatives of all of the refineries within the district. Based upon certain considerations that were used, this district quantity of gasoline was divided up among each of the individual refiners. That was called a manufacturing quota, and represented the quantity of gasoline that each refiner was allowed to make during that period.

There are a good many of these rules and regulations. In fixing the quantity of gasoline that each refiner got, consideration was given to the quantity of gasoline which that refiner had been accustomed to shipping, considering the season of the year. Also consideration was given to the quantity of gasoline that he needed to store, above what he would ship; or there was deducted from the quantity given him the quantity that he would need to take out of storage to supplement his current manufacture, in those parts of the year when demand was greater than current manufacture.

If a refiner was dissatisfied with his allocation he could appeal to the Board of Review for an increased allo-
1925 cation. The Board of Review consisted of 5 men, who were chosen upon the basis of their experience and the type of operation which they represented in the industry. They were members of the industry. They met each month in Washington. Any refiner dissatisfied with his quota could appeal to that Board in person or by mail.

After the decision of the Board of Review, a refiner could go to the Planning and Coordination Committee, which was an industry body, administrative, rather, more of an advisory body. It had some administrative functions, but not many. From there the refiner could appeal to the Administrator, Harold L. Ickes.

The Code provided for the administration of this article by a National Coordinator. I was appointed Alternate Coordinator on May 1, 1934. I became National Coordinator on March 25, 1935 and continued in that position to the end of the Code.

My duties in that office, in connection with the operation of the Refinery Article of the Code chiefly were to try to avoid, in an administrative way, inequities, to adjust allocations where rules and regulations manifestly had been overlooked or interpreted in the wrong way; in a general way, to administer the operation of the district organizations to the extent only of seeing that they abided by the rules and regulations.

1926 I advised district allocators concerning complaints which were made to such allocators by major companies who felt that their allocations were too small. If we felt the circumstances permitted it, I urged the district allocators to influence the companies to supplement their supply of gasoline by going on the market and buying. Some district allocators followed our advice and some didn't.

A result of that policy, and of what I told the district allocators, in dealing with these major companies who asked for increased allocation, was to cause, in many cases, the major companies in the various districts to buy gasoline. In some cases they made such purchases from semi-integrated companies; in a few cases, from integrated companies. I think in the main, they made those purchases from small, non-integrated refiners.

Q. Was the policy that you pursued consistent with the purpose and policy which brought into being this amendment?

Mr. Crawford: We object to that as irrelevant, immaterial, a conclusion of the witness, argumentative, and everything else is the matter with it, too.

The Court: Objection sustained. Exception allowed.

Q. Will you state to the Court and jury the purpose of the Planning and Coordination Committee 1927 and of the Secretary of the Interior in drawing up this amendment?

Mr. Chaffetz: That is objected to, your Honor; the purposes recited in the amendment were read to the jury.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, may I have the opportunity of presenting a—

The Court: You may—offer of proof?

Mr. Donovan: Have you ruled on the other question that I have asked about?

The Court: Yes, I have, and I won't disturb that ruling.

Independents or non-integrated refiners do not have any substantial storage capacity. They do not have any appreciable refinery stocks of gasoline because they haven't even the storage in which to put it nor the money with which to pay for it as a general rule. There are exceptions.

There was an inventory sub-committee of the Planning and Coordination Committee. I was a member of that subcommittee. It made recommendations respecting the quantity of gasoline that should be held in storage from time to time. Over any period about 25 major companies hold most of the gasoline inventories in the country. As 1928 far as I know there never has been a time when the so-called small refiner had any considerable quantity of storage gasoline. The 25 majors would include every defendant in this case who is a major company.

The gasoline inventory levels as of January 1, 1935 were about 53,900,000 barrels, or approximately 54,000,000 barrels. That was very low. On January 1, 1934, the inventories were slightly higher than that. The gasoline stocks at that time, January 1, 1934, were excessive. The stocks on January 1, 1935 were quite low, and it was that situation that I wanted to have, as National Coordinator, because of the fact that it would create a firm situation in the market. As a result of such a firm situation, we would have a higher price for gasoline. The effect of low inventories upon major company purchases was to increase the purchases.

As National Coordinator, I did not feel that we could keep the major companies at such an inventory position as they were in on January 1, 1935. I made an attempt to devise a system to maintain this advantage.

Mr. Donovan: Q. What did you do?

Mr. Lewin: Objected to.

The Court: Overruled. You may answer.

1929 A. We had a situation during that period, January and February, 1935, that was disappointing.

Mr. Lewin: I object to this as not responsive to the question.

The Court: The question is, what did you do. What did you do?

Mr. Chaffetz: May that answer be stricken out, your Honor?

The Court: It may be stricken out. Exception allowed.

Q. Did you see the Administrator about it, about the situation?

Mr. Lewin: That is objected to.

The Court: You may answer that.

A. I saw members of the Petroleum Administrative Board.

Mr. Lewin: I move that be stricken out as not responsive.

The Witness: I figured that he was the Administrator, your Honor.

Mr. Lewin: The Administrative Board was not the Administrator.

The Court: That isn't my understanding. I understand Mr. Ickes was the Administrator.

The Witness: They were his representatives.

1930 The Court: Q. The question was, did you see Mr. Ickes?

A. No, sir.

Mr. Donovan: Q. Did you see any members of the Petroleum Administrative Board?

Mr. Lewin: I object to that as totally irrelevant and immaterial. They had no power at all. The administrator was the only man that had power under that Act. The Petroleum Administrative Board simply assisted him in an administrative way; and any conversations this gentleman had with them could have no effect.

Mr. Donovan: I will ask this witness what the duties of the Petroleum Administrative Board were.

Mr. Lewin: I object to that, as a matter of law. This gentleman is not qualified to testify as to questions of law.

Mr. Donovan: May it please the Court, I offer the Code of Fair Competition in order simply to avoid further dispute as to the duties of the Petroleum Administrative Board, and I ask—

Mr. Lewin: I object to that.

Mr. Donovan: Just a moment. That is Exhibit 710 for identification.

1931 Mr. Lewin: I object to that as an attempt to do indirectly what can't be done directly. That is all it could possibly mean. That has been ruled on a number of times.

Mr. Donovan: I am now offering the Code, your Honor, Exhibit 710 for identification.

Mr. Lewin: We object to it.

The Court: Objection sustained. Exception allowed. The witness may testify as to what the duties of that Board were—if you remember.

The duties of that board were to advise and assist the Administrator, and they had certain administrative functions. I went to the Petroleum Administrative Board in ~~January, 1935~~.

The Court: Q. What did you do yourself after January 1, 1935, about increasing the purchase of gasoline in that locality?

A. In several instances I discussed with representatives of the major companies their individual inventory situations, in relation to their requirements for gasoline. They wanted to get more—larger quotas—and in many cases we urged them to buy gasoline. That bears directly on your question. Indirectly, we did other things to accomplish the same purpose.

1932 The Court: You have answered the question. That answers it.

The Administrator wrote a letter to Mr. J. D. Collett, Chairman of the Planning and Coordination Committee, relating to this subject, on January 2, 1935. That is Mr. Ickes' signature on this letter headed "Administrator for the Petroleum Industry; Interior Department Building, Washington," dated January 2, 1935, addressed to Mr. J. D. Collett, Chairman, Planning and Coordination Committee, Investment Building, Washington, D. C.

(Letter referred to received in evidence as EXHIBIT 836.)

The stocks were lower on January 1, 1935 than they were on January 1, 1934.

The tendency was to increase inventories in the winter, up until March 31st; and at every point the National Coordinator's Office wanted to have them a little on the low side instead of a little on the high side, because we knew it was easier to step up manufacturing a little bit than it was to dispose of distress gasoline. So we tried to keep them on the low side.

Fundamentally, of course, the purpose of stocks of gasoline was to have enough for folks to use. The incidental purpose and the purpose from the standpoint of the 1933 administration of the refinery section of the Code, was not only to provide enough gasoline to supply the demand, but to create a market condition which would be firm. We thought that was the underlying purpose of the whole works.

(Mr. Donovan read Exhibit 836 to the jury.)

In Exhibit 836 Mr. Ickes mentioned an objective figure of 65,000,000 barrels for March 31, 1935. During the first 2 months of 1935, this objective inventory was changed from time to time. I don't remember the dates. It was changed once to 65,100,000 barrels; and then it was changed to 65,700,000 barrels; and then it was finally advanced to 66,280,000 barrels. That was the final objective for March 31, 1935.

We had an objective inventory for each company. The total of all the companies had to come within the objective figure that I have mentioned of 66,280,000 barrels.

We arrived at that figure of 66,280,000 barrels in this way: There were about 25 large companies that held practically all of this gasoline. We just called them all in, and asked them to tell us how much gasoline they thought they should have. They told us. Then we held hearings of the Inventory Sub-Committee, of which I was a member. We took each company at a time and went over its

1934 figures. We knew that those companies knew better than we did what they ought to have. But we had on that committee men who were qualified to criticize the figures they submitted, men who carried on operations just the same as those men did, practical men. We analyzed all of those requests that they made for the purpose of deciding whether or not they were a proper basis. These 25 companies asked for more than they got. My recollection is that adding up all that each company asked for and putting it all in one basket, it amounted to 71,000,000 plus barrels.

I know Mr. E. B. Swanson. He was a member of the Petroleum Administrative Board in the Department of the Interior in 1935. He is now a member of the Petroleum Conservation Board of the Department of the Interior.

Q. And in the latter part of February 1935, did you have a talk with Mr. Swanson relative to the condition of the independent refiner?

Mr. Chaffetz: That is objected to, as not material.

Mr. Lewin: It seemed to me that, if I understood your Honor's ruling, your Honor's overall ruling correctly, that you were going to permit the defendants by this witness to give the jury some factors
1935 other than major company buying activities that might account for that rise in price and the stabilization through 1935 and 1936. One of those factors you were going to permit the jury to hear about were these allocations, cutting down on the amount of supply.

Now this question, although asked under the guise of that objective, is now going into a conversation which can't have the force of law, or the force of reason, or any other force—between a member of the Petroleum Administrative Board, which was an administrative agency in the Department of the Interior. He is not going to talk about any conversation with the Board, he is not going to talk about a conversation with the Administrator, but with one member. What about? Not about these allocations, which might, under their theory, tend to explain to some extent that sharp rise in prices and that maintenance, but about the plight of some independent refiners. Now, I say, that obviously, that lies totally outside of your Honor's very generous ruling, we think, to the defendants, to go into that kind of subject at all.

Mr. Donovan: And may I, before your Honor rules, may I ask one other question?

1936 The Court: Yes.

Mr. Donovan: Q. Did your conversation with Mr. Swanson relate to refinery allocations?

A. It related to inventories and refinery allocations.

The Court: Q. What authority or power did Mr. Swanson have that you didn't have with reference to these allocations?

A. Your Honor, the Petroleum Administrative Board was the Board which fixed the figure which made up the total gasoline we could manufacture; and if I may, I will state the purpose of the visit—

The Court: No. Was he on that—I am asking you, what authority or what power he had that you didn't have, with reference to making these allocations?

A. He had it all, and we had none; that is this national figure, the national figure—

Q. I am not talking about Mr. Ickes; I am talking about Mr. Swanson, one of his employees.

A. I say, the national gasoline manufacturing figure was made by the Board of which Mr. Swanson was a member.

Q. Yes, but he had no more authority than you had, did he? You were both members of the same

1937 Board?

A. Oh, no, your Honor. He was a member of Mr. Ickes' Board, the Petroleum Administrative Board; and I was a member of the Planning and Coordination Committee.

Mr. Chaffetz: Q. Was he chairman of the Board?

A. Mr. Chaffetz, the single word answer to that is no. But may I add that he was the member of the Board directly charged, by reason of his particular knowledge, with the initial review of refinery matters.

Mr. Lewin: Q. Were his decisions final?

A. They were not.

Mr. Lewin: All right. He was nothing, nothing in the world but an employee in the Government department, like I am an employee in the Department of Justice,—just in such a capacity, having no more power to administer law and to hand out law and to make law, he had no more power to do that than

I have, and I have absolutely none. Now, it certainly can't have any bearing.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: On that, your Honor, I should like to submit an offer of proof.

1938 The Court: Yes, you may.

(In the absence of the jury.)

Mr. Donovan: May it be understood that the same ruling would apply that your Honor made the other day, as to these offers of proof, as if made in question and answer form; and as to each of the several parts, as well as the whole?

The Court: Yes, the record may so show.

Mr. Donovan: The first offer of proof, your Honor, is in relation to the conversation had by the witness Shatford with Mr. E. B. Swanson of the Petroleum Administrative Board, on February 28 or March 1, 1935.

"If John E. Shatford were permitted to testify, he would testify as follows:

"In February, 1935, the office of the National Coordinator made an investigation of the effect of the Code on small refiners. It was found that 20% of the refiners operating at the time the Code was adopted had gone out of business by January 1, 1935. This information was turned over to a representative of Platt's Oilgram, who published an article on February 27th concerning such facts.

"On February 28, 1935, E. B. Swanson, a member of the Petroleum Administrative 1939 Board knowing that the information for this article must have emanated from the National Coordinator's office, went to the office of the National Coordinator and discussed the situation of the small refiner with Mr. Shatford. Mr. Swanson took issue with Mr. Shatford on the number of refineries that had shut down due to the operation of the Code, but stated that he knew the situation was bad and something must be done quickly to help the small refineries. During this conversation, Mr. Shatford and Mr. Swanson discussed the latest American Petroleum Institute figures on inventories. The figures for the week ending February 23, 1935 were available at that time. The available weekly inventory figures for February disclosed that inventories were rising more rapidly than had been estimated. Shatford and Swanson recognized the fatal effect upon the market of this situation. In their discussion they stated that instead of eliminating a buyers market, this accumulation of inventories would accentuate the unfortunate plight of the small refiner. They also stated that the situation could be corrected by bringing the inventory level down to the objective for March 31, 1935.

"It was decided by Mr. Shatford and Mr. 1940 Swanson that something had to be done, and knowing that any action would have to be based on accurate information, Mr. Shatford, after informing Mr. Swanson, sent a request on March 1st to 25 or 30 major companies asking for a revised estimate of each company's inventory position as of the end of February, 1935."

Mr. Donovan: Now, the next is in relation to conversations with E. B. Swanson and Charles Fahy, both of the P. A. B., and J. D. Collett—

The Court: Before you get to that: Everything except the fact that he had the conversation is in the record now.

Mr. Donovan: Your Honor, the conversation, we claim, has a very important bearing on this whole proceeding, as showing the relation between the National Coordinator and the Petroleum Administrative Board and the recognition of this situation by the Petroleum Administrative Board.

Mr. Chaffetz: If there was an issue of the legality of the allocations, and the question was whether that was being done with authority, then that kind of testimony conceivably could be pertinent, but we are not dealing with what the relations were between the Interior Department and the National Coordinator with respect to allocations. The only 1941 thing that is pertinent in this case is what were the effects of allocation upon price during this period; and I am sure that has been covered just as fully as it possibly could be.

The Court: The objection to that offer of proof will be sustained. Exception allowed.

Mr. Donovan: In these conversations with Mr. E. B. Swanson and Charles Fahy, both of the Petroleum Administrative Board, and J. D. Collett, Chairman of the P and C Committee, on March 7 and 8, 1935:

"If John E. Shatford were permitted to testify, he would testify as follows:

"On March 7th Mr. Shatford again saw Mr. Swanson and solicited his further advice and help. They discussed the advisability of requesting the major companies to reduce the March manufacture of gasoline so that the majors would be forced to buy part of their requirements. Mr. Swanson told Mr. Shatford that he thought the best basis to adopt for requesting the curtailment would be to ask each major to curtail its March production by the amount by which each had underestimated its inventory position as of February 28th. Mr. Swanson stated that, if requests were made for 1942 voluntary curtailment, Mr. Shatford should have the approval of the Administrator. On March 8, 1935, Mr. Shatford saw Mr. Collett and discussed the plan for making the request for voluntary curtailment.

"On the same day, March 8, 1935, Mr. Shatford conferred with Mr. Swanson again after preparing a draft of the wire which he proposed to send out. Mr. Swanson read the draft, but stated that Mr. Fahy, Chairman of the Petroleum Administrative Board, was the person who should handle the approval of the wire.

"Following the conversation with Mr. Swanson on March 8th, Mr. Shatford saw Mr. Fahy. Mr. Fahy stated that he approved of the plan, but that it would be necessary for him to get the Administrator's approval and to do that he would have to see the Administrator personally. Mr. Fahy was afraid it would take some time for him to be able to see the Administrator, but later on the same day, March 8, 1935. Mr. Fahy talked with Mr. Shatford and told him that the telegram was satisfactory and could go out."

Mr. Donovan: Now, your Honor, I am directing this to the point I tried to make, as I made proffer of this testimony during the course of this trial; and it was to show the manner in which the witness, 1943 the National Coordinator, cooperated with the Petroleum Administrative Board, how that Board cooperated with him in the accomplishment of the purposes of the refinery amendment.

I want to show the entirely informal way in which all of these things were done, and the way in which Mr. Shatford dealt with Mr. Ickes.

Mr. Chaffetz: Let's deal with it once and for all. It is the question of informal as against formal approval.

Mr. Donovan: Now, if it please the Court, I was just thinking as Mr. Chaffetz was making his argument, that every time we make an offer of proof directed to a specific thing here, where Mr. Chaffetz thinks it may hurt the contention of the Government, we are led off into a long discussion of what is not presently before your Honor now.

But on that, let me say finally what I have said many times: We claim that what was done by us did not come within the provisions of this section of the Code to which he refers, just as Mr. Francis has said. I have said repeatedly, your Honor, that we are not coming in here and claiming exemptions or immunity under that section. We say what we did was right and proper, and we will
1944 undertake to show the circumstances under which the Govermental bodies had knowledge of what we did and what they did in relation to that. That is perfectly simple.

And now all our proof is directed to here, and all our questions were directed to, was to show an administrative interpretation of the conduct of things, which is this, by the P. A. B. Board, by the National Coordinator and by those charged with the administration of the Code. Judge Beaty makes that clear. And that is all we are trying to do here.

Mr. Lewin: I got up here the other day and gave you my assurance that there isn't such written approval. Your Honor knows the law and knows that oral approval isn't enough. The law is perfectly clear as to what is approval. If you don't have that approval, then you are under the Sherman Act, and no amount of oral talky-talky between these people and people in the Department of the Interior can do them one iota of good in taking them out from under the Sherman Act.

Now, that certainly is the issue.

Every time we try to get a categorical answer to that question, we get evasions, your Honor, 1945 until Mr. Francis the other day, I thought, hit the question on the head. He put it this way: He says we are not under that amendment. Well, if he is not under that amendment, he is not under anything, because that is the only provision of the Code they could be under. The only way you can run an arrangement to buy distress gasoline is to be under Article 4, Section 6. If you are not under that amendment, and that is the position they want to take, and Mr. Francis speaks for them, then they can't get any approval, oral, written, implied, expressed, or anything else, and then only the Sherman Act applies, and then the N. I. R. A. has no relevancy whatever. If they are not under Article 4, Section 6, then they are not under the Code at all, and all this talk about the Code, except insofar as it affects that price, is irrelevant.

That is what I understood your Honor's view was. And I didn't totally agree with it. I thought we might get a more narrow ruling. I thought we were entitled to it, but I felt there was a great deal to be said for the other point, and that was when you come to explain that price rise, they might be entitled to show that something in addition to 1946 those pools had an effect upon it. Allocations might have an effect on it, and since allocations were allowed under the Code, you took that portion of the Code into the evidence, although I didn't like it. I felt that it was giving them much more than they were entitled to under the law, because it doesn't seem to me that it makes any difference whether there was some other effect on that price rise or not, so long as this had its effect; nevertheless, we have acquiesced in that ruling of the Court, and we have allowed a lot of evidence to be admitted without any quarrel about it at all.

I thought that was going to be a fairly narrow thing; I thought your Honor was going to permit them to show that there was a provision of the Code in 1934 for allocations, and those allocations were applied by the National Coordinator, Mr. Shatford, and they sent out telegrams, making prognostications of inventories, and if not on legal authority, they had to hold those inventories down, and let the jury, though finally conclude as to whether or not that cutting down of supply affected that price.

Now, that is what I thought you were going to do. This particular offer of Mr. Donovan says, "We have got this Code into the record. Let us 1947 look at it." Now, he wants to show not only that Mr. Shatford did that, and that had an effect upon the price, but that Mr. Swanson and Mr. Fahy of the Petroleum Administrative Board knew that he was doing it and gave their oral consent. And he wants to go even further and show some hearsay statement of the Secretary of the Interior that he knew what they were doing.

Now, I say that is totally irrelevant. That didn't have an effect upon the price. What they said didn't have an effect on the price. If this had any effect on the price, it was because Mr. Shatford did nothing to keep it from affecting the price. We haven't challenged the legality of that. We have just taken that as an objective fact.

No other reason for going into conversations with Fahy and Swanson on this stand now except to lay a basis for some kind of highly inadequate oral acquiescence or approval of the Secretary of the Interior of the thing charged in this case.

The Court: I have already ruled that he will not be permitted to relate any conversations he had with Mr. Swanson, and I am not going to change that ruling. Exception allowed.

1948 Mr. Dorr: We are not saying that what the government says or does gives us immunity against the Sherman Law. We say what the government is trying to do is one of the facts of the business, one of the facts of the circumstances of the situation, which must be taken into consideration, which the court will take into consideration in determining whether or not the restraint was reasonable.

Mr. Wood: I say, if your Honor please, that this evidence is admissible to show not only facts and circumstances upon which we rely as indicating that we didn't do what we are charged with having done, that this was some different kind of a program from that which the Government says it was; but also as bearing upon the administrative interpretation of the Code by those charged with this administration, including the Administrator himself, and his immediate advisers, the Petroleum Administrative Board, for what bearing that has upon our objectives and purposes, and upon the legality of what we did.

If you read those two official documents together, Annual Report of Secretary of Interior for 1935 and Final Report of Petroleum Administrative Board—
1949 Marketing Division, it is perfectly plain that this cooperation to which the Secretary refers in his report of 1935 was the cooperation with this Tank Car Stabilization Committee. I think it is plain on its face.

But my point is, plain or not, we are entitled to offer the facts as to this cooperation. If it was cooperation with something else; then what I have read here, standing alone, doesn't get us anywhere. If this was cooperation with this, it certainly does.

The Court: Oh, well, if you are going to have anything as important as this, that regulates an industry so important as this—

Mr. Donovan: But, your Honor, there were a hundred things done that way.

The Court: (continuing) —you would certainly expect written approval.

On the last offer of proof the objection of the Government is sustained. Exception allowed.

(In the presence and hearing of the jury)

By Mr. Donovan

I think Mr. Swanson was not also in the Bureau of Mines at that time, but I may be mistaken about that. I am not entirely sure on that point. My impression is that he was not.

1950 The administration of the Refinery Amendment, with which I was concerned, was subject to rules and regulations made by the Planning and Coordination Committee, and subject to quantities of manufacture fixed by the Petroleum Administrative Board and approved by the Administrator. The Administrator had final approval of the figures that were used as a basis for allocations.

Q. How was that information brought to him? He could not determine it himself, I assume.

Mr. Lewin: Well, now, why should you assume any such thing, and how does this man know?

Mr. Donovan: Because I am just an ordinary human being, and I know the capacity of one man to work.

Mr. Lewin: Well—

Mr. Chaffetz: Counsel isn't testifying.

Mr. Donovan: Well, I was asked the question.

Mr. Lewin: Your Honor, regardless of his capacity, he is charged with a duty of law. If he can't do it, nobody can do it; that is the size of it. He may have people that work for him, that bring him papers, that hand him a pen and all that sort of thing, but he has got to do it, if anybody can. Nobody else can exercise the Administrator's functions 1951 but himself. And if your Honor could only know all the conversations that go on down in Washington, between the underlings, you just wouldn't have any patience with this at all.

Mr. Thomas: I except to the statement of counsel that if the Court and jury could know what went on in Washington, and so forth, as prejudicial; and the jury ought to be instructed to disregard it.

Mr. Lewin: They are asking for conversations between people that are minutiae in Washington; that is all they are. We talk about everything—

Mr. Thomas: I except to the statement of counsel just made in the presence of the jury. It is unnecessary to have those statements.

The Court: Well, the jury may disregard what has been said here.

The Code fixed the method for determining the national allocation. It was fixed by the Petroleum Administrative Board, and taken to the Administrator and approved by him.

In carrying on my duties as National Coordinator I usually carried refinery matters to Mr. E. B. Swanson. I would consult with him about all refinery matters that I had to take up with the Petroleum Administrative Board if 1952 he was there, and if he were not, then with Mr. Charles Fahy, who was chairman of the Board. There were 5 members on that Board. During the period of early 1935, the chairman was Charles Fahy. The secretary of the Board, and a member of it, was Norman Meyers. The additional members were E. B. Swanson, J. Howard Marshall and Dr. John Frey. Mr. Swanson submitted the matters which I took up with him to the Board.

After receiving the approval from the Administrator, Mr. Ickes, for the March gasoline manufacturing schedules, which was received early in February, and which provided for the manufacture of a definite quantity of gasoline for current consumption, and additional definite quantity to be put into inventory to be used in June, July, August and September, we investigated the question of accumulation of inventories or stocks of gasoline which had currently taken place during the months of January and up to that time in February.

Q. And then what did you do after you had accomplished that?

A. Your Honor, am I barred from talking about conversations with the Petroleum Administrative Board? They were the boss on this gasoline business.

1953 Mr. Lewin: Well, now, we—

The Court: No, they weren't. Mr. Ickes was the boss. Get that straight.

A. The Code says otherwise, your Honor.

The Court: You just take it from our understanding now here that Mr. Ickes was the man that approved.

Mr. Chaffetz: As long as he is permitted to state what they actually did—.

The Court: Yes, you can tell us what you did after any action was approved by Mr. Ickes.

About March 1, 1935, we wrote letters to all of the major companies who stored gasoline, asking them to wire in and give us the actual quantities of gasoline which they had in their tanks on February 28th. We did this so we might compare the figure of the gasoline they actually had with the figure which early in February they had estimated that they would have.

(The witness then explained a model of a refinery.)

This plant costs about 20 to 25 million dollars; it was built in about 1912.

Small refineries suffered a great deal from the fact that technological development—that is, the increased skill in the art of refining—proceeded so rapidly that it caused the obsolescence, or the junking, of equipment almost as fast as it was built, as new ways were found of cracking gasoline from year to year. 1954

But the outstanding feature is that those 4 little cracking units and that one there (indicating), do all of the work that was formerly done by all of these stills here (indicating);

and this equipment, costing between 4 and 5 million dollars, is out of use—is just junked.

A large company can absorb that kind of a loss. But think what it means to a small company to invest 4 or 5 million dollars in a cracking plant; to have repeated cases of that, where you build a cracking plant and find out in a year that it is no good; you have to add to it and add to it, and then finally tear it all down and build another one—because that is just exactly what happened.

The Petroleum Code provided that the total allocation of the country should be made by a Federal agency, not refinery allocations. The Department of the Interior was the Federal agency referred to in the Code. I knew that the Department of the Interior designated one agency to carry on the work. The Petroleum Administrative Board, aided by the Bureau of Mines, would fix the national total. They would do that in consultation, as provided in the Code, with the Planning and Coordination Committee, and such other agencies as they saw fit to advise with.

1955 Then they would pass that national figure to us, the industry code authority. Then our refinery organization would break it up into districts and send it back; and the Administrator would take a look at that break-up to see if he thought it was all right. In doing that, he received the advice and consent of this Federal agency. If he approved it, then we could send it back to the districts, and the district agencies would break it up to individual plants.

On March 1, 1935, a representative of this Federal agency talked with me in connection with the March allocation.

Q. Did he discuss with you the question of March allocations?

Mr. Lewin: Now, that is objected to. That is the same thing that your Honor ruled on before, except the other time he asked whether Mr. Swanson had this conversation with him.

Mr. Donovan: Well, the other time, your Honor, there was some question of the source of authority, and of the right of the representative to discuss this matter with the witness. Now, I have tried to show just what that source of authority was.

Mr. Chaffetz: I think the situation today is identical with what it was when your Honor ruled this morning: Conversations with individuals are not

1956 helpful; and we are still talking about a conversation with an individual. There is no showing that that individual was the agency.

Mr. Lewin: We still have the distinction, your

Honor, between the action of the Board within its powers and the action of some individual on the Board having a conversation with this gentleman.

Mr. Chaffetz: And it isn't even action we are talking about; it is purely a conversation that is sought to be adduced here.

The Court: Objection sustained. Exception allowed.

Mr. Margold, Chairman of the Petroleum Administrative Board, at the outset of the Code, had instructed me, as he expressed it, in order to facilitate the handling of refinery matters, to deal with Mr. Swanson; on marketing matters, to deal with Mr. Frey; on production matters, to deal with Mr. Marshall and Mr. Meyers.

(Copy of letter produced by counsel is marked Exhibit 838 for identification.)

Exhibit 838 for identification, dated March 1, 1935, addressed to F. H. Holsten, Barnsdall Oil Corporation, Petroleum Building, Tulsa, Oklahoma, is one of the letters that I sent out on March 1, 1935. I signed the name "Howard Bennette" to the letter. I was then the Alternate National Coordinator, and Mr. Bennette was my
1957 superior, and I signed his name at that time.

(Document referred to received in evidence as EXHIBIT 838 and read to the jury by Mr. Donovan.)

Similar letters were sent to all major companies. I received replies to those letters. We prepared a summary of those replies. The sheaf of papers containing figures, headed, "Comparison of Gasoline Stocks, Estimated February 28, 1935, Summary," is the summary to which I have referred. That summary was made on or about March 8th as of February 28.

(Document referred to is received in evidence as EXHIBIT 839.)

When we got this information we found from an examination of it that gasoline stocks, inventories, in the hands of these companies as of March 1st were 1,400,000 barrels higher than those companies had said early in February that they thought they would be, when they made the best estimates that they possibly could in advance of March 1.

After that we undertook to procure authority to withdraw or to persuade these companies to withdraw from manufacture during March a quantity of gasoline approximately equal to the quantity of gasoline, 1,400,000 barrels, that we found they had in excess on March 1st, of what they had expected to have.

1958 Mr. Lewin: Your Honor, in order for that answer to stand I think it ought to appear what companies they were going to persuade, because he is talking about major companies generally all over the country.

I have further objection to the answer, and that is that he undertook to obtain authority. I thought the question was only going to be what they did and not what they attempted to do.

The Court: That is what I thought the witness was to keep in mind.

A. It is obvious he couldn't do it without authority, and I thought you would want to know what the authority was.

The Court: I assume you wouldn't do anything without authority.

Mr. Donovan: Your Honor, in order to find out what these companies did, it is necessary to find out what they were asked to do. That is what I am going to do.

The Court: Q. Can you name those companies? What companies were they? Have you any record of those?

A. Yes, sir. They (indicating defense counsel) have the record. I could name the 23, but it would waste your time.

1959 *By Mr. Donovan*

I consulted with those 23 companies to make that curtailment that I spoke of.

Mr. Lewin: Do I understand this was by authority of the Administrator?

A. Yes, sir.

To ask those companies for action to make that curtailment, I sent them telegrams.

Mr. Donovan: Q. First of all, I give you a list and ask you if those are the companies to which you sent the telegram (handing paper to the witness)?

A. Yes, sir.

Mr. Lewin: Does that mean the companies that had the excess stocks?

A. They were the companies to whom we sent the telegram, not all of whom, from our point of view, had excess stocks.

Mr. Lewin: I think we are more interested in the ones that had excess stocks rather than the ones they sent the telegram to.

The Court: Read it. As you read along there, can you indicate which ones did have excess stocks?

A. Your Honor, may I say this that in saying which had excess stocks, I am expressing the point 1960 of view of the administration of the refineries code. I am not attempting to say from their point of view which one had excess stocks.

The Court: Q. In excess of what it ought to be?

A. That is correct. These companies in the aggregate had 1,400,000 barrels too much, and some of them had most of that, most of that excess over what we thought there ought to be.

By Mr. Donovan

May I explain that the weather in February, 1935 was terribly bad, and the country's consumption did not measure up to our expectations of the demand, and it was for that reason that there were excess stocks.

Telegrams were sent to the following: Atlantic Refining Company; Barnsdall Refining Company; Cities Service Oil Company; Continental Oil Company; Gulf Refining Company; Mid-Continent Petroleum Corporation; National Refining Company; Phillips Petroleum Company; Pure Oil Company; Richfield Oil Company of California; Rio Grande Oil Company; Shell Union Oil Corporation; Sinclair Refining Company; Skelly Oil Company; Socony-Vacuum Company, Inc.; Standard Oil Company, California; Standard Oil Company, Indiana; Standard Oil Company, New Jersey; Standard Oil Company, Ohio; Sun Oil Company; Texas Company; Tide Water Associated Oil Company; and Union Oil Company.

1961 We sent the same telegram as the telegram to E. B. Reeser, president of Barnsdall Oil Company, Petroleum Building, Tulsa, Oklahoma, which is dated March 8— the only variance, I think, being the quantity of gasoline which we asked them to withdraw from manufacture— to all of the above-mentioned companies. That variance depended on the extent to which their stocks were too high, as we saw it.

(Telegram referred to is received in evidence as EXHIBIT 840, and read to the jury.)

This curtailment program had the approval of Mr. Ickes.

I received replies to these telegrams by telegram, letter and personal visits, principally in writing.

Most of the companies complied with the request. A few of them did not, but in those cases their replies indicated a situation which made it impossible, from their point of view, to comply.

There was a curtailment by those companies as the result of my request of 960,000 odd barrels, I think. This curtailment had the effect of reducing refinery production.

Q. What effect did that have on the market situation?

1962 Mr. Chaffetz: That is objected to. That would be purely a conclusion of the witness and involves a lot of factors.

The Court: It just took that much gasoline off the market.

The Witness: That is correct.

Mr. Donovan: Q. Did that affect the price?

Mr. Chaffetz: That is objected to. That is a question for the jury, clearly.

Mr. Donovan: Well, your Honor, the witness has said before this that a part of his entire program was an endeavor to, what he said, firm the market, and force the major companies to buy. He said that two or three times. I want to find out—

The Court: That is a pretty big order for him to tell us just how much effect it had on the market. There might have been some other things entered into it. If he can answer that question he may. Did that alone—

Mr. Chaffetz: I will say this: This is just a question of the amount of inventories that we are dealing with.

The month which we call the month in balance is perhaps the last 2 weeks of September and the first 2 weeks of October. Taking it by months, in October we begin to build inventories; build them during October, November and December, January, February and March; and on March 31 we reach what we call our spring objective.

1963 Mr. Chaffetz: I understand it, the witness testifies that this did have reference to the amount of their inventories as of that time. That is what I think he was dealing with during this period, not the amount of gasoline that was being sold on the market.

The Court: Q. At that time, these communications you had with these major companies, was that pertaining to their inventory?

A. It pertained to their inventory alone.

Q. You wanted to get this down to what you thought it ought to be at the end of March?

A. Down to what we thought it ought to be to produce a certain effect.

Mr. Donovan: Q. How did you want them to get it down; get their inventories down?

The Court: You may answer that.

A. By reducing the manufacture.

Mr. Donovan: Q. By reducing their production?

A. That is correct.

Q. Now, what effect—I ask what effect that had upon price?

Mr. Lewin: Your Honor, as a basis for intelligent objection, I would like the witness to be asked some more questions about this. In the first place, 1964 the point at issue, as I understand it, is what effect did that have on the Mid-Continent and East Texas tank car price. Here comes a lot of general testimony about efforts made to major companies as a group. Finally, he did give us a list of a lot of major companies—some of them not involved in this case at all—some of them their transactions may not affect the Mid-Continent price an iota. I asked them to have a list of those companies that had excess stocks. I was told that some of them had excess stocks, and some of them maybe did not. Some of them curtailed or said they were going to curtail. Four or five of them did not—

Mr. Thomas: If the Court please, I don't like to interrupt counsel, but he is making a statement that is improper before the jury.

The Court: He is making a re-statement of what I think this witness has testified.

Mr. Lewin: Your Honor, I think, before we go any further, we ought to know now, so that we can tell what bearing it has on the issues here, which, at least, of the particular defendants, which of these companies in March, when we say this buying started, had more gasoline than they ought to have. Now, I think we ought to have that right now before we

go any further along this line, since the particular
1965 issue is whether or not these activities had an effect on that tank car price, which is the subject of
this suit.

The Court: I think you are right.

Q. Have you that information with you?

A. I can undertake to provide that to you, if you want it.

The Court: I think we ought to have it.

The Witness: May I make a statement to you, either one way or the other, out of the hearing of the jury, or somewhere else, so that I can properly know what I am to take into account in determining whether or not they had excess stocks.

The Court: I think what we have in mind is this: Take the defendant companies named here who did business in this Mid-Western district.

The Witness: Yes, sir.

The Court: In working out your allocations, you had certain expectations as to what their inventory would be at the end of March 31—

The Witness: March 31, yes, sir.

The Court: From your records can you show what your expectations were—

The Witness: Yes, sir.

The Court: And then from your records show what that actually was or would be about March 31?

1966 The Witness: Yes, sir, we have all of that.

The Court: All right. Just work that out.

The Witness: If you intend to confine it to the gasoline they held in these 10 states, it is not worked out.

The Court: That is, of course, all we are concerned with.

When we speak of excess stock, we speak of it in terms of how we viewed it for our purposes, not the way the companies viewed it for their purposes. This excess stock had to do with the inventory objective which I, as National Coordinator, felt was the desirable objec[illegible] on March 1, 1935, for our purposes.

Our records were all worked out, and we knew what the stock on hand on March 31, 1935 ought to be in order to stabilize the price.

Mr. Lewin: Before we proceed further with this kind of testimony, because I think unless it is narrowed it is harmful, may we not know which of these companies held these excess stocks in March?

The Court: That is exactly what he will find out by Monday morning. He will not have time to do that now.

A. Yes, I think I can give it as to those 10 states.

1967 (Testimony resumed after a recess.)

I have a compilation here which is not exactly what was asked for. It comes as close to it as practical circumstances will permit, and if I may, I will show you in just a moment on the map the difference between what you asked for and what we have. Oklahoma does not lie within the 10 states defined.

We have included in the gasoline stocks which we have reported on this chart the gasoline stocks which were held in what we call refinery district 3, which comprises this central territory here (indicating) and the district 4 which includes Kansas and Oklahoma. The reason for that is this: The stocks of gasoline which move into this market, the Mid-Western area, and which supply this market are both manufactured and held to a considerable extent in this area; consequently it was necessary to include that to give a proper picture of the thing.

We did not include any gasoline held in East Texas, in spite of the fact that that gasoline does move at times into this territory, that is, the 10 states that the Court defined as the Mid-West territory. It may appear that we should have done that, but the fact is that there are no stocks held there. This is what we call a demand territory, 1968 where all the refineries ship their gasoline as they make it to meet current demands. So we did not include any gasoline there.

This gasoline in East Texas (indicating) moves back and forth. Sometimes it moves to the Gulf Coast and around to the Atlantic seaboard. Sometimes under certain competitive conditions it will move north.

Now, the same thing can be said for Kentucky. We did include that because that is within refining district 3. All gasoline held in that state, it isn't very much, will sometimes swing to the east and to the west, depending upon competitive conditions. It will move up into Indiana and then into Ohio, depending upon the price situation.

We included no gasoline held in the eastern half of Ohio. We did include some of the gasoline held in the western half of Ohio because that was within district 3, and that gasoline, the same as the gasoline from Kentucky, swings east and west, depending upon competitive conditions. Sometimes it will move over into Indiana; sometimes it will swing into the eastern part of Ohio.

So there is overlapping in those districts due to competitive conditions, and it is impossible to give any clear definition of gasoline stocks moved in different states as they affect the states within the district. We have done just what you would have wanted us to do under the circumstances.

1969 (Tabulation referred to marked Exhibit 841 for identification.)

The purpose of this compilation, Exhibit 841, is to show that late in February and early in March we undertook to find out the gasoline stock position of the companies which held inventories in the industry. The purpose of this was to see whether or not those stocks exceeded what we thought they should be. This includes only the companies that are defendants here, and only the area which is within the scope of this case, as I understand it.

In the 1st column there is shown the quantity of gasoline which these companies early in February estimated that they would have on hand at the close of February. At the close of February we did an unusual thing: we wrote these companies and asked them to wire us and tell us just how much gasoline they really did have.

By the inventories which we thought the companies should have I meant, fundamentally, the proper inventories for the purpose of carrying out the objectives of the refinery amendment, and those objectives were, first, to balance supply and demand; and second, to avoid concentrations of gasoline, that is, too large inventories in any territory, and third, to affect marketing conditions in such a way as to create a stabilized condition.

1970 The 2nd column indicates the replies we received from these companies telling us how much they actually had.

In the 3rd column we have shown a quantity of gasoline which it was found these companies had in excess of what we felt they should have for our purposes; or, in a few cases, the quantity which they held less than we felt they might properly have, and, at the same time, accomplish our purposes.

In the final column, the 4th column, we show the quantity of gasoline which each of these companies in response to our request voluntarily retired from manufacture in March. This last quantity that I have named, that withdrawn from manufacture voluntarily, should be related to the figure in the 3rd column which showed how much they were over. If they were over what we thought they should have, we asked them to curtail that quantity.

In the 4th column you will find the extent to which they found themselves able to comply.

The total voluntary curtailment by the defendant companies, as indicated in Exhibit 841, was 214,386 barrels of gasoline, each barrel containing 42 gallons, and that is a net figure after setting over against those who curtailed the plusses or the excesses of those who did not. In other words, that is a net accomplishment, a reduction of 214,386 barrels.

1971 Curtailing the March manufacture by 214,000 barrels in refinery districts 3 and 4 as an element in the whole situation had the effect of firming the market, which perhaps is another way of saying firming the price.

To the extent that the major companies were found with less gasoline than they needed, they were compelled to replace that quantity from some other source; the only other source was purchases.

When the majors voluntarily curtailed their own production they had to go out on the market and buy it. That was the purpose of getting them to do it. We were trying to open a gap in the market, and get the small refiners' gasoline into the market at a price.

(Tabulation previously so marked for identification is received in evidence as EXHIBIT 841.)

I also have prepared a tabulation that shows the curtailment made throughout the entire country by all the major companies to whom I sent my request.

(Tabulation showing curtailment by all majors, marked Exhibit 842 for identification.)

This compilation, Exhibit 842, shows in the first column the quantity of gasoline that each of the 23 major companies to whom we sent the wires of March 9, asking them to curtail, was authorized to make during the month of March.

1972 In the next column is shown the quantity that those companies actually made.

Now, this is not confined to the 10 states; this is over the country as a whole.

The third column shows the quantity of curtailment, or the quantity of gasoline that the companies made less than they had a right to make, over the country as a whole. That total is 965,454 barrels.

That total that I just gave is the aggregate quantity of curtailment. When I said curtailment, I meant voluntary curtailment at the request of the National Coordinator's office.

(Tabulation previously so marked for identification is received in evidence as EXHIBIT 842.)

(Chart produced by counsel is marked Exhibit 843 for identification; is displayed on an easel before the jury, and explained by the witness.)

This chart, Exhibit 843, is designed to show the condition which we faced at the time this voluntary curtailment about which we have been talking took place.

This (indicating) is March 1, 1935. On that date the gasoline stocks over the United States amounted to 64,888,000 barrels. We felt, I mean the Code Authority felt, that these stocks were too high, and that some activity should be undertaken which would result in curbing manufacture, so that on March 31 the industry would stand in a better position.

1973 Each month the Administrator, Harold L. Ickes, told the industry how much gasoline it might make. He told them how much they might make to sell, and he told them how much they might make to put into storage; and that is what he did for March, 1935. He told us we might make so many million barrels, but that of that quantity 2,940,000 barrels were to go into storage. Those who received a part of that 2,940,000 barrels were in duty bound to put that gasoline into storage. That is, that was the implied agreement when they got the allocation. However, it was understood that if conditions didn't permit them to put it into storage, they would have to supply the demand with it.

We calculated that the 2,940,000 barrels which the companies were authorized to put into storage, if put there, would run up stocks at the end of the month to 67,828,000 barrels.

We knew that that was a conservative figure because each month there was a little over-production, and possibly, if March weather conditions were the same as Feb-

ruary, there might be a disappointment in demand. If there was, as much gasoline wouldn't be consumed as we thought, and the storage figure might run up higher. We had a right only to figure that there would be 2,940,000 barrels put in storage and that we would wind up at this point (indicating), which was too high. This was the
1974 objective point that we had fixed, right down here (indicating) 66,130,000 barrels,—that was what we called our March 31 objective.

We watched the thing the first few days in March to see what was going to happen. And this is what happened. Not only did gasoline stocks show promise of mounting as rapidly as we figured they would, but they showed definite evidence of mounting very much more rapidly; so that by the 8th or 9th of March they had mounted more than we had calculated. It was right in this period here (indicating) that we took our action with respect to a voluntary curtailment.

It took some several days to get this curtailment under way. Those companies were large; their operations, of course, couldn't be adjusted over night. The American Petroleum Institute on the 16th day of March published their weekly report of gasoline stocks, and they showed those stocks at or about that figure (indicating). This indicated to us one of two things: Either the industry had gone hog-wild on manufacture, or the weather was bad and gasoline wasn't moving. We had already reached this agreement, and curtailment was in effect under the voluntary plan. This is what took place: gasoline stocks immediately began to fall, and in the last of the month they fell sharply; and by the 31st of March we had come down virtually to the objective of March 31 (indicating).

1975 This distinction should be made clear to you: This accomplishment was not entirely due to this March curtailment program. In fact, it was only half due to that. The other half of this accomplishment came about through the effect of something over which we had no control. Gasoline demand just jumped away up in March, beyond any expectations, and ran approximately 900,000 barrels above Government estimates, which are ordinarily very, very accurate. A considerable part of this saving in position, therefore, was not due to the voluntary curtailment, but a considerable part of it was.

(Chart previously so marked for identification is received in evidence as EXHIBIT 843.)

Mr. Donovan: Q. I believe you said, Mr. Shatford, that the operation of this refinery control program under the Code had the effect in forcing major companies to buy gasoline. Do you know whether or not this was the purpose for which the Refinery Amendment was enacted, one of the purposes for which it was enacted?

Mr. Lewin: Now, that is the same objection we had last week.

Mr. Chaffetz: The same question was asked two or three times.

The Witness: I answered that a minute ago, anyway.

1976 The Court: He answered it a minute ago, anyway, he says. Objection sustained. Exception allowed.

Mr. Donovan: Now, your Honor, if I may on that, at a later moment, make an offer of proof?

The Court: Yes.

(Jury not present.)

Mr. Donovan: Now, Amendment to Refinery Article of Code:

This, your Honor, is based upon certain questions that I asked in several forms, and in several manners, during the time I was asking the witness to show what the purpose of that refinery amendment was.

Now, with the same—predicated upon the same assumption as to this offer, in question and answer form, and severally and as a whole, Mr. Shatford if he were permitted to testify, would testify as follows:

In January, 1934, the independent refiners in Louisiana and Arkansas, as well as those in other parts of the Mid-Continent, were caught between a high crude oil price on the one hand and a depressed tank car market, on the other. Refiners who had any substantial investment in their plants were afraid to use crude oil produced in excess of state allowables for fear of endangering their investments by reason of violating Section 9 (c) of the N. I. 1977 R. A. The majority of small refiners outside of East Texas, therefore, paid the full price of $1.00 for legal crude oil and they were forced to sell their gasoline in competition with gasoline produced from hot oil. Hence, small refiners were forced to sell their gasoline below cost.

During the first 6 months of the Code, the inventories of gasoline increased rapidly. This had a further depressing effect upon the tank car price. This increase was partially due to the operation of Article III of the Code, which prohibited the withdrawal of crude oil without approval once it went into storage. Rather than freeze the crude supply, therefore, many refiners manufactured gasoline and put the gasoline in storage.

The Court: This witness has already testified to that very fact, haven't you?

A. Yes, your Honor.

The Court: You don't need to cover that.

Mr. Donovan: It leads up to this, your Honor:

It was also true that the Code had not helped the small refiner regain any of the market which he had lost over a period of years.

1978 Because of the condition of the small refiner in January, 1934, the Louisiana-Arkansas Association sent John E. Shatford to Washington to see if he could obtain some relief for them. Mr. Shatford saw Howard Bennette, who was a member of the Planning and Coordination Committee. Mr. Bennette agreed to attempt to persuade the Planning and Coordination Committee to recommend to the Administrator some type of refinery control. Mr. Shatford also saw other members of the Planning and Coordination Committee, including Wirt Franklin and Amos L. Beaty.

During the early part of February, 1934, Mr. Shatford saw members of the Petroleum Administrative Board and discussed with them the need for some plan under which gasoline manufacturing schedules would be adjusted so as to create a real trading condition in the industry, one in which the independent or non-integrated refinery would have a place in the picture. Those members of the Board with whom he talked recognized that over a period of time merely balancing the supply of gasoline with the demand therefor would not serve to improve the condition of the small refiner. The members of the Board stated, however, that in order to introduce any such plan, it would have to be recommended by the Planning and Coordination Committee.

1979 On February 28, 1934, the Planning and Coordination Committee passed a resolution recommending that the Administrator apply what was known as the "quotas in Commerce" provision. "Quotas in Commerce" meant that the quantities of gasoline which entered interstate commerce would be controlled.

The major companies were not anxious to have any system of refinery allocations adopted which would take out of their hands the control of their manufacturing operations. As a counter proposal, a group of majors met in New York on March 20, 1934, and signified their willingness to sign an agreement calling for a small reduction of gasoline inventories.

On March 29, 1934, the Administrator issued a call for a hearing to discuss the two proposals for refinery control. The first hearing was set for April 4th.

On April 6, 1934, the Administrator issued a draft of an amendment to the Refinery Code. In making this public, the following press release was prepared and issued,—and I would like to have marked for identification, without reading it to your Honor, the press release.

Mr. Shatford spoke at the hearing on April 4, 1934. Among other things he said—he spoke at the 1980 hearing which I have referred to, set and called for by Mr. Ickes:

> "The liquidation of inventories in this industry of excess gasoline must have at the heart and center of it the realization that a large number of the independents' outlets have been wiped out and destroyed by what you might call legitimate means under the old regime. By the purchase of independent outlets, by all of the prestige that is inherent in a big organization, that the small man cannot cope with. The spot market for gasoline is largely gone, and until it is restored the independent refiner cannot live. So, the allocation itself rests upon the prospect that the spot market will be restored.
>
> "From time immemorial the big companies have bought gasoline, but under their present plan they do not want to buy gasoline. We insist they shall buy gasoline through allocations. They claim they have all the plant capacity they need to supply all the gasoline that they require, and that they will not buy gasoline

on the spot market. If that proposition pre-
1981 vails, then we are done. We are through, and that is all there is to it, and there is not any use for talking any further, if that is to be the interpretation of this Code. If these men assert the right to manufacture all the gasoline that they use, then the independent refineries are through.

"Under the allocations plan the big company will continue as in the past to buy gasoline, and we say there is a moral obligation on him to do it, due to the fact that the Anti-Trust laws have been released to give him a chance to do as he pleases, or to do as he needs under the present situation; and we do not think that he should take advantage of that and manufacture all his gasoline and buy none.

"So, the purpose of this plan is to compel him to buy gasoline. And they very frankly say they will not do it unless they are compelled to do it."

On April 11, 1934, there was a second hearing on the proposals for refinery control. Prior to this, on April 6th, the Petroleum Administrator made public a proposal for an amendment to Article IV of the Petroleum Code. At the hearing on the
1982 11th, Axtell Byles, as spokesman for 23 major companies, stated that while the companies whom he represented did not want to surrender the control of their manufacturing operations, they would consent to a refinery control program as a contribution to stabilization.

The proposal submitted by the Administrator was not entirely acceptable and a committee was appointed by Mr. Fahy of the Petroleum Administrative Board to re-draft the amendment. This committee, consisting of Amos L. Beaty, John E. Shatford, Howard Bennette, Jules Constantin, C. E. Arnott, Fayette Dow, and Mr. Fremming, met twice with the Petroleum Administrative Board.

At these meetings the proposed amendment was discussed sentence by sentence and each question was discussed to the point of understanding. During these deliberations the objectives and purposes of the amendment were discussed. Certain major companies felt that merely balancing supply with demand would be sufficient. Those spon-

soring the amendment, however, stated that it was necessary to go farther than balancing supply with demand, that it was necessary to adjust manufacturing schedules so as to give effect to a definite policy of opening the market for the prod-
1983 uct of the small refiner. It was this view which was adopted in principle by the Petroleum Administrative Board at the hearing as the objective of the amendment. The amendment as finally drafted at the second conference in the Petroleum Administrative Board's office was the one approved by the Administrator on April 24, 1934.

Mr. Crawford: Except as testified to by the witness already, we object to the offer, and object to the testimony contained therein, on the ground it is immaterial and irrelevant.

The Court: Objection sustained. Exception allowed.

(Jury present)

Mr. Donovan: Q. Now, during the period when this Amendment was in process of adoption, had the conditions affecting the small refiner improved?

Mr. Lewin: Objected to. That is away back in the spring of 1934, and it comes absolutely outside of your Honor's ruling as to the condition of the independent refiner.

The Court: Is that '34 or '35?

Mr. Lewin: '34.

1984 The Witness: The Refinery Amendment was adopted April 24, 1934, and Colonel Donovan has asked whether there was any improvement under the administration of the Code, any improvement in the small refiner's condition.

Mr. Lewin: Your Honor, that is a year before, a full year before the period involved in this case.

Mr. Donovan: It seems to me, your Honor, if we want to show the condition in 1935, and what the situation was, just as we were permitted to show conditions leading up to the Refinery Amendment, we ought to be permitted to show what the condition of the small refiner was; because it was designed, as now appears, to aid the small refiner. Now, how are we going to know what the condition of the small refiner was—

The Court: He may answer that.

"Question: Now during the period when this Amendment was in process of adoption, had the conditions affecting the small refiner improved?"

A. During the period of adoption, you mean, during the period when it was being negotiated?

Mr. Donovan: That is right.

A. The condition of the small refiner had not improved.

1985 Q. What had become of the small refiner during that period? What was his actual condition during this period he has described?

Mr. Lewin: That is objected to.

The Court: What had become of the small refiner?

A. During the period when the refinery amendment to the Code in April, 1934, was being adopted the condition of the small refiner had not improved. During this period prior to the adoption of the Refinery Amendment in April of 1934, the small refiner was in a very difficult position, because he was having to pay $1.00 a barrel for his crude oil, and having to sell his gasoline at prices that would compete with the price being charged by those who were paying very much less than that for crude oil, those who were buying illegal production. In addition—

Mr. Chaffetz: Excuse me. I now move to strike out all the witness has said and object to any further testimony along this line.

It is now perfectly apparent that we are getting into the back door what was not permitted to come into the front door; because, all this kind of testimony, we argued for hours about, as to its admissibility, and the Court ruled it out; and we have now got a new device for going back into it. Our 1986 original objection still stands. We are dealing with the price of gasoline in 1935, and so far as allocation provisions are concerned, there is no contest here with respect to those at all. The question here isn't as to the validity or legality of those allegations. The only matter that is important here with respect to allocations is what was its collateral effect, what was its effect during 1935, during that first 3 months while allocation was in effect, during the period charged in the indictment as being covered by the alleged conspiracy.

Mr. Donovan: We have an entirely different situation now than we had before, your Honor.

It now appears, what the design and purpose of the Code authorities were; and if part of that design and purpose was to aid the small refiner and, as a means of aiding the small refiner, to force the major companies to buy, then those aids that were adopted by the National Coordinator or by the P. and C. Committee have an important bearing on this case, as to why this buying was conducted.

We simply say this, your Honor: There were
1987 other and further aids administered here to the small refiners, as bearing on the major companies. If there were such, we are entitled to show that; and in order to show that, we must make this preliminary explanation of the condition of the small refiner.

Mr. Lewin: That gets away, if your Honor please, from the objective upon which this testimony was first offered, because they offered it to show, if they could, whether it had any effect on that price rise. Now, may it please the Court, they are going into the entire rule of reason, and not only during this period of alleged conspiracy, when it is certainly of doubtful validity, but in 1934, a year before.

Mr. Donovan: Well, we want to try to show, your Honor, what was done in aid of this anticipated refinery control, what was done in aid of that by other means employed, just the same as the Refinery Control Amendment may do so.

1988 Mr. Chaffetz: I think we have allowed these witnesses to testify fully as to what the effects were in 1935. The witness was asked the broad question as to what were the facts in 1935, and now we are trying to paint a picture which we can't paint in 1935, so we go back to 1933 or 1934 in order to draw another red herring into the case.

Mr. Donovan: I certainly object to this talk of red herrings, your Honor.

The Court: Yes.

Mr. Donovan: We will offer definite proof, and I think these gentlemen should be admonished now to not characterize our honest efforts here to establish our theory of this case.

Mr. Lewin: We feel, your Honor, sincerely, that this effort is improper and doesn't follow under your Honor's ruling. It is like the conservation point,—

The Court: I said you could establish by the offer of what proof you had, to show what factors existed in '35 and '36 did not exist prior to that time. I think you had better confine your testimony to that.

Your motion to strike out is granted. Exception allowed.

Mr. Donovan: Your Honor, may we have the jury instructed about this red herring once and for all?

The Court: Yes. Pay no attention to those remarks about drawing a red herring across the trail. You just listen to the evidence and pay no attention to any statement that counsel might make, until the proper time comes. Unless you are 1989 told to, just listen to the evidence, and you will decide this case upon that and upon the instructions of the Court, and not upon questions or remarks of counsel on either side.

Mr. Donovan: Q. Was anything done in May, 1934, to aid what you believed would be the effect of the refinery control system?

Mr. Lewin: That is objected to as leading. It calls for a Yes or No answer.

Mr. Chaffetz: I have no objection, your Honor, if he asked, was there any other factor in 1935 that was supplementing the refinery control system; but what was done in May, 1934, can't have any effect, as I say, on the issues in this case, and we object to it on that ground.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, I would like to make an offer of proof on that.

The Court: I want this witness to tell the jury everything that occurred in—all the factors that entered into the price of 1935 and 1936 that did not exist in 1934 and 1933. And I think he has covered that the other day very well.

Mr. Donovan: Q. Was there anything more, Mr. Shatford, that you now have in mind that was done to aid or supplement this refinery control program?

Mr. Chaffetz: That is objected to. That is the same question, leaving out the date.

1990 Mr. Donovan: I am only following out the suggestion of the Court. I don't think that there is anything leading about it.

Mr. Chaffetz: That is not the question the Court put.

The Witness: (To the Court) I think the thought is that in 1934 we undertook a buying program that failed. I think the purpose is to show what was lacking in 1934 that was necessary to make the buying program succeed. I think that is what he is trying to do.

Mr. Chaffetz: If we go into that subject, we are going very far afield. We are going to deal with controversial matters that are going to take a great deal of testimony; and, as we contend, can't show what the effects were on price in 1935 and 1936.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, if I may, before we go any further I would like to make these offers of proof now, if we could.

The Court: All right. The jury may retire.

(Whereupon the jury left the court room, and the following proceedings were had out of the hearing and presence of the jury.)

(During the argument before the Court the following statements of counsel were made:)

Mr. Donovan: Now, if it please the Court, I was just thinking as Mr. Chaffetz was making his argument, that every time we make an offer of proof directed to a specific thing here, where Mr. Chaffetz thinks it may hurt the contention of the Government, we are led off into a long discussion of what is not presently before your Honor now. 1991

But on that, let me say finally what I have said many times: We claim that what was done by us did not come within the provisions of this section of the Code to which he refers, just as Mr. Francis has said. I have said repeatedly, your Honor, that we are not coming in here and claiming exemptions or immunity to that section. We say what we did was right and proper, and we will undertake to show the circumstances under which the governmental bodies had knowledge of what we did and what they did in relation to that. That is perfectly simple.

Mr. Dorr: Now, "approval" may mean a whole lot of things. It may mean when the President signs an act; until he has signed his name to that law as it comes through Congress you cannot properly say he has approved that act of Congress, in one sense of approval; but if that is the kind of measures which he regards as proper, and has said is proper, and is in line with what he says is an objective, then in that sense there has been approval, and approval for a long time. We are dealing with a word, your Honor, that has different meanings.

Now, in the sense that Secretary Ickes before any buying was done, of the P. A. B. before any buying was done, sat down and wrote something equivalent to signing a law on this, of course there never was and we do not so contend. And so far
1992 as the doing of that act would be necessary to give us immunity from the Sherman Act, there never was anything of that kind in my conception of it.

Mr. Chaffetz: There is no question pending that I know of, your Honor.

The Court: No, but I am going to find out something for my own information.

Q. What did this Petroleum Administrative Board do? What were its functions?

The Witness: Do you mean officially or actually?

The Court: Both.

A. Officially, they were appointed to advise and assist the Administrator. In practical effect, this is what took place: We could not see the Administrator except at very rare intervals. We had matters coming up every day; and so we dealt almost exclusively with individual members of the Petroleum Administrative Board because they, too, were not only busy with their own affairs but were shot all over the United States; and so we had to deal sometimes with 1 or 2 or 3 members of the 6-man board—sometimes 4 members.

And in order to facilitate the business we were doing with them, they specialized the duties of each of these members of the Petroleum Administrative Board, and we made contact with them. We would explain our problem, what we wanted to do. They,

in turn, would take it up with the sitting members, that is, the members in Washington at the time. And they would confer and decide; and if it were
1993 a matter requiring the Administrator's approval, they would prepare for the Administrator an order, all written out, with a place to sign, and they would carry it over to his desk; and somebody, if they thought it necessary, would go and explain it to him and tell him what it meant; and if he thought it wise, he would sign it. And that signature about describes his participation, in most of these decisions, unless they involved an important matter of policy. I think that is a perfectly fair statement of what took place.

Mr. Donovan: Q. In answer to the Court's question, Mr. Shatford, were there instances such as you have described, in this curtailment, where there was no formal order and Mr. Fahy communicated to you that fact?

A. Time without number, your Honor. Everybody was running around carrying water in his hat, trying to put out the fire. We didn't know what the law was; we didn't know what the rules were. We were just doing the best we could under the circumstances, and trying to get under cover every way we could, in what we did, meeting one emergency after another. And in a practical effect, we took hold of the Government's hand every time we could.

Mr. Lewin: Q. What do you mean by "covered up?"

A. I would say we intended to get, where there was any doubt—and there was doubt on everything, nothing was certain—and where there was doubt we would want to feel that the Government, the
1994 governmental authorities, felt that they would bless the thing and say, "Go ahead, and do this." And when they did that, we felt that we had the law and the necessary authority to go ahead and do it. It was the only way we had to act.

Q. You are speaking now of the allocations?

A. I am speaking of purchasing programs; and, your Honor, in connection with that matter of purchases—buying programs, there seems to be an important question as to whether or not this one should have been approved under the refiners' section of the Code. I don't know; I am not a lawyer, but if I were going to find out and try to make up my mind intelligently, I would like to know what kind of buying programs we did get approved; and I know what kind we got approved, and then compare it.

The Court: Q. Tell me what you did to get it approved.

A. Well, in the first place, in May, 1934, we undertook the first buying program, so to speak. It was a mere shadow of a buying program. It consisted of a resolution, which I personally introduced to the Planning and Coordination Committee, asking certain of the major companies to buy a quantity of gasoline in May, equal to 3% of their sales.

Now, this undertaking, of course, failed.

Then in June we undertook what was called the 1995 Bennette buying program. The outstanding characteristic of that program was this: that we adopted what was called a standard form of contract; and under that contract the purchasing companies agreed to take a certain quantity of gasoline, providing the selling companies would agree to abide by the Code and rules and regulations, and so forth, and by their allocations.

That program was formalized to a greater extent than any other had been; and so we felt that because of this uniform type of contract and because we set up an office in East Texas where we brought the buyer and the seller together and helped to carry on the negotiations as to price and quantity and issued definite quotas to the buying companies and determined exactly how much there would be to sell—because of that degree of formalizing, we felt it necessary to get approval under the Code.

Let me point out one thing: Under the code it says this, that we should get approval for buying arrangements, where the arrangements provided for the purchase and resale of gasoline. Now, we threw that interpretation out of the window. We got approval of the buying program where there was no resale of gasoline.

The reason the Code was worded that way was this: That at the time that amendment was passed, they had in view only the National Agency Agreement, which was proposed in the late winter of 1933.

1996 It was a buying pool calling for the—a pool of $10,000,000 to be paid in by the major companies. They had to buy gasoline and store it in a definite place physically, and later ship it, export it, perhaps, do what they wanted with it, and resell it out of the pool. That was the buying program, the type of buying arrangement that they had in mind when the language of the code was drawn, the buying and reselling. But because of the fact that this formalized the last Bennette program, we felt we should get approval. We did get approval for the Bennette program.

Then, in August, we went a step further. An organization was called the France program. It was called the France program because Jacob France was the chairman of the committee.

Mr. Chaffetz: That was Jacob France, one of the defendants in this case?

The Witness: Yes. And under that plan, we had the formalized program, but we went a step further. We established offices all over the country. One in Tulsa; one in East Texas. And we established, I think, one in Chicago; one all over the country. And we went the limit. We brought the buyer and seller together and talked price and all that sort of thing.

Mr. Lewin: Did you have a program committee for that work?

The Witness: We had a program committee, a 1997 very elaborate affair, a very elaborate failure.

Mr. Lewin: Did it work under the Arnott letter of July, 1934?

The Witness: No. It operated under Section 6, Article 4. It was a failure. And that was approved by the Administrator.

Then we tried to revive that under what was called the Horween plan, the Horween program, which was an attempt to renew the France buying program. It was under the same authority, using the same forms, with the exception of two alterations which were made in the contracts. But it was highly formalized, and we requested approval of that program. There were certain outstanding characteristics of all these programs that we had approved:

First, there was a uniform type of contract which the buyer and seller were negotiating. In them were certain provisions respecting compliance with special provisions in the refinery amendment of the Code. There were offices and agencies. There was a consideration of price, which was practically everything involved in the way of formalization except the pooling arrangement where you take the gasoline and distribute it.

In these arrangements we would let A buy from A and B from B, in other words bought from a purchaser of their own. But otherwise it had all the characteristics of that pool. This buying program that is under
1998 discussion here is something else. I don't know what it is.

Mr. Lewin: Would you tell his Honor about the Beaty Suggestion, the one Mr. Beaty suggested be approved in the fall of 1934? There was another one that was handed to the Secretary for his approval, and the Secretary didn't approve of it. Will you tell us about that?

The Witness: I did, Mr. Lewin. That is the Horween program.

Mr. Lewin: No, there is another one.

The Witness: Oh, yes. I will go back—

Mr. Chaffetz: The one that was mentioned to the Secretary—

The Witness: When we started the Horween program, objection was made to the fact that the program didn't work out in the way the Administrator had expected it would when he approved it. That is, he had felt that only a small quantity of gasoline in East Texas would be bought under these contracts which he had approved, but the practical effect of it was this was what happened—the price was above the market, so the refiners down there were very happy to dump all their gasoline in the laps of this committee and say, "here, at that price, take it all," which they did. So in effect these buyers were signing this for the practical side of it.

1999 The Court: Who was furnishing the money?

The Witness: The major companies who bought the gasoline.

Mr. Chaffetz: Who pointed out that objection that you just referred to?

The Witness: You mean within my personal knowledge?

Mr. Lewin: Your general knowledge. I take it you are giving your general knowledge?

Mr. Chaffetz: You don't have personal knowledge in all of these things?

The Witness: No. More or less general in most cases.

Mr. Lewin: Who pointed out the objection to the Horween plan?

The Witness: Mr. Secretary Ickes—Mr. Horween just told the members of the program committee that the contents of the program was objectionable and asked us to stand by until the Administrator could reach Dallas. The Administrator reached Dallas. Now, as I understand it, he issued a statement in the paper which I wouldn't attempt to quote, but Mr. Horween was our contact man, and he was the executive assistant to the Administrator. He was the man whom we had negotiated with when we got the program adopted, because I was the one who negotiated with him and the 2000 Secretary, myself, and heard the Secretary's approval of the program. And Mr. Horween went to Texas under definite instructions to do this thing.

Then when this objection was voiced to the Administrator and he gave this statement to the paper, we stood by. Mr. Horween told us, the program committee, that he had orders that we were to stand by. We immediately undertook to meet the objections that were made. We held a meeting, and we tried to cure our contract—

The Court: You know about when that was?

The Witness: Yes, sir, that was on November 12, 1934. We met at the Baker Hotel in Dallas. We tried to work out certain changes in the contract to avoid the abuses that were complained of. We worked those out, and they were submitted to the Planning and Coordination Committee. The Planning and Coordination Committee submitted them to the Administrator, and the Administrator advised us that he had sent them to the Department of Justice. He advised Judge Beaty of that, and Judge Beaty advised the Planning and Coordination Committee and we stood by in the full expectation and assurance that we were to go ahead if and when the Department of Justice blessed the new idea.

Mr. Chaffetz: Which it never did?

The Witness: So far as I know, they never did.

Mr. Chaffetz: And then these buying programs 2001 started without any blessing from anybody? Is that right?

(No response.)

Mr. Lewin: Would you tell his Honor, Mr. Shatford—

Mr. Thomas: Is this cross examination, now?

The Court: I want to get the general picture. I think I have got it. Wait a moment. I can see—can you see any good reason why this jury shouldn't have the benefit of this statement this man (indicating the witness) has made?

Mr. Chaffetz: We think so. We think it is entirely confusing, and one of the results — talking about the kind of argument to the jury—this is one of the results of that kind of argument to the jury, "We did exactly what the Government did." That is the argument they made when this case started.

The Court: He said if the program had failed.

The Witness: That is correct.

Mr. Chaffetz: Under entirely different conditions, your Honor.

The Court: I thought this: If we could give them a thumbnail sketch, without too much detail, then you can come to the point where the Government ceased to handle it and left them where they were, and from that time anything they did was a violation of the law. But I really do think that a little 2002 history of that wouldn't be amiss and wouldn't be confusing here. I was afraid you might get away off into a thousand tributaries that would leave the jury up in the air.

Mr. Chaffetz: I am not satisfied with the witness' thumbnail sketches. We couldn't stop there. We would have to show all the factors. We would like to show how the first one was changed into the form of the second; we would like to show how the France buying program was repudiated by the Secretary of the Interior.

The Court: Q. Is this witness ready now to make an honest and frank statement, and perhaps can clear up what he has in mind?

The Witness: I moved every buying program before the Planning and Coordination Committee that was had.

The Court: I think we can, without going into too many offshoots—

Mr. Chaffetz: We have discovered in this case that if they start with a thumbnail sketch that they then get down into the controversy of whether or not allocation was done in cooperation with the Government—

Mr. Lewin: To help the independent refiners, we even got into.

Mr. Crawford: I think, if the Court please, that 2003 is the first time where I have seen a situation where the Court was considering, really considering admitting into the record testimony which is immaterial and irrelevant and incompetent, for the purpose of giving the other side an opportunity to base an argument on it. And I hope that I will not see it here.

The Court: Well, I said this—at least, I wanted to convey the idea that, while it is irrelevant and immaterial, I suggested to you, would you have any objection to its going in? That is all I had in mind, and that is the last thing I said.

Mr. Crawford: Well, I am sorry if my two colleagues have not already made it plain to your Honor, that we consider it very questionable and very prejudicial.

The Court: Well, I know—I thought they might relent. There is no question in my mind that it is immaterial and irrelevant, but it is somewhat helpful to me in understanding this whole situation, and I thought it might be helpful to the jury. Well, you have made your objection, and the objection is sustained. But I still think it might have been helpful to the jury. Exception allowed.

Mr. Donovan: Your Honor, then may I include this statement made by the witness in answer to your Honor's and other questions, as a formal offer of proof?

2004 The Court: Yes, you may.

Mr. Donovan: Together with the exhibits that I will have marked? It may save us time.

Mr. Chaffetz: In view of the fact that Government counsel asked some questions of the witness, I would like the record to show that we did not ask all of the questions we would have asked had we cross examined the witness.

Mr. Crawford: We have no objection to this testimony taking the form of an offer of proof. That is about what you want, isn't it?

Mr. Donovan: That is what I want, with the addition of one question.

Q. Mr. Shatford, you have characterized this as the Horween program, and I would like to ask you if you know whether there was ever any formal order entered, withdrawing that program, any written order of Secretary Ickes withdrawing that program?

A. No, sir.

Q. There was not?

A. There was not.

The Court: What the witness has said is your offer of proof, to be considered a part of it?

Mr. Donovan: Yes, included in our offer of proof, yes, sir.

The Court: To which objection is made?

2005 Mr. Lewin: To which objection is made.

The Court: Because it is irrelevant, incompetent and immaterial?

Mr. Lewin: Irrelevant, incompetent and immaterial.

The Court: On that offer of proof, the objection of the Government is sustained. Exception allowed.

I do think, however, there can be no objection to this witness outlining the way in which the Petroleum Administration Board operated with his board, and how he operated with them.

Mr. Lewin: We haven't challenged the allocations; they are in now. And they can take those allocations as a basis for argument that that caused that price rise. Isn't that all there is?

The Court: Well, we will wait until after you have written up this witness' testimony, and I think at the outset, he said something about how he conducted this Petroleum Administrative Board.

Mr. Beaty: May we have an understanding with counsel that what the witness refers to as the Horween program was the proposed revival of the France program?

Mr. Chaffetz: That is right.

Mr. Beaty: That goes in the record, in connection with the offer?

2006 Mr. Chaffetz: That is right.

The Court: Have you any further offer of proof?

Mr. Donovan: Yes, we have, your Honor. I just want to get these straight, now.

I would like to have marked for identification, in connection with the offer of proof through the witness, a certified copy of an order dated November 2, 1934, signed by Harold L. Ickes, together with the document attached thereto, which is a form of contract with order attached, under date of September 8, 1934.

(Document produced by counsel was marked Exhibit 844 for identification.)

Mr. Donovan: Also, certified copy of an order dated June 23, 1934, signed by Harold L. Ickes, together with the document attached thereto, being form of contract for the purchase of gasoline relating to the accumulated storage of excess gasoline.

(Document produced by counsel is marked Exhibit 845 for identification.)

Mr. Donovan: Also certified copy of an order dated September 8, 1934, signed by Harold L. Ickes, together with the documents attached thereto, as follows:

Exhibit A, being a form of purchase agreement;

And Exhibit B, being a form of contract for the sale of gasoline.

(Document produced by counsel is marked Exhibit 846 for identification.)

2007 Mr. Donovan: Also certified copy of an order dated August 13, 1934, signed by Harold L. Ickes, together with the document attached thereto, being a form of agreement under a so-called order or promulgation of a standard form of contract for the purchase of excess stocks of gasoline.

(Document produced by counsel is marked Exhibit No. 847 for identification and made a part of this offer of proof.)

Mr. Donovan: It is understood, your Honor, that these are marked for identification in connection with the offer of proof made as to what this witness would testify, and based upon the examination of the witness here, and are offered as a part of the offer of proof?

Mr. Chaffetz: Over the objection of the Government; and the objection of the Government, I understand, is sustained?

The Court: Yes. Exception allowed.

Mr. Francis: Your Honor, I have mentioned the matter once before, and I don't think it is necessary to mention it again, but I think it goes along with this record, that we offer each one of these separate statements in our general offer, as separate and distinct from the whole; we offer the whole, and each separate part thereof as a part of the offer, and you object to it all?

2008 Mr. Chaffetz: That is right.

Mr. Francis: I want to get the distinction that we are offering each and every part, separate and individual and apart from all the balance, so that it is not just one whole general offer, but it is a several offer.

The Court: That is the Court's understanding.

Mr. Donovan: I want to have this marked for identification, as part of the last offer of proof I made, which is a certified copy of a press release numbered 83,317, dated April 6, 1934, issued by the Department of the Interior.

The Court: It may be marked for identification, as a part of the offer.

> (Document produced by counsel is marked Exhibit 848 for identification.)

Mr. Donovan: In addition to the offer of proof made to the court based upon the questions and answers to questions directed by the court to the witness, Mr. Shatford, in addition, if permitted to testify would testify as follows:

That under the France program the program committee determined the prices at which contracts would be negotiated. These prices were arbitrary and were in all cases 1¢ or more above the prevailing tank car quotations.

2009 In addition the program made hot oil regulations more difficult of enforcement, because where under the program the buying started out in taking up excess gasoline from the market, it actually undertook to buy all the gasoline.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, I only have two more offers now:

> Proposal of Petroleum Administrative Board to Have Refiners Hold Products for a Minimum Price.

And this is offered under the same conditions that have just been referred to by Mr. Francis, separately and as a whole, and in question and answer form:

If John E. Shatford were permitted to testify, he would testify as follows:

On August 27, 1934, a group of independent refiners met in Kansas City, and discussed means of relieving the situation in which they found themselves.

The discussion on the subject was crystallized into a telegram which was sent to the Administrator on August 27, 1934. As a result of this telegram, Mr. O'Shaughnessy was invited to come to Washington to meet with the Petroleum Administrative Board concerning the subject. On August 30, Mr. 2010 O'Shaughnessy accompanied by Mr. Shatford, went to the Petroleum Administrative Board and had a conference with its members.

At that meeting, the Petroleum Administrative Board, through Mr. Margold, its chairman, proposed to Mr. O'Shaughnessy and to Mr. Shatford that the refiners meet and determine how much gasoline they would have available for sale from time to time, and that they agree to withhold this gasoline from the market until such time as it could be sold on a cost recovery basis. The Board was asked whether it would be necessary to draw and execute a formal agreement for administrative approval. Mr. O'Shaughnessy and Mr. Shatford were assured that this would not be necessary. They then asked the Board whether or not such an informal arrangement would be in violation of the Sherman Anti-Trust law, and they were assured that this was not so; that they would be protected by the rules of the Code.

A detailed and extended discussion was had of the merits of the plan, and all of the influences and effects were considered quite carefully, after which Mr. O'Shaughnessy returned to Chicago for the purpose of submitting this suggestion to his associates. After discussing it with them, it was agreed that the plan was not workable, due to the threat of en- 2011 croachment of gasoline from other refining districts, which might result in even more serious dislocation of the market.

Mr. Crawford: We object to that as immaterial, irrelevant and incompetent.

The Court: Objection sustained. Exception allowed.

(Jury present)

By the Court

I did not regard my position as a government position. Under the Petroleum Code of Fair Competition I was a member of the Planning and Coordination Committee, which was known as the Code Authority. In addition to that I was National Coordinator under that Code, which position embraced the duties of administrative head of the refinery amendment or refinery section of the Code.

In the performance of my duties I had more or less contact with the Petroleum Administrative Board. The Petroleum Administrative Board was a Board consisting at the outset of 6 men appointed by Administrator Harold L. Ickes, to advise and assist him, and in that connection he assigned to that Board certain administrative duties, routine more or less, and then additional duties with which they were called upon to procure special approvals and that sort of thing.

As the coordinator, in contacting the Petroleum Administrative Board, I customarily saw Mr. E. B. Swanson first on almost any subject. 2012 He had been designated by the Petroleum Administrative Board as the member whom we should contact in connection with refinery matters. He also had production matters under his supervision. Then from that point we would go to perhaps a meeting of 2 or 3 members of the Petroleum Administrative Board, and finally, if it were convenient or expedient, we would go before the whole Board..

I might add that as a practical matter, the members of this Board were frequently, in fact, some of them usually, out of the City of Washington carrying on their duties in connection with their then special work for the committee or for the Board. Under those circumstances, there would be only 2 or 3 members sitting in Washington, and in those cases, we were compelled to contact and deal with just those who were there.

My duties as coordinator were to administer the rules and regulations that were set out in the refinery amendment of the Code, in connection with the making of allocations, and carrying on the other provisions of that section.

The Court: I think that covers it.

Mr. Donovan: Your Honor, would your Honor ask his direct contact, if any, with the Administrator? Would you include that in your question, whether or not he had direct contacts with the Administrator?

2013 The Court: Q. You may answer that. Did you? A. At very infrequent intervals we could get to Administrator Ickes himself, but ordinarily our matters were carried to him by members of his board, ready for his signature.

Mr. Donovan: May I have this chart marked for identification?

(Chart referred to marked Exhibit 849 for identification.)

Mr. Donovan: Q. I show you chart, Exhibit 849 for identification, purporting to show the market as reported in the Journal of Commerce and the Oilgram for the months of October, November and December, 1934, and ask if you can tell us the influences at work on that price rise as disclosed by that chart in October, November and December?

Mr. Lewin: For what year?

Mr. Donovan: 1934.

Mr. Lewin: We object to it.

Mr. Donovan: Your Honor has already said we might deal with the questions arising from October and November, 1934.

Mr. Chaffetz: Your Honor, for the reasons we just argued a few moments ago—and your Honor sustained our objection—we think that is objectionable.

Mr. Lewin: That is 1934. That is right in line
2014 with your Honor's suggestion.

The Court: I want this witness to testify as to the factors that entered into the price rise in 1935.

Mr. Donovan: Yes, and I think if he should do this it will have a strong bearing in exemplifying what happened in 1935. I am limiting it strictly within 3 months.

Mr. Lewin: Your Honor, it will open up all that question that we debated to your Honor.

The Court: I think it will.

Mr. Chaffetz: It will make two controversies instead of one. We will have a controversy on this price rise in addition to the price rise on the other.

The Court: Yes.

Mr. Donovan: Well, let me ask one question, and if your Honor feels I should not ask it I will not.

Q. Was there a Federal Tender Board set up on or about October 14, 1934?

Mr. Lewin: That is distinctly leading, and right within your Honor's ruling. They have attempted time and time again to go into that subject, a Tender Board in 1934. The Tender Board that is important is the Tender Board under the Connally Act. Your Honor has consistently ruled on that, and here is another attempt to go into the next question.

2015 Mr. Thomas: We are going back 3 months. One of the important questions in this case of course is: What was the cause of the rise in March, 1935? We have the Connally Act as one of the elements that the witnesses have mentioned in their testimony. We have here the Federal Tender Board.

We want to show, and I think we have the right to show, what effect restrictions such as the Connally Act had upon production, or what effect the Tender Boards had upon the price. I think it is material for that reason.

Mr. Dorr: Now, what we are doing here is to take one of their fluctuations which they have shown, and which I have compared with the subsequent season, and explain why that fluctuation took place. I think that is sufficient, but there is an additional ground on which I think we should be allowed to do this, and that is this:

That here we have operating at this time the introduction of a new factor in the price situation, in the market situation, just as we have the introduction of a new factor at the end of February. We want to show, and I think we are entitled to show, that that factor, the Federal Tender Board, when it was introduced in October, 1934, produced the same kind of effect that it produced when it was introduced in 1935, namely, the factor of the Government 2016 control of hot oil. Your Honor will remember that control came in effectively in October, 1934, went out when the Supreme Court threw it out, and came back again in March.

In both cases it tended to produce, and it was a strong contributing factor in producing a rise in price, and that rise in price was commented upon again and again before this jury.

Mr. Donovan: They offered no proof to show what caused it, but they wanted to leave the inference to be drawn here by these gentlemen, that, because there was a rise here, and that was different than other years, that therefore this was the result of some nefarious agreement—

Mr. Lewin: That isn't it at all.

Mr. Donovan: And we objected at that time, your Honor, upon the ground that they did not show comparable conditions, and it was for that reason that your Honor permitted us to show what factors were at work, which were different here, than were in other years.

Now, what we are trying to do is simply to show that, when you have the same kind of thing in 1934 as you have in 1935, as Mr. Dorr has said, the same result occurs. And that was due to the action of the
2017 Government itself, and not to any action on the part of these defendants.

The Court: We are concerned here with what affected the market in 1935 and 1936.

Now, as I said before, if there are any factors that entered into the market trend in 1935 that did not exist prior to January 1, 1935, why, you may prove that; and I think you have gone into that very thoroughly; and that is as far as you ought to go. If you go into this, we will be here until Doomsday. I don't think it is material. I have outlined the kind of proof I think you are entitled to offer, and I think you should be confined to that.

Mr. Donovan: Then do I understand, your Honor, that the objection to the testimony of this witness is sustained?

The Court: Yes. Exception allowed.

Mr. Donovan: And we may make an offer on that particular subject?

The Court: Yes.

(Following occurred in the absence of the jury):

Mr. Donovan: Your Honor, I would like to make this offer of proof that I asked to make yesterday, in relation to the October price rise. I assume that it may be considered that this is in question and answer form.

2018 The Court: Yes.

Mr. Donovan: And it refers to each one specifically as well as generally.

The Court: Yes.

Mr. Donovan: If John E. Shatford were permitted to testify he would testify as follows:

From the middle of October, 1934, to November 6 or 7, 1934, the published quotations for the tank car price of third grade gasoline, Oklahoma market, Group 3, increased 1½¢. There was an identical increase in the published quotations for the same market on the same grade of gasoline in the spring of 1935. Instead of occurring in 3 weeks, however, the increase occurring in 1935 took 3 months—from the first week of March to the first week of June.

The increase in October and November of 1934 was largely due to the establishment of the Federal Tender Board on October 25, and its subsequent operations. For months the market had been flooded with cheap gasoline manufactured from "hot oil." The Petroleum Administration had attempted to stop the flow of hot oil but no efforts, prior to the establishment of the Tender Board, were effective. The Tender Board gave promise of being the instrumentality which would cut off the supply of hot oil, and, from the day it was approved, majors expressed a willingness to reenter the market. The government 2019 also promised to prosecute violators.

The result was a quick upswing in price to a better level.

Mr. Chaffetz: We object to that offer on the grounds already stated.

The Court: Objection sustained. Exception allowed.

(The jury returned to the jury box.)

Mr. Donovan: May it please the court, I offer in evidence Exhibit 834 which I have already submitted to your Honor, and which your Honor said that I might submit at a later time. (Handing exhibit to the court.)

The Court: Have you seen this?

Mr. Chaffetz: Yes, we have, your Honor, and we think the objection to it is apparent upon its face. It opens up the same issues we discussed yesterday, and we do not think it is proper.

The Court: Objection sustained. I think it is included in what you covered yesterday. Exception allowed.

(The following proceedings were had in the presence of the jury.)

Mr. Donovan: I should have offered that chart, Exhibit 849, in evidence—

2020 The Court: Yes.

Mr. Lewin: We object to the chart, on the same grounds. We object to it as being incompetent, irrelevant, immaterial, outside of the scope of the issues in this case, and having no bearing whatever on the issues before this jury.

Mr. Donovan: Certainly he can't object to the chart, your Honor, as a chart, when they have their own chart—

Mr. Lewin: We object to it as a chart, because it is incomplete and partial; because it singles out one particular month in 1934—there are a host of other objections.

Mr. Donovan: If you see it correctly, there are three months there, Mr. Lewin.

Mr. Lewin: Two months, then.

The Court: Objection sustained.

Mr. Donovan: October, November and December. That objection is sustained?

The Court: Yes. Exception allowed.

Mr. Donovan: Mr. Hale, what is the number of this chart (referring to a Government exhibit)?

The Witness: 712, Colonel.

Mr. Donovan: 712? All right.

(Witness refers to Exhibit 712.)

From the 1st of March to June 1, 1935, third grade
2021 gasoline advanced from 3¼¢ to 4¾¢, which would be
a 1½¢ per gallon advance.

Prior to March 1, we had two prices for crude oil. We had a $1.00 price which was charged for oil that was legally produced. That was called the posted market price. Then we had a second price. That price was anything from perhaps 20¢ or 25¢ to as much as 40¢ a barrel.

I am disregarding the talk about stolen oil, because at this point there wasn't enough of that to make any difference.

While there were two prices for crude oil, there was only one price for gasoline. That price for gasoline in tank cars, f.o.b. refineries in East Texas in substantial quantities was at a level which reflected the cost of this illegal or low-priced crude oil. After March 1st the Connally Act went into effect, and in connection with the Connally Act there was set up in East Texas what was known as the Federal Tender Board, and it was the duty of that Board to see that no crude oil or any of its products that were produced or manufactured in excess of the state allowables fixed by the Railroad Commission of that state were to be permitted to enter interstate commerce, that is, leave the State of Texas.

The prices in East Texas and in Group 3, or Tulsa, Oklahoma, are competitive, and to the extent that they differ,
it is only a very small fraction of a cent, and that
2022 difference depends, if there is any difference, frequently upon the direction in which it is shipped. For all practical purposes, the prices are competitive. When you refer to the price of one, you refer to the price of the other. This describes the advance in the price of gasoline as quoted in the official journals, representing the market upon which the gasoline is traded in.

Mr. Lewin: May I ask whether the testimony of the witness is that the factors affecting the East Texas market also affect directly the Oklahoma market?

A. Because the gasolines go to a common market.

Mr. Lewin: That is your testimony, that that is so?

A. That is my testimony.

When this Tender Board was set up, after March 1, this flow of crude oil and gasoline stopped. Following that, there was only one price for crude oil, and that was the $1.00 price, insofar as interstate commerce was concerned. There was only one price for crude oil, and therefore, there very rapidly came to be only one price for gasoline, because the man who paid $1.00 for crude oil had to sell it on a cost recovery basis or deliberately lose money.

When that change came about, this rise began, and it appeared to be an irresistible thing, because the pressure
which had held the price down had been removed, and
2023 the price of gasoline irresistibly started to go up, and found its parity in the proper cost of raw material.

Mr. Chaffetz: We object to the last statement because it is a discussion of the factors.

Mr. Donovan: It is a statement of fact.

The Court: I think you better state what the facts are. Exception allowed.

A. (Addressing the Court) You mean you don't want me to state the effect of these things, only state they existed?

Mr. Chaffetz: Describe what the facts are.

The Court: You know whether or not there was a buying program down here during that period by reason of the major companies—

A. When is my knowledge—at what period is that question effective?

The Court: Now, any time. You are trying to tell us what the factors were that entered into this trend of prices?

A. Yes.

Q. Are you taking into consideration whether or not there was, as the Government contends, a buying program?

A. I am taking into consideration, your Honor, the whole question of demand—

Mr. Crawford: I don't think that is an answer, 2024 your Honor.

A. I just want to make an answer to his question and say this, that a buying program would be an element of demand.

The Court: That is what you said the other day?

A. Yes.

Mr. Lewin: You didn't answer his Honor's question as to whether you knew there was a buying program working there. I say that is a thing he must know before he can enter into a conclusive explanation of that—

The Court: He knows there was a Connally Act.

Mr. Lewin: Yes.

The Court: What else do you know that went into the factors that affected that price? You don't have to refer to the chart here. In 1935.

A factor that affected price was low inventories. The inventories in the hands of the buying companies were so low that I firmly believe, if the demand of March, April, May and June had been just as we had estimated it would be, these companies would have felt the pinch of low gasoline stocks, but that is not what happened.

In the month of March, demand exceeded estimated demand by approximately 900,000 barrels, and in April, May, and June, demand in each of those months approached record-breaking levels, and when I say "record-breaking," I mean reached levels which approached the highest 2025 for those same months in the history of the industry.

Mr. Chaffetz: That is for the United States as a whole?

A. That is for the United States as a whole, yes, sir.

In the month of March, we had taken away from the inventories of these major companies, over the country as a whole, approximately 960,000 barrels of gasoline. In early February, when we gave gasoline allocations to them, we had made the best estimates we could of what the demand would be in the month of March, but we couldn't foresee and didn't foresee that actual demand would exceed our estimates about 900,000 barrels. But it did. So in the month of March, these companies were caught short not only the 965,000 barrels which we curtailed them but an additional 900,000 barrels by which demand exceeded estimates. This goes to the question of the effect of this increasing demand under the circumstances. Had we been doing business outside of the Code, the industry could have met this surge of demand by increasing its refining operations.

Each month we estimated how much gasoline the refineries might be permitted to make, and that schedule of manufacturing was based on their estimates of demand. In the month of March our estimates, made in early February, were 900,000 barrels too low. In
2026 addition to that is the 965,000 barrels we curtailed.
There is 1,865,000 barrels of gasoline that the majors were caught short by March.

On March 13 we met and made allocations, based on estimates for the 1st of April. When we met on March 13, we had no way of knowing that the month of March was going to show this increase of 900,000 barrels in demand, nor was there any account taken at that time of the volume of curtailment. So in our allocations for the month of April we proved to be approximately 800,000 barrels too low, because in April the demand exceeded the estimates by that quantity. And so that 800,000 barrels needs to be added to the 1,865,000 barrels, so that it gives a total approaching 2,750,000 barrels of gasoline by which the major companies were short at the end of April over the entire country.

In April when we met to handle the May situation, we had learned of this increase of demand in March and we knew of our curtailment in March. It is only proper to point out that when we met in April to fix the May quotas, we did very largely take into account the March situation. But we did not take into account the fact that in May estimates of demand would be approximately 2,000,000 barrels below what the demand actually was.

By rough calculation, by the end of May, the companies had been caught short approximately 3,000,000 barrels—

Mr. Lewin: Q. You mean in their inventories?

2027 A. They were caught short that much gasoline, whichever way you view it. They were caught short 3,000,000 barrels of gasoline that they would have had with which to meet demand.

When a major company faces the question of meeting demand, it has two hands. It can take gasoline here, from its current manufacture; or it can take it from its inventory; or it can buy the gasoline on the market.

In this situation, the major companies faced the need to find 3,000,000 barrels of gasoline somewhere. They were short that much, on account of this increase in demand.

Now, 3,000,000 barrels of gasoline is about—well, perhaps I had better not make that comparison—

Mr. Chaffetz: No, go ahead. About how many tank cars, were you going to say?

It amounts to about 15,000 tank cars of gasoline, which is about equal to the quantity of gasoline, I believe, that was purchased according to the record here, as I understand it, during the first several months of the buying program.

I might add that throughout the year 1935 there was a demand in excess of expectations or estimates, of about 20,000,000 barrels of gasoline. Now, a great deal of that excess demand was due to an increase in exports which began in about June. I think prior to June, 1935, exports had been perhaps a little bit below normal, or
2028 a litle bit lower than the previous year; but in June
there was a sudden increase in exports of gasoline, and at that point a good deal of additional gasoline was required for that purpose.

I should say that the gasoline demand in the Middle West was about in direct proportion to the rest of the country, after subtracting the increase due to an increase of exports.

Q. Would you say—

Mr. Chaffetz: If the witness doesn't know—he said, "I should say"—if he doesn't know, I would rather that that be stricken.

The Court: Q. Would you say it would be 10%, 15%, 50% or 90%?

A. I think the actual increase over the country as a whole, if I remember the figures correctly—and I am only quoting the figures from memory, and it is a long time back—were between 6% and 7%, during the year.

The Court: Q. Let me put it this way: From the information you have, can you tell us what percentage of the gasoline produced in this country is consumed in the Mid-Western section, in these 10 states?

A. Oh, I would say perhaps 20% to 25%. It
might be a little more than that. Now, your Honor,
2029 if I attempt to sum this thing up, I am afraid I
will get into argument. I will just give the factors
as I see them.

There was the Connally Act, which stopped the flow of illegal and cheap product into the market. There was the March curtailment, which came at a very critical time.

Then there was this sudden increase in the demand for gasoline, which ran approximately 3,000,000 barrels over a period of 3 or 4 months, in addition to what we had estimated, which demand the refinery was not permitted to meet on account of refinery control. In other words, the industry was under hobbles.

And I think that those factors—leaving out of consideration the factors that you gentlemen know, probably better than I do, with respect to general recovery and that sort of thing—these are the factors which I think, directly connected with oil, directly within the industry itself, made an especial contribution to this rise in price.

Mr. Donovan: Q. Now, Mr. Shatford, I direct your attention to the level line on that chart from June through December. I wonder if you can tell us what influences were at work which may have caused that level line?

Mr. Chaffetz: Object to that, unless it is shown that the witness is an expert with respect to the alleged buying programs during that period.

2030 Mr. Lewin: And he must be an expert with re-
spect to those price recommendations of Jacobi's
committee and all the rest of the tremendous
amount of evidence that is in this case. And yet
he has given you three factors here, and not once
has he mentioned that factor, the buying program,
as even having an iota of influence.

The Witness: Your Honor, I thought I covered the buying program under the general heading of demand. It was part of demand. I can't assess the relative value of that particular demand as against the demand as a whole. For instance, I can't assess the relative value between buying and export. If I could do that, I would.

Mr. Chaffetz: I stand on my objection to this witness testifying as to what the factors were that entered into that level price during that period, unless he is first qualified as an expert in buying programs.

Mr. Donovan: Your Honor—

The Witness: Well, I am no expert on the buying program.

Mr. Chaffetz: You are not?

The Witness: No, sir.

Mr. Chaffetz: All right. On that basis—

The Court: Objection sustained. Exception allowed.

2031 Mr. Lewin: Now, we move to strike all that long answer, then, as coming from a man who is totally incompetent to talk on any such subject.

The Court: We will let the jury give what weight they think his testimony is entitled to.

Mr. Chaffetz: I have an objection now that I didn't think of before. I want to know what this witness was, what his business was during that period of the latter half of 1935.

Mr. Donovan: I object to any further cross-examination of this witness at this time, your Honor.

Mr. Chaffetz: No, that is as a basis for the assertion that he wasn't in intimate contact with the factors affecting price during that period.

The Witness: I think, your Honor, it is fair for me to say that after August, right here (indicating), right after that period right in there (indicating), I ceased having any direct or active connection with any Code work, and my business at that time and since was tank cars, leasing them to refineries. And I was a little bit in the position that a football player is, that had been called to the side lines. I could see the game, but I just couldn't feel it like I could before, so I don't know—

Mr. Donovan: Q. But you saw it, nevertheless?

A. Well, I could see some of what was going on.

2032 Mr. Donovan: Then, your Honor, may I ask him this question:

Q. Were you familiar with the factors that were at work during that period, some of the factors?

A. Yes; sir.

Q. Now, may I ask you the question again: What were those factors with which you were familiar?

In the first place, the same old Connally Act was for the first time giving effective control respecting the quantity of crude oil that was coming into the market.

Under proration, the valve, you might say, which opened and closed, and let more or less crude oil on to the market from month to month, was not in the hands of the industry. It was in the hands of the state governments, who had these regulatory laws. And so they, accepting in some cases, and always considering the recommendations of the Bureau of Mines, each month, would open or close the valve and admit to the market just as much or just as little crude oil as it appeared, from expert estimates, would be needed to meet the demand for gasoline.

The allowances respecting crude oil were based on the requirements of crude oil to make the necessary gasoline that was needed in the national market, and for exports, and so on. That nice control was going on during this period for the first time. And so they would open and close this valve to meet or offset or compensate for 2033 any of the influences which under ordinary conditions, assuming there were no proration, would have had a tendency to influence the price of crude oil up or down.

For that reason and for other reasons too we had a stable price, or a level price for crude oil.

It is true the price of crude oil had been level before this time, but that was due to different influences, arbitrary influences under the Code. During the period June-December, 1935, we had a situation where we had a real economic control.

The extent to which that control was effective can be shown much better than just by merely stating that it was so, by pointing out to you that during 1935 the industry withdrew from storage approximately 25,000,000 barrels of crude oil, reduced its stocks that much in order to meet an unexpected demand for gasoline of approximately 18,000,000 barrels—without any repercussions at all being felt in the market of crude oil as to price.

Under ordinary conditions of doing business, I believe it is a fair statement to make that that important shift in the conditions of crude oil stocks in the industry, and that major shift in the manufacturing schedules of the industry, in making 18,000,000 barrels more gasoline, or 20,000,000 more, than we had expected to, would have had a very strong effect on the price. It would have had a very bullish effect, and would have had a tendency to lift the price 2034 of crude oil.

Under the influence in part, at least, and certainly a very important part, of proration, the price situation in the industry survived that shock, and showed absolutely no effect of that major operation which ordinarily would have caused a severe price change.

That level condition of the crude price we might call a floor; we might say that that acted somewhat as a floor under this price of gasoline here, this tank car price.

In former years there had always been a relationship in a general way between the price of gasoline and the price of crude oil. It was not any such relationship as we have here (indicating), not at all, because, in former years the relationship had been a natural relationship. That is, the crude oil market would feel the repercussion of a low gasoline price, and vice versa. It would take some time. There would be a lag, but in a general way one price would follow the other.

But here, June to December, 1935, we had an artificial floor built under this price (indicating), absolutely level. And, as we had a new condition affecting the price of crude, we found a new effect in the price of gasoline. There that price of gasoline sat, just as the crude price sat. That might go on, and still we might have a fluctuation. We might have a level price of crude and still, as I see it, we might have a fluctuating tank car price here (indicat-2035 ing), providing we had the usual violent disturbances that take place normally in the retail markets.

In this period we are discussing now, from May to the end of 1935, we had an unusual situation there; and I will call that, for the moment, the ceiling above this tank car price (indicating). During that period, the retail prices for gasoline averaged, fluctuated, I think, not more than ½¢ a gallon. That is a very, very small fluctuation in a retail price structure. Here was an unusually firm retail market price situation; underneath, here (indicating), an absolutely firm proration administration; giving us a firm price for crude oil. In between those two prices sat your tank car gasoline price (indicating).

I think it is perhaps pressing the point just a little bit too much to say that, so long as those remained reasonably level, this crude oil price and the retail price, that that would fix or freeze that tank car price (indicating). I think that presses the thing too far, but the fact is that it did stay in that relationship. It was like all other prices that year for petroleum products; all of them stayed that way, not just this price. When I say all of them, that is a generality, and is subject to exception.

The price of crude advanced early in January, 1936. I think it advanced 10¢ in the Mid-Continent field; and 15¢ in East Texas, or the other way around. I forget which it was. The first companies to post the advance were 2036 Carter Oil Company, which is a subsidiary of the Standard Oil of New Jersey, in the Mid-Continent field; and the Sun Company was the first company to post it in East Texas. There was a little company, I think the Liberty, or somebody, that posted it the day before the Sun did in East Texas. Neither one of those is a defendant.

Q. Now, what effect did this increased price of crude have upon the tank car gasoline market?

Mr. Chaffetz: That is objected to. There is a lot of testimony here, by persons who were directly concerned with the situation, as to that price rise; and this witness here was off in another business, leasing tank cars, at that time. I think there is some limit—

The Court: Objection sustained. Exception allowed.

Mr. Donovan: I ask to have a certified copy of a letter dated August 23, 1935, to Mr. John E. Shatford, marked for identification.

(Document produced by counsel is marked Exhibit 850 for identification.)

Mr. Donovan: Q. I show you certified copy of a letter dated August 23, 1935, addressed to you, Mr. John E. Shatford, under signature of Harold L. Ickes, and ask you if you received that letter from Mr. Ickes?

A. I did.

2037 The Court: If he wants to come up here and testify, he may, but I don't think you ought to put it in in this way.

Mr. Donovan: But this is a statement signed by Mr. Ickes, your Honor.

The Court: I know, but if they want to cross-examine Mr. Ickes and put him on the witness stand, that is another thing.

Mr. Lewin: We will withdraw our objection.

The Court: All right. I don't think it is material, but it may go in.

(Document, previously so marked for identification, is received in evidence as EXHIBIT 850 and read to the jury.)

By Mr. Francis.

I testified about sending out certain telegrams to certain named companies on March 9, 1935. In response to these telegrams, I received certain replies.

(A document was marked Exhibit 851 for identification.)

Document marked for identification Exhibit No. 851 is not addressed to the party who sent the wire, but is an answer to it. It is addressed to Mr. Fred Van Covern, who, I am sure, was chairman of the Statistical Sub-committee of the Planning & Coordination Committee, and finally chairman of the Inventory Sub-committee.

Mr. Francis: I offer EXHIBIT 851 in evidence.

Mr. Lewin: We object to it, your Honor, as just a 2038 self-serving statement of The Pure Oil Company, as pure hearsay, and the counsel has rested as regards C. B. Watson and Dawes (handing Exhibit 851 for identification to the Court.)

Mr. Francis: Well, I offer this for the company.

Mr. Lewin: I might add, your Honor, to those grounds of objection: First, that it is hearsay; second, that it is self-serving; third, that it has not been authenticated.

I don't raise the question of the best evidence rule, but I don't think it is authenticated. It is a telegram, evidently by a man named Watson, to a man named Van Covern. I don't know whether it is authentic—

The Court: Objection overruled.

Mr. Chaffetz: May I state another objection, your Honor? The further objection that the Government has no opportunity at all to cross-examine as to the facts contained in that telegram, and it is offered for the facts contained. This isn't a question of the ultimate result of curtailment that the witness knows about; this is offered for the facts stated in there; a telegram written by the defendant, offered by the defendant, without giving the

Government any chance to cross-examine anybody as to the truth of the facts stated therein.

Mr. Kirkland: I thought the Court had ruled.

The Court: I think I will just reserve ruling on that, Mr. Francis.

2039 Mr. Francis: Your Honor, I would rather have an exception, in view of the objection made by Government counsel.

The Court: Objection sustained, and there won't be any further discussion on it.

Mr. Francis: All right. Note an exception.

It is my understanding that after the Schechter decision in May 1935, the Department of the Interior, through the Bureau of Mines, did not continue to make estimates of gasoline demand by the several districts and certify those out as official Government information.

At the close of the Code they stopped sending the gasoline figures out by districts, and resumed it again on January 1, 1936. I offer that as a statement made to me very recently by a man in the Government service. Between May 1935 and January 1, 1936, the national consumptive demand was certified and sent out although not broken down by districts. After May of 1935 the national consumptive demand was estimated and figured by the Government and given out to the industry as official information, and then after January 1, 1936, that total figure was broken down by districts.

I was familiar with what happened in the meetings in the districts where the districts' shares of the national consumptive demand were parcelled out among the several individual refiners in each district. The District Allocators were directed, in general, to distribute their 2040 quotas to the several refiners in their districts, fundamentally in compliance with the rules and regulations that affected this distribution.

Those rules were applicable, with different emphasis, in each district.

The Oklahoma district was District 4.

In general outline, and I think within the frame-work of all the rules there are specific rules that might seem to contradict this policy, but as the rules applied in their entirety to District 4, we had this situation: We had two types of operators in that district. One was the demand operator, who sold his gasoline as he made it, from day to day, largely on the spot market, and to some extent on the contract market. Then we had the integrated or inventory company, who carried stocks of gasoline.

There was rather a natural contest in District 4, in these meetings, to see which type of company would get the larger portion, relatively speaking, of the gasoline.

So far as the National Coordinator's office was concerned, we stressed, laid emphasis on the need to give rather special consideration to the requirements of the small refiner; for the reason that if he were cut too low in his operations, his business was on an uneconomic basis. In other words, he couldn't go below a certain output per month and live. We wanted to be perfectly sure that he was kept up to an economic level of operations; that is, one that would permit him, in the first
2041 place, to make enough gasoline to make his operation an economic one; and in the second place, to have enough gasoline to sell on the open market actively.

The converse of that proposition is that the large company should have enough gasoline to carry on its business in a proper and convenient way, and at the same time be on the low side of self-sufficiency, so they would have to buy a little gasoline.

By Mr. Horween

I would say that the Globe refineries are non-integrated refineries. I pass over the word "independent" because I don't think it has any significance. A non-integrated refiner doesn't carry stocks as a rule. He more or less sells continuously as he produces his gasoline. I did not send a letter on March 1 or a telegram on March 9 to the Globe Companies, along with the other companies I sent them to, because they are a non-integrated refiner, and a non-integrated refiner does not carry gasoline stocks, and we were sending telegrams to companies who did carry gasoline stocks.

2042 *Cross-Examination by Mr. Chaffetz.*

I would say that the Globe Company gasoline stocks, and I describe them as a type, would be one thing one day, and another thing the next. They carry all of the stocks that any other refinery would carry, in relation to their operations, except one, and that is seasonal stocks. They have tank bottoms, and they have shipping stocks, enough gasoline on hand to take care of their current business in the event of a breakdown or a short strike or something of that kind; they want enough gasoline on hand, but they don't build up gasoline inventories on a seasonal basis. That is the principal distinction between one type and the other. They don't literally have to market each day the amount of oil produced that day. That isn't true of any refiner, from today to tomorrow; but the rough expression, "from day to day" or "from hand to mouth," is used.

I don't believe the Globe Company could store 30 days of gasoline, unless they cleaned out some crude tanks and put it in the crude tanks. That is my best judgment. I would say that a maximum for the Globe would be maybe 15 or 20 days, but I don't pretend to know. I only pretend to characterize them as a type that does not carry seasonal stocks.

2043 I think the Globe was possibly in a little bit better position with respect to needing to sell its gasoline as it made it than many another smaller plant. Generally, Globe Company is in the class of the refiner who does not store gasoline in advance of the current consumption.

Q. That is right. They all store gasoline; but the integrated companies, as I understand it, build up an excessive storage during the off season to take care of their seasonal requirements?

A. I think that is true, as a generalization, but we must not get away from the fact that there are many smaller refiners who do literally make their gasoline on Monday, treat it on Tuesday, settle it out and ship it on Wednesday. I know that because I did that for a good many years.

I should say that every defendant oil company is in the seasonal inventory type, except The Globe. They have what we call seasonal build-up of inventories.

Q. Referring to the independent refiners again: Did I correctly understand your direct testimony to be that each of them runs through its stills every month the same quantity of crude oil, month by month, throughout the year?

A. You mean, are they level operations?

2044 Q. Yes, that is right—running the same amount of crude through their stills.

A. I would say that would be rather an ideal condition. They are subject to so many vicissitudes I don't think any of them quite accomplishes that.

Q. I thought you said they had certain crude connections and had to run all the crude that came. I thought you gave the impression it was necessary to keep the crude running, day by day, month by month, during the year, or a certain amount of crude continuously running. If that is not the impression you intended to give, I would like to know it.

A. I didn't want to apply the point in that way. I made that point in connection with losing crude oil connections in this sense. If the small refiner shut his plant down and gave up his crude connections, someone else would step in and take it, and then when he wanted his crude oil back, he could not get it. He would be without a supply of raw material.

Q. But he does have a certain amount of leeway in his operations so that he can operate more one month and less the following month?

A. You are speaking under the refinery amend-
2045 ment?

Q. Oh, no, normal operations.

A. Yes, I should say that he can do about as he pleases.

There has been a fluctuation in the operations of individual independents, so-called independent refineries, throughout their history, so far as I know. Under the refinery amendment they were given no minimum limit. They didn't have to make the gasoline that was awarded to them, but they were not permitted to make more than was awarded to them. I think within reasonable limits it is true that the amount that these independent refiners did produce, from month to month, varied through the year.

In the spring of 1935 when the unprecedented consumer demand developed we did not abandon the allocation system under the refinery amendment. That unprecedented demand continued in April and May of 1935. But we still found it necessary to continue to allocate production to the various refiners. There isn't any question that they could have produced enough to meet that demand. They could have produced more than enough gasoline with their existing facilities.

I officially became National Coordinator on March 25, 1935, and continued in that capacity until May 28, which was the date that the Code ceased to operate and
2046 my authority was lost. I understood that I had no authority to continue thereafter, and I didn't continue.

As National Coordinator I was employed, not by the Government, but by the P. and C. Committee, which was the industry Code Authority.

The industry paid the expenses of the Code Authority through a system of assessments, I believe, made on all companies in the industry. They were not paid out of the treasury of the United States. My expenses were paid by the Planning and Coordination Committee, from industry funds and not from Government funds. As National Coordinator I drew a salary of $18,000 a year. That was paid to me from March 25, 1935, until the expiration of the Code, and it was paid out of the industry fund.

Before me, Mr. Bennette was National Coordinator. Mr. Bennette drew a salary at the rate of $25,000 a year. A few months after he took the position of National Coordinator he found that he could not spend very much time in Washington, and so the Committee arranged to pay him at that rate for the days that he was there. For the days that he was not there, he got nothing.

I assisted Mr. Bennette part of the time he was Coordinator. For the first 5½ months I worked for nothing. Then Judge Beaty, who was chairman of the Planning and Coordination Committee, discovered that fact and insisted that I be paid on the days when Bennette was 2047 not in Washington. When he was in Washington I got nothing.

Mr. Arnott was not a member of any allocation committee, nor was Mr. Carnes. I think Mr. Hartmann was not. I know C. D. Robinson of the Republic very well. He was not a member of any allocation committee. I know Mr. Neil Buckley. He was not a member of any allocation committee.

During 1934 and 1935 the period of the operation of the refinery amendment, we almost constantly overproduced. That is, every month the actual amount of production was in excess of the amount that we had intended to allocate as the probable consumer demand. The total production throughout the period was in excess of the total amount predicted as the probable consumer demand. In some months that excess was substantial.

The March, 1935 voluntary curtailment program began some time during the middle of the month, not at the beginning of the month. I think there is no exact date on which it took effect. The major oil companies curtailed just as rapidly as they could shift their operations, I should say beginning about the 11th or 12th of March.

That voluntary curtailment plan did not apply only to the major oil companies which I named. We applied it to the major companies specifically, but so that there would be not even the appearance of inequity about the thing, feeling that we should apply pressure to all alike, we
2048 urged the allocating agencies to persuade the small
refiner not to take advantage of the efforts the major companies were making by overrunning their allowables.

This list is the one I prepared of the names of the individuals to whom I sent those wires of March 9, asking them to cooperate in the voluntary curtailment. Dan J. Moran is president of the Continental Oil Company. Robert McDowell is vice-president in charge of sales of Mid-Continent Petroleum Company. R. G. H. van der Woude is one of the officials, I think president of the Shell Union. I would not attempt to say whether Shell Union is the holding company that owns the stock of the Shell Petroleum Corporation. I know H. R. Gallagher very well. He is president of Consolidated, and I am sure, president of Sinclair Refining Company, too. W. G. Skelly is president of the Skelly Oil Company. C. E. Arnott is vice-president of Socony-Vacuum. K. R. Kingsbury was president of the Standard Oil Company of California, a company not a defendant in this case. E. G. Seubert is president of the Standard Oil Company of Indiana. Walter C. Teagle was president of the Standard Oil Company of New Jersey at that time, a company not a defendant in this case. W. T. Holliday is president of Standard of Ohio. I think J. Howard Pew is president of the Sun Company. W. S. S. Rodgers is president of The Texas Company. E. L. Shea is president of Tide Water. C. B. Watson
is vice-president of The Pure Oil Company; I think
2049 he is executive vice-president.

I sent those wires to those men because I thought that they were the men to whom that matter should be directed.

The companies to whom I sent the wires of March 9 were companies that normally, in the winter season, built up large inventories to take care of the succeeding summer demand. At the beginning of the spring season, in March so far as I know, each of these companies had sufficient gasoline to meet all of its current demands.

There was not a shortage of gasoline as to current demands, except in this sense. I think this explanation is required at this point. So far as an integrated company, or an inventory company, we will express it, is concerned, their requirements for seasonal purposes are almost as important to them as their day to day requirements are. In fact, in one sense they are perhaps a little more important, because if they were a little short today, so far as their current requirements are concerned, they might turn and buy, but they might not want to use their inventory and take a chance on being able to buy 4 or 5 months later. So that in that sense their inventories are almost as separate a thing as if they didn't have gasoline.

Q. It is a question of policy as to each company, to which extent they will draw on inventory, and to what extent they will buy?

2050 A. I believe the word "necessity" is a better word than "policy." Building up a seasonal inventory is a necessity. For instance, it isn't a policy in the sense that they could suddenly decide they didn't want to build up an inventory.

Q. I started to state this hypothetical case: One of these defendant major oil companies purchasing, we will say—

Mr. Francis: Just a minute. He has started on a different line. I want to object to any statement of a hypothetical case, as to which there are no facts in this case.

The Court: Objection overruled, exception allowed.

Mr. Chaffetz: Q. Let us take the Standard Oil of Indiana. Assume, if you will, that the record shows that the Standard of Indiana purchased 75 cars in March. Would you say that that indicated that the Standard of Indiana, as a matter of necessity, bought that 75 cars rather than to draw that 75 cars from its storage throughout the country?

A. I would say that the purchase of 75 cars of gasoline a month on the part of the Standard of Indiana would signify nothing as to their necessity.

2051 Q. The quantity is insignificant, isn't it, 75 cars for a company as large as the Standard of Indiana?

A. I would say so. In my judgment. Now, my judgment may be wrong.

Q. And similarly as to other defendant major oil companies?

A. No, I don't want to answer that.

Mr. Donovan: I object to that. It doesn't appear what the situation is, how much they purchased.

Mr. Chaffetz: Q. Assume, if you will, that the Shell Company purchased from 40 to 50 cars a month in the Mid-Continent area, would you gather from that that it was a matter of necessity?

Mr. Donovan: I object to that. An assumption, your Honor.

The Court: Overruled. Exception allowed.

Mr. Donovan: This question is directed to a certain assumption, which doesn't appear as a matter of fact, and the witness' opinion is asked upon that assumption.

Mr. Chaffetz: I am directing myself, your Honor, to the testimony that was adduced on direct, and the purpose for which the testimony was adduced—it
2052 is perfectly evident they were trying to show that the purchases made by the defendants in the so-called buying pools, were purchases made to meet their needs—and this was general testimony—to meet their needs brought about by these voluntary curtailments, and it was sought to bring out by this witness the fact as to each and every company, because there was no distinction made.

Now, I am trying to bring out that this witness is not qualified to show—was not qualified on direct examination to make that broad statement. And I am now making on this examination, by reference to the testimony in this record as to what each of these companies did buy during that period.

The Court: You may proceed.

A. I would like to say, your Honor, that Mr. Chaffetz' description of my testimony isn't entirely accurate. I said that the buying program was one of the factors.

By Mr. Chaffetz

Assuming that the consumer demand increased very sharply in March, we were not, as a practical matter, free to increase the allocations of these companies in April.

In the first place, we had nothing to do with the de-
2053 termination of the national manufacturing schedule.

That was done by the Government, by the Petroleum Administrative Board, assisted by the Bureau of Mines. That was entirely out of our control.

The P. & C. Committee did not each month recommend a figure for the national allowable to the Department of Interior. We, the P. & C. Committee, sometimes did, and that was when we felt that the market situation or the inventory situation was in a critical phase. Then we would deal with them. But we always felt diffident about it, because we felt it was a trespass upon the government's prerogatives. They were supposed to do it.

Members of my committee and members of the P. & C. Committee did consult with the P. A. B. from time to time about what the estimates should be. The refinery amendment provides for consultation at the offices of the Petroleum Administrative Board. Sometimes they consulted that office and sometimes they did not. The Interior Department relied, I am sure, on the Bureau of Mines' determination as to demand from time to time. Those determinations were not forthcoming within the period necessary to give effect within 30 days to an increase in demand. Now, I make that statement as a generality.

Q. That is right. But in any event, each of those
companies as you say did maintain substantial in-
ventories, generally speaking, to take care of just
2054 that situation, where there was an unprecedented or
unexpected increase in consumer demand; isn't that
true?

A. Their operations were budgeted, Mr. Chaffetz, depending on a forecast, and they used about the same factors in making their forecast that the Department did. I would assume that their errors in estimates would be about alike.

Q. And of course, being a private company, they could change their budget or their plans on any day in the month, any given day they saw fit; isn't that true?

A. You say their budget and plans. They could change their budget, but that would be only a paper change, unless they would change their operation.

They could decide to withdraw 50 cars from inventory on any day if they wanted to, subsequent to the first of 1935, and when I say they could do that, I am disposing of the question of legality, and I am just asking you to assume that this compliance all the way through they insisted was voluntary and it was on that basis that they did it.

Subsequent to January 1, 1935, they were bound by a di-
vision of their allocations, so much of it for inven-
2055 tory, and so much of it for demand. Now, it was pro-
vided that if they found that current demand was
greater than was estimated they could make application to
withdraw a part of that from inventory, or transfer it to
current manufacture to meet such a situation, if and when
they saw fit.

If they put gasoline into their inventories because their current sales were less than their current production, that would reflect a decline in demand and would leave their inventories too high at the end of the month, and penalize them the following month. They would be cut off that much in their right to manufacture. So they met that situation as a rule, I think, as nearly as they could, by curtailing their operation.

I would not qualify as being familiar with the way in which each of the defendant companies does business in the Standard of Indiana territory, but I know that a large quantity of gasoline is sold in this territory through jobbers and service stations. Each of the major companies does business through its own outlets and to some extent they sell to independent dealers also. The major companies do not sell on the spot market to any substantial extent. Generally speaking, I know that jobber contracts in the Indiana territory have basic price provisions which are determined by reference to the market journals. In a 2056 general way I know also that the price to the dealer shall be determined by reference to the retail price at which gasoline is sold. I understand, in a general way, that jobbers doing business with dealers do business in the same way that major companies do when they deal directly with dealers, that is, they use a dealer form of contract. I know also that the defendant major oil companies together sell the greater part of all gasoline that is sold in the Indiana territory. I cannot say that the defendant companies sold more than 85% of the gasoline sold in the Indiana territory in 1935 and 1936 without looking it up. In that general way I could say they sell a substantial part of the gasoline sold in the Mid-West. I think it would be unfair for me to attempt to name a percentage. I should say that they sell much more than one-half.

There are some other majors doing business in the Indiana territory. The Sun Company does business in Michigan. They do not get in the rest of the territory. The National has its chief distribution in this territory.

I cannot say whether the only other companies doing business in this territory are the small independent refiners to whom I referred in my direct testimony. Off-hand, I can't think of any other company that does business here.

I would want to think about that a great deal more.

2057 In a general way, I know that many of the independent refiners that I referred to sell gasoline to jobbers, and some through their own outlets in this territory under contracts.

Q. They do business in much the same way that the major companies do, in a general way?

A. You mean with reference to making contracts with jobbers?

Q. That is right, and with reference to selling through their own outlets?

A. I think they sell some in a competitive way.

Some of the refiners in and around Oklahoma sell some gasoline to jobbers in the Standard of Indiana territory on the spot market. That is in addition to the gasoline that such refiners sell here under contract to jobbers.

And in times past independent refiners in East Texas have sold gasoline in the Indiana territory on the spot market and not under contract. They have been in and out of this market.

Pretty largely all the gasoline that is sold in this territory on the spot market is sold by the independent refiners, either in the Mid-Continent territory or in East Texas.

Of course a little comes up from Kentucky, not very 2058 much; and perhaps a little from Southern Illinois. Some comes out of Michigan.

In any jobber contract which is based on the spot market the price of the gasoline sold under that contract would necessarily be influenced by spot market transactions between the refiners and the buyers, whoever they might be.

Q. The only substantial spot markets that you know of that could determine those prices are the spot markets in Oklahoma and East Texas?

A. I would say that is the principal spot market.

Q. Yes. Do you know also that during 1935 and 1936, the retail prices posted by the Standard Oil Company of Indiana as the price leader bore some relation to the published spot market prices?

A. Well, I can't state that specifically. I can't answer that question specifically.

I think I said in my testimony that there was a relationship between the two that had always prevailed. I had knowledge in a general way that, during that period of 1935 and the early part of 1936, it was the policy of Standard of Indiana, in fixing its retail prices, to base its normal retail prices on a fixed level above the prevailing spot market tank car prices.

Q. Yes. So that, if that was the policy of the 2059 Standard of Indiana, and if the Standard of Indiana did fix the retail prices as price leader; then, if the spot market prices remained uniform during that period, you would expect the retail prices generally to remain uniform similarly, wouldn't you?

A. To the extent that their policy affected the market, I would answer that yes. I would think their policy had some effect on the market.

Q. Don't you know that they are the price leader in this territory?

A. They might lead a price down, but I don't think they could lead it up.

Q. Well, now, don't you know as a matter of history, over the period 1935 and 1936, that the Standard of Indiana was the price leader in the retail price field?

A. I think in—I don't know just what the definition of "price leader" is. You say it has been used in this case. If it is defined, I will be glad to answer the question.

Q. Have you ever heard the term "price leader" before?

A. Yes, in this sense: The Standard Oil Company of Indiana is the largest marketer of gaso-
2060 line; it is the largest single influence in the market. Now, if that establishes the Standard Oil Company of Indiana as the price leader, then I think that is what they are.

Q. Now, and you know also that usually its posted prices are followed by all the other companies in the same territory?

A. I couldn't say yes to that, under competitive conditions in the retail markets.

Q. Now, I think we have come to this point, then: That the prices for gasoline in this territory, whether in sales to jobbers or in sales to dealers, or in sales through major company owned retail outlets to consumers—the prices are determined by the spot market transactions between independent refiners, largely in Oklahoma and East Texas, and jobbers in this territory. Is that a fair deduction from your testimony?

A. There are other factors, it seems to me, that might influence the price; but I think that is an influence, of course.

Mr. Chaffetz: Q. That is the major influence, isn't it?

A. Well, it is an important influence.

Q. Well, isn't it the device whereby those prices

2061 are normally determined, or were normally determined during the period, 1935 and 1936?

A. I would say that theoretically that is the way the thing would work; but competitive conditions often upset that pretty badly, and the relationship that you have described doesn't exist at all.

That those jobber contracts specifically provided that the basic prices paid by the jobber shall be the prices published as the spot market prices is true to an extent. To what extent, I don't know. A great many of the contracts so provide. It is typical.

The price paid by the jobber under contracts containing that provision would fluctuate with the spot market.

Q. Yes, under those contracts. All right. And assuming that the retail price bore a standard or a standing relationship with the spot market price as published in the trade journals, then the retail price would depend on fluctuations in the spot market; isn't that true?

Mr. Donovan: Just a moment, Mr. Shatford. I must object again, your Honor. Here are hypothetical questions, here are assumptions put to this witness; there is no statement here that there 2062 is any such testimony in the record. I should think that we had gone far enough on ifs and assumptions, your Honor.

Mr. Kirkland: All I want to say, your Honor, is just this: I am afraid we are getting away from the original objection.

What I object to is that counsel in his question assumes, or at least would give the inference to any person sitting in the jury box, or to your Honor, that Standard just arbitrarily raised that price, any time they wanted to; and that isn't the proof in this case. And I am willing to stipulate with the Government as to what Standard actually did, if they want to.

The Court: The witness gave a long discourse yesterday on the prices of gasoline, and I think counsel should be permitted to find out just how much he does know.

Mr. Chaffetz: It may be important to know that he didn't know some of these factors.

The Court: Go ahead. Exception allowed.

Mr. Chaffetz: Q. I was about to suggest, Mr.

Shatford, that the retail prices prevailing in the Standard of Indiana territory during 1935 and 1936 were based on the spot market, in view of the
2063 policy of the market leader, to vary its retail prices as the spot market varied, and ask you whether you didn't know that to be a fact?

A. I would say that was only a factor, Mr. Chaffetz. I don't think there was such an absolute control of the thing as your question implies. My judgment would be there wasn't. I can only have a judgment on that question.

Q. That is right. You don't know, do you, that during this period the retail prices did, in fact, fluctuate directly with the spot market prices, subject only to a slight lag each time the spot market price changed?

A. I think there was a very definite relationship between them during this period.

Q. Yes. So that you would say that the retail price did vary during this period with the spot market price?

A. In a general way it did, yes.

In cases in which those contracts provided for that, the price to the jobbers varied with the spot market prices. In cases where gasoline was sold to jobbers on the spot market, that is also true.

Q. Yes. So that you would say that the principal factor, at least, that governed prices in the
2064 Standard of Indiana territory was the spot market price of gasoline during the period in question?

A. My judgment is it was an important factor.

I wouldn't say it was the most important factor. I think there were, perhaps, other stabilizing influences on retail prices, but as far as the mechanics of the price is concerned, insofar as there is a mechanical relationship between the tank car price of gasoline and the retail price, the situation you describe was an important factor. As far as the mechanical relationship is concerned, it was the most important factor. Insofar as the contracts were concerned, it was the most important factor, because that is what the contract was.

Q. Insofar as the retail price, that would be the same?

A. To the extent that took place, that would be a factor, yes, sir.

The sales on the spot market in the Mid-Continent and East Texas fields were made almost entirely by independent refiners or by non-integrated refiners. In fact, I know that to be a fact.

Q. As I remember, the spot market prices, as published in the journals—they must have published the
2065 spot market prices of the independent refiners, isn't that true, since they were the only ones that sold on the spot market, according to your testimony?

A. I said that by far the larger part of the spot sales were made by independent refiners and the Journal did publish the prices, as I understand, at which these independents refiners sold to jobbers.

Q. The price at which the independent refiners sold on the spot market necessarily made the spot market; isn't that right?

A. That is the spot market which is generally used, I understand, by the trade journals in making up the spot market quotations.

Q. And it is the only spot market the independent refiners could use, because they are the only ones that sold on the spot market?

A. Yes.

The spot price which is made by transactions between small refiners and jobbers and brokers makes up the spot market published in the journals, and in many cases, in fact in a very large part of the business, the selling, or rather the marginal contracts, are based upon that spot price, and during the period in question here, 1935 and 1936, the retail price was tied to the spot market.
2066 That was the method used in establishing the normal market price.

In the mechanics of determining the normal prices of gasoline in the Standard of Indiana territory you look to see the prices that the independent refiners in the Mid-Continent and East Texas fields get in their spot sales.

Without any question, there would be a relationship between the price received by the independent refiner for his gasoline in tank cars and the normal retail price.

Q. That is right, and I thought we had gone beyond that. I thought your testimony was that virtually the only factor that determines the prevailing prices in the Indiana territory, looking at it from the standpoint of the mechanics, as you put it, is the spot market business of the independent refiners.

A. That is, between the independent refiner, the broker and the jobber, and normal markets, there is the relationship, and that is a very, very large factor, and probably the most important one.

Q. Yes.

A. That theoretical structure.

Q. And so with the sales to the jobber; the jobber 2067 contracts, as you have testified here, based directly on the spot market.

A. Many of them do.

In those circumstances, if I wanted to determine what the factors were that during 1935 and 1936 produced the levels of prices that prevailed in the Standard of Indiana territory, the factors that determined the prices received by the independent refiners in their spot sales would be one very important consideration.

I would look first, I think, however, to the condition of the retail prices themselves as to whether or not they were normal. If retail prices were normal, then I think you might expect to find quite a definite relationship between the retail price and the tank car price, not in toto, but be a very large factor.

There would be a relationship between the general level of retail prices and the spot market, whether the retail prices were normal or abnormal, if the practice was to fix the normal price in relation to the tank car price. It might be a varying relationship, depending upon the degree of subnormality of retail price, but there would be some relationship if you established averages, without any question.

There certainly never was a time after March, 1935, and in 1936, when the entire retail market was subnormal. I don't suppose there has ever been a time when the whole market was subnormal.

2068 I think the general level of prices in theory is of course dependent upon the market price structure. There may be conditions in short periods in which the general level of prices is below that desirable level.

Q. But you would first have to have that normal level to know what the trend of prices is going to be. I can make myself perhaps a little clearer. If the policy of the market leaders in a theoretical situation was to fix retail price, the normal retail price, at 6¢ above the spot market price, we will say, then your subnormal condition would relate to that 6¢ margin over the tank car price, wouldn't it?

A. If you undertake to describe that as subnormal, that would be the inference.

Q. That is, it is the test of what is subnormal?

A. I think so.

Q. It is below the level fixed as the normal retail price?

A. Yes, if you use that as a theoretical structure.

Q. That is right.

A. Providing a marginal contract as the normal. Then of course anything below that would be subnormal.

2069 Q. And that entire retail structure then would fluctuate with the fluctuations in the spot market?

A. Not necessarily in direct proportion. There might be competitive conditions which would cause the spot market to go up and the retail price tend down.

Q. My assumption was that it was the policy of the market leaders to establish a normal retail price that bore a specific relation to the tank car price. That being true as the spot market fluctuated the retail price level would fluctuate too; isn't that true?

A, I was describing a successful policy; under your assumption, that is right.

Q. Now, come back to the question I asked you a little while ago: Assuming the situation that we just described, then in determining the factors that brought about the price levels prevailing for gasoline in the Standard of Indiana territory during 1935 and 1936, I suggest to you, and ask you to confirm, that you would look, first, to the factors that determined the prices obtained on that spot market by the independent refiners in the Oklahoma and

2070 East Texas fields.

A. That is, you would look there first for what purpose? To justify those prices?

Q. No, to find out what brought those prices about.

Mr. Lewin: What determined them?

A. I think that the spot market price would certainly be a basis to which you would look to determine a normal price structure in the Standard of Indiana territory.

It is not right that if the retail price were tied to the spot market, and if the prices to the jobbers were tied to the spot market, I would look to the spot market to find out what the factors were that produced fluctuations or lack of fluctuations in a given period, because of this fact: it is necessary to look, not alone to the factors which cause fluctuations in the spot market price of gasoline, but also to factors that cause fluctuations in the retail markets, the jobbers' markets, unless you are going to assume a theoretical condition in which everything is lovely and all prices are normal.

In referring to Exhibit 674, it seems that trend of retail prices followed the same general line as the trend of the spot market prices during the same period. I think that is correct, with the lag that was referred to this
2071 morning.

Q. Yes, and there is testimony here that it was the policy of the market leader specifically to post retail prices for this territory which bore a direct relationship to the prevailing spot market price, with only a lag between the time when the spot market price was up, we will say, and the time when the retail prices were raised. Now, I ask you to assume those facts. And you necessarily must assume from those facts that fluctuations in the spot market bring about fluctuations in the retail prices; isn't that true?

Mr. Thomas: Objected to as argumentative, calling for a conclusion, and not proper cross-examination.

The Court: Objection overruled. Go ahead. Exception allowed.

Mr. Thomas: And, if the Court please, instead of renewing that objection, may it be considered as though the objection were made and the same ruling and exception on all this line of cross-examination?

The Court: You may have that. Now, let the Reporter read that question.

(Question read by Reporter)

A. Assuming the conditions that you hypothecate, the answer is yes.

2072 Q. And then, in those conditions, if you wanted to find out what made the prices, the retail prices, we will say, fluctuate; and you say in order to do that you have to look and see what made the spot market prices fluctuate, because one fluctuated with the other; then I ask you whether it isn't true that, in order to find out what made the spot market prices fluctuate, you inquire into the factors that determined the prices obtained by the independent refiners in their spot sales?

A. You don't look alone to the fluctuation of the refiners' spot prices, to determine fluctuations in retail markets.

Mr. Chaffetz: That isn't the question.

A. I have made no study of the actual facts in this territory.

Q. We have assumed—we are assuming that the retail prices fluctuate with the spot market prices. That is an assumption I have asked you to make.

A. All right.

Q. I understand that you have made no study of that situation in this territory, have you?

A. No, sir.

Q. So that you don't know what the actual facts
2073 are; isn~~'t that~~ right?

A. That is pretty largely true, just in a general way, as I said yesterday, and said again today.

Q. I ask you again to assume the facts as I have stated them to you; that is, that the retail prices did fluctuate during that period, in direct relation with the spot market price. And, making that assumption, I suggest to you that, in order to find out what produced the fluctuations in either the retail prices or the spot market prices, the thing that you look to is the spot market prices obtained by the independent refiners, because their prices are the only spot market prices there are, and what the factors are that made those prices during that time?

A. You would look to the spot market prices of the refiners as a factor, there is no question about it, in determining the movement of retail prices.

Q. And under the assumption that I have asked you to make, you would look to that as the essential factor?

A. You mean assuming perfect relationship between the two in the normal market?

Q. That is right.

2074 A. I think that would be an important factor.

Q. It would probably be the only factor under that assumption?

A. No, I wouldn't go that far. I think conditions of demand, general business conditions and consumption in the retail market—

Q. Well, all right, we will come to that in a minute. You will agree with me to this extent: That it is the most important factor, that is, I shouldn't say the most important factor, the most important indication of the reasons for the fluctuation in the spot market prices, would be the factors that entered into the prices obtained by the independent refiners?

A. I wouldn't agree with that, no, sir.

Q. Now, let's see why not?

A. I would agree with the relationship that exists between the two but I certainly wouldn't agree that the influences that play on the price of gasoline, the retail price of gasoline, come from the price of gasoline at the refinery.

Q. Now, you refuse to make the assumption that I have asked you to make. I am asking you to assume, if you will, that the retail prices fluctuate di-
2075 rectly with the spot market prices; so that, when the spot market went up, the retail prices went up; and when the spot market when down, the retail market went down in the same proportion. I am asking you to assume that. You can do that, can't you?

A. Yes, sir.

Q. All right. Now, if, once you assume that, then the only things that made either one of those prices go up or down, were the factors that went into the prices obtained on the spot market by the independent refiners; isn't that right?

A. I would say that under those circumstances, the prices of gasoline to the independent refiner in tank cars would be a basic factor in that particular structure of prices.

Q. It would be the only factor, because those were the prices that made the spot market; isn't that true?

A. Assuming that that were true, the answer would be yes.

Q. Now, taking, then, the prices obtained by the independent refiners on the spot market, in order to find out what the factors were that entered into those prices, you would first look, would you not, to the
2076 supply and demand situation of that group of refiners who sold on the spot market?

If the independent refiner obtained orders for more gasoline than he could make, and if that were generally true of the class of independent refiners to whom we are referring, it would have the effect of firming the market. It would tend to bring prices up. Conversely, if the same class of independent refiners were making more gasoline than they had an immediate demand for, that would tend to weaken the market more or less.

If you had a situation where, over a period of time, the class of independent refiners in the Mid-Continent and East Texas who were selling on the open market were manufacturing more gasoline than they had an immediate demand for, during the period of time in which that condition existed, I would expect to find a weak market.

Q. And you would expect to find such a weak market, irrespective of whether in the country as a whole there was a sharp increase in consumptive demand?

A. If there were a very sharp increase in consumptive demand over the rest of the country, it would be hard to assume a distress situation or a surplus of gasoline long continuing in any refinery area.

2077 I testified on direct examination why it was that the independent refiner was gradually losing his markets.

Q. And it is possible that during the time that the independent refiner is losing his markets and his business is falling down, that the major companies as a group may be increasing their business and expanding their markets; isn't that true?

A. Yes, sir, there have been times of that sort.

Q. Yes. And it may also be true that, at a time when there is increased consumer demand, that that demand would be supplied largely and in greater relative proportion by the major companies than by the independent refiners; isn't that true?

A. Yes. Of course, under those circumstances, the major company would look to the small refiner, probably, for his resources of gasoline with which to meet that increased demand.

I would say it is intensely practical because that is precisely what happens. The major company, when he has more gasoline sold than he can deliver, buys from the small refiner.

During the spring of 1935, when the increased consumer demand to which I have referred developed in actuality, the condition changed very rapidly. During the first part 2078 of that period the independent refiners in East Texas and in the Mid-Continent fields had a surplus of gasoline; during the latter part of the period they had no surplus.

I would say that there was a time in the late spring or early summer of 1935 when the small refiners had an actual demand for such gasoline as they offered for sale.

Part of that excellent demand was certainly the sales made by them to the major companies. I think it is fair to say that the small refiners probably would have had a surplus of gasoline if they had not sold to the major companies. I think that is true.

Q. All right. And, having that surplus of gasoline, you would have expected to find a weak market, a weak spot market?

A. Well, I don't know that that would necessarily follow. The fact that the major companies came in and bought some gasoline, of course, leaves the question of what would happen, if they hadn't done that, highly speculative.

It is barely possible that, through brokers or otherwise, they would have found another market. Certainly they would have found another market after June, when that immense increase came due to exports. In fact, in the month of June, that began to take effect. There would
2079 have been a market there, for example.

Q. You think, then, that the gasoline that the major companies were buying in June from the independent refiners would not have been surplus gasoline, but would have been sold in the open market?

A. I don't know about that. I would say it would be hard to distinguish between the gasoline they bought from these companies and the gasoline they shipped from their own plants; it all went into a common market, and it is pretty hard to distinguish one from the other.

Q. In order to determine what the true situation was, then, you would want to have a good deal of information that you do not now have; isn't that true?

A. Not as to general effect and general outline on the market. As to the number of cars that went to one place or another, we would need a lot of information, and as to just what channels this gasoline moved through—

Q. No, no, that is not what I have asked you at all.

A. Well, I am sorry.

Q. You agreed with me, I thought, that if the independent refiners had a surplus of gasoline over 2080 their immediate demand, you would expect to find a weak market, no matter what other conditions existed in the country as a whole, did you not?

A. I think I hesitated in accepting that, because I had difficulty in imagining a weak market in one spot, and a strong market elsewhere, because refinery markets don't go that way, Mr. Chaffetz, they are too flexible.

I think they had a good market in the summer of 1935. There was a tremendous consumer demand throughout the country.

Q. That is right. That satisfies you that the independent refiners also had a strong consumer demand, and wouldn't have had any surplus gasoline on hand if the major companies hadn't purchased from them?

A. There was a very strong consumer demand, and it is my personal opinion that they might have found a market if the major companies had not bought, but that is my judgment.

The small refiner needed to sell his gasoline, of course, into the market in the summer of 1935. Now, whether he needed to sell it to the major companies or not, I don't know. I am not prepared to say that. My personal opinion is, he could have found a market. I think there 2081 was a very strong demand, and a very good market. That was true, in my opinion, throughout the entire summer of 1935.

I think the first really soft spot in the refinery market, and when I say soft spot, I refer to demand, price and so on, occurred along in late February and early March of 1936, after this additional price rise had taken place. We had a very disappointing demand, as I remember it, at that time.

I think, generally speaking, it was a pretty good refinery market throughout the year 1935, and I am judging that by the movement of tank cars.

Q. All right. So that you think that during the entire year 1935 the independent refiners would have found a market for all their gasoline in the regular markets on which they sold, if they had not sold to the major companies?

A. Now, that is a difficult question because one

of the regular markets on which they sold was the
major companies. You can't take part of their regu-
lar market away and leave them with their regular
market.

Q. I can eliminate the major company purchases
if I want to, can't I?

A. Then you will have to eliminate part of their
regular market, and send them into a new market.
2082 Mr. Chaffetz: Q. Let us not talk of regular mar-
kets or new markets. Let us talk about a particular
kind of markets. I ask you this question whether if
the major companies had not been buying gasoline
from the independent refiners in the group to which
we have been directing our talk during the year 1935,
whether in your opinion, those independent refin-
ers would have found a market for their gasoline to
jobbers?

A. My answer is that there was a very, very
strong consumer demand, a very large increase in
consumer demand, and it is my personal judgment
that if the small refiner had abandoned that part of
his regular market, which is made up of major com-
pany purchases and had sought a market elsewhere,
he could have found it, it might be, at prices of an
upset or market disturbance. Any readjustments of
markets of that type is usually accompanied by that
sort of result.

I have nothing better than hearsay knowledge person-
ally about periodical surveys made during the year 1935 of
the amount of surplus gasoline that the independent refin-
ers in the Mid-Continent area had on hand or would have
on hand during the coming months.

Q. Now, let us assume that situation, and as-
sume the situation to have been that the independent
2083 refiners did have surplus gasoline on hand continu-
ously in each month of 1935, and let us assume that
that surplus gasoline totalled in the Mid-Continent
fields from 700 to 800 cars a month. Now, I ask you,
under that state of facts, assuming that that 700 or
800 cars of gasoline were not sold to major com-
panies, but the independent refiners sought a mark-
ket for it in the open markets to brokers, jobbers
and dealers, what would you have expected to have
found with respect to the trend of the spot market
during that period?

A. I think that with some definite but temporary disturbance in the market, which would be an incident to this shift of market position, so far as the small refiner is concerned, that the firm consumer demand would have permitted those prices to have been maintained and kept about as they were. I grant you now a market disturbance while that shift was taking place. But all of this, of course, is very hypothetical.

If you will add brokers to your outlets, I think that with a reasonable disturbance in the market and a temporary one, there would have been a recovery of price and the outlet would have been established.

Q. Why would you say that there would be only temporary disturbance in view of my assumption 2084 that the amount of surplus continued to exist constantly through that period?

A. Your Honor, that is what makes the assumption so difficult, because the demand kept increasing—

The Court: When you are asked to assume a thing, you assume it to be a fact, whether it is or not.

A. Of course, if surplus continued to exist, that would mean the refiner would not have found a market. So long as a surplus exists, he hasn't got a market.

Mr. Chaffetz: Q. That is right, and so long as a surplus exists from month to month, so long as the independent refiners are making more than they have an immediate demand for, you are bound to have a weak spot market, isn't that right?

A. Yes, that is correct, as long as there is an excess of distress gasoline on the market, the market tends to be soft.

Q. That is right. Now, I am going to ask you to assume another thing, another fact. I direct your attention to any arbitrary period during the time when the tank car price remained uniform and level. We will take the 15th of July, 1935, and I am now pointing to Exhibit 712. Let us assume an inde- 2085 pendent refiner on this date has, we will say, 100 cars of gasoline in storage which he wants to move. You would say that if he had no immediate sale, no customer who was immediately prepared to take that gasoline from that refiner at the then market price of 4¾¢, you would call that distress gasoline, wouldn't you, if he was an independent refiner?

A. Yes, if he had that gasoline, and couldn't sell it at the market price, that would be distress for the time being.

Q. If he had it in the storage tanks on that date, you would call that distress gasoline?

A. One of the elements of distress gasoline is the ability of the owner to hold it. One of the elements of distress gasoline, Mr. Chaffetz, is if the man who has it is in a position where he needs to sell it, if you will assume that he has got to sell it.

Q. You want to limit the definition of distress gasoline to a man who has got to sell it? For what reason must he sell it?

A. He must meet his payroll or crude payroll or light bill. He might have to sell it in a week or he might have to sell it in 2 or 3 days.

Q. Then in your definition distress gasoline is not gasoline which the refiner has on hand which
2086 he has no market for today in the going market price, but is gasoline which he is compelled to dump on the market?

A. That is my definition, and I think general.

Q. All right. Let us avoid the use of definitions. Let us say a refiner has 100 cars of gasoline in his storage tanks on that date, July 15, for which he has no immediate sale at the price of 4¾¢, and he wants to sell. He can sell at a fraction below 4¾¢, can't he?

A. I think so, especially in the market as it was in the summer of 1935.

Q. But if he had an assured outlet for that and protected, at 4¾¢, he would not sell it to anybody else at 4⅜¢—at 4⅝¢, would he?

A. No.

Q. No, suppose this independent refiner is doing business with jobbers in the Indiana territory o[illegible]e spot market, and he has this 100 cars of gasoline, and on that day he had no jobber who would pay him 4¾¢ for it. If he had in back of him a major company buying program which took from him all the gasoline which he could sell at below that price, if you were that independent refiner, you would sell

2087 that gasoline to the major company buying program at that price, wouldn't you?

A. I would have to, yes.

Q. Now, conversely, if you were such an independent refiner on that date, and you were able to sell all your so-called surplus gasoline to a major company buying program at 4¾¢, what would be the lowest price at which you would sell that gasoline in the open market to a jobber?

A. 4¾¢. That is assuming we have no special relationship that we want to protect. That would be the proper answer.

Q. That is right. Your open market sales to jobbers who want to do business with you on that day?

A. That is right.

I would say that the broker price would be possibly just the broker's margin, which is usually ⅛¢ a gallon, below what you would have to give a jobber on that day. I think ⅛¢ for the broker is usual but some brokers might get ¼¢ a gallon. If the market was strong you might require that the broker get his commission from the man he was selling to. I think it is fair to say that usually, if you sold to a broker, you would expect to sell to him at ⅛¢ below
2088 the price you would expect to sell to a jobber. In a strong market, you might not do it, but I am perfectly willing to admit here that you would do it.

Q. Now, if you were an independent refiner who did business with brokers, and if the going market price was 4¾¢ and you sold to a broker, and you know you have to sell to the broker at 4⅝¢, if you were selling at the market, your price would be 4⅝¢?

A. Yes, under that assumption.

Q. And if you could sell to a major company at 4¾¢, you wouldn't want to sell at 4⅝¢ to that broker?

A. I assume that I would go to the major.

Q. If during that period you always knew you had back of you a major buying program which could take from you all the gasoline which you had that you couldn't sell at that market and you knowing the major buying program would take it at 4¾¢, that would be your going market price throughout that period, wouldn't it?

A. Yes, sir.

Q. Now, I want to discuss with you now some of the other factors—some of the factors that you emphasized that go into the price charged by the independent refiner for his gasoline. 2089

Let's take first, the Connally Act, during the period beginning March 1, 1935 and continuing down through the rest of 1935; the Connally Act was in effect, wasn't it?

A. Yes, sir.

In reality, what that signified was that there was a Tender Board operating in East Texas, which had the effect of prohibiting ~~and~~ preventing the movement out of East Texas, into other states, of illegal oil and its products.

There was no Tender Board in the Oklahoma field at all, or any place else in the Mid-Continent field.

The independent refiner in the Mid-Continent fields had not, generally speaking, been selling hot oil. The hot oil problem was largely confined to East Texas.

The Connally Act went into operation about the 1st of March. That prevented the independent refiner in East Texas from selling hot gasoline for interstate movement. Many of the independent refiners down there folded up and ceased to function at the time the Connally Act began to operate.

Q. Now, assuming that those who were left and who were now operating on legal crude only—assuming that they were manufacturing more gasoline than they had an immediate market for, would you not say that, despite the introduction of the Connally Act, you would expect to find a weak rather than a strong spot market in East Texas? 2090

A. Yes, sir.

Q. And if throughout the period that the Connally Act operated, the independent refiners in East Texas, were, week by week, manufacturing more gasoline than they had an immediate sale for and were looking around for places to sell it on the open market to brokers and jobbers, you would expect to find a weak market throughout that period?

A. Yes, sir.

Q. Now, in the Mid-Continent fields we didn't have the hot oil problem, but we did have the surplus gasoline problem; did we not?

A. To some extent, yes.

Q. So that I ask you whether, regardless of the operation of the Connally Act, if the independent refiners in the Mid-Continent fields were, month by month, producing more gasoline than they had an immediate sale for, wouldn't you expect that, so long as that condition existed, the spot market in the Mid-Continent field would be weak?

A. Yes, sir.

Q. Now, let's take the factor of increased consumer demand: No matter what the increased consumer demand in the country as a whole may have
2091 been, if nevertheless the independent refiners—

A. Pardon me. Is this an assumption?

Q. Yes. (Continuing) —if nevertheless the independent refiners in the Mid-Continent and the East Texas fields were actually producing month by month, more gasoline than that for which they had an immediate market, it would again follow that you would expect to find a weak spot market?

A. Yes, sir.

Q. And now let's take the allocation provisions of the refinery amendment, concerning which you testified at great length: and you told us how it was the function of your group to allot the total production that each refiner in the country could produce during the period beginning April of 1934 down until May of 1935; isn't that right?

A. Yes, sir.

Q. And if despite the allocations that you made under that refinery amendment, the independent refiners in the Mid-Continent fields and in the East Texas were actually producing, week by week, and month by month, more gasoline than they had an immediate market for, you would expect to find a weak spot market price?

A. Yes, sir.

Q. And, now, if, as you testified, through a volun-
2092 tary curtailment plan, about this period here (indicating) in the middle of March, you induced a large group of major oil companies to curtail their current operations, that alone—that curtailment of operations by the major companies at that time in and of itself would not have directly influenced the spot market prices in the Mid-Continent and East Texas fields—I will stop there.

A. You stop there. Did you start with an assumption that this excess existed?

Q. No, I am going to deal with that separately.

A. Then we have no assumption here?

Q. No assumption.

A. I would say that the effect of that curtailment, Mr. Chaffetz, under the conditions that existed would be to increase the desire of the major companies to purchase gasoline in proportion to the extent that it increased their need for the product.

Q. I was trying to eliminate that with this question. I was going to deal with that in the next question.

I wanted you to say that the mere curtailment of the production of the major companies, in and of itself, the mere fact that the major companies' operations were cut down would have no effect on the spot market in the Mid-Continent and East Texas fields.

2093 A. Oh, just of itself I would say that the effect would be imperceptible.

Q. Imperceptible. That is right. Its effect on the spot market is brought about only in so far as the major companies buy gasoline from the independent refiners on the spot market?

A. In those circumstances?

Q. Yes.

A. That is correct.

Q. And then if you wanted to inquire into the precise effect of that buying, you would want to know, wouldn't you, whether that buying was done in concert, by the major companies acting as a group, under a plan, the purpose of which was to raise the spot market price or whether each of the major companies, competing with the others, went out to buy gasoline on the spot market at the best price at which it could buy, wouldn't you?

A. I wonder if your question follows the other one, that was the form of it; but I just wonder if it does. Would you mind considering the other question, and then this one, because I really don't understand.

Q. I will ask you three or four questions, then.

A. That will be fine.

Q. You agree with me that curtailment in the operations of the major companies does not by itself affect the spot market?

2094 A. I would say that it would have an effect, Mr. Chaffetz.

Q. But it would be imperceptible, that is what you said?

A. That is what I said.

Q. It might have a psychological effect?

A. We were dealing with this particular case, were we not?

Q. That is right.

A. I think of and by itself it would not have a major effect; it would have had a very small effect.

Q. And the same is true of any reduction in the amount of inventories in the country as a whole at that time?

A. Well, the effect would be in proportion to the reduction.

Q. The effect on the spot market?

A. Yes.

Q. Suppose the inventories of the major companies were sharply decreased, just the inventories, the mere decrease, by itself, without reference to any buying by the major companies, but just a mere decrease in the inventories, would not have any perceptible effect upon the spot market, would it?

The Witness: We are assuming, your Honor, a decrease in the inventories? And that the major companies don't do any buying? 2095

Mr. Chaffetz: Q. Don't do anything about it.

The Witness: And we just have a mathematical or statistical change?

Mr. Chaffetz: That is right.

The Witness: And we are just defying all economic effect.

Mr. Chaffetz: That is right.

A. Well, then, under those conditions, of course, if they did not buy there would not be any effect on the spot market.

Q. Variations in the inventories of the major companies do not by themselves affect the spot markets in which only the independent refiners sell? Isn't that right?

A. We still have that same assumption?

Q. That is right.

A. If they don't buy?

Q. Yes, without reference to the buying by the major companies.

A. I would say that if they did not buy, of course you would destroy the cause and effect there—have no effect at all.

Q. There is no effect on the spot market.

A. That is right.

Q. And then I say that the only effect that comes 2096 to the spot market by reason of any of those things, either by reduction in inventories or curtailment in the daily operations of the major companies, comes when and to the extent that such major companies buy in the spot markets?

A. Trading is the very life of a spot market. Of course, if you don't have it, you don't have a spot market.

The Court: You haven't answered the question.

Mr. Chaffetz: I ask that the answer be stricken. I don't quarrel with it, but it isn't the answer the question calls for.

Will you read the question, please?

(Whereupon the pending question was read by the reporter.)

A. Insofar as the spot market is affected by major company purchases, of course they have to buy.

Mr. Chaffetz: That is not the answer, either. Will you please read the question again?

(Whereupon the pending question was re-read by the reporter.)

A. You are entitled to an answer of yes to that. I misunderstood your question. I didn't realize that you had confined the first part of it to major companies. That is all right. The answer is yes.

Q. And in order to determine what the effect on the spot market of such purchases was, you would 2097 have to know all the facts and circumstances under which such purchases were made; isn't that true?

A. You mean—all of them?

Q. Generally.

A. I think we would have to know the—we would have to know the purpose and motive of the buyer, Mr. Chaffetz.

Q. That is right; that is right.

A. To a reasonable extent.

Q. That is one thing. You would want to know, for example, whether the buying was regular, continued regularly over a period of time, wouldn't you, or whether it was sporadic; that would have an effect on the level of the spot market prices, wouldn't it?

A. Well, I wonder about that. I think that the spot market is an immediate thing, and I think the important thing is that the buying exists and not that it might exist 6 months from that time.

Q. But if we are dealing with the trend of the spot market from day to day the continuity of the buying would have much to do with it?

A. Oh, yes, it would.

Q. And you would want to know whether the major companies were buying the market up or whether they were buying the market down, wouldn't you?

A. I think that the market going up is an effect, 2098 isn't it, that comes from the buying?

Q. It might come from the buying, isn't that what you mean?

A. Under normal conditions. Under ordinary conditions of spot market trading, doesn't the advance of prices come from the buying, rather than the buying come from the advance of prices.

Q. Wouldn't, for example, an increase in prices come quicker and be more accentuated if the purpose of the buyer was to buy the price upward?

A. It might come quicker, yes.

Q. And much might depend on the manner in which the buying was done by the particular refiner, as, for example, if the purchasing refiner was intent on keeping the price down, he might shop around?

The major company would shop around for a place where he could buy the gasoline more cheaply, as distinguished from the major company who is interested in bringing the price up; in which case he would be pleased to pay a higher price for the same quality of gasoline; isn't that true?

A. You mean, if he was trying to buy the market up?

Q. Yes.

A. Yes, he would be pleased to pay a higher price.

Q. And if there were a system of recommenda-2099 tions, whereby a committee recommended to the major company buyers, from time to time, as to what price they should pay, so that they accumulated and would be buying a certain quantity at such a recommended price, that would tend to improve the spot market price, wouldn't it?

A. I think that would depend on what they recommended.

Q. And if the recommendations were for the purpose of making prices higher, then you would certainly agree with me?

A. So long as they kept recommending higher prices, the market would certainly continue to rise.

Q. If a major company needing gasoline, we will assume, could buy gasoline in several different places, as, for example, from another major company, or from the Gulf Coast, from refiners on the Gulf Coast, independent refiners on the Gulf Coast, or from refiners in East Texas, and if that refiner-buyer, major company buyer should add its purchasing to that of other major companies buying in East Texas instead of from major companies, or instead of from refiners on the Gulf Coast, that would have the effect of improving the price in the East Texas spot market, wouldn't it?

A. You are not dealing now with the recommended price?

Q. No.

2100 A. You are dealing now with competitive prices.

Q. That is right.

A. Oh, yes, as you increase competition you increase the price.

Q. Have you heard the term "judicious placement" of orders?

A. No, sir, I have not.

Q. If a group of refiners interested in raising the spot market price should place their orders judiciously where it would do the most good, that would have the effect of improving the spot market where those purchases were made, wouldn't it?

A. So long as that activity was maintained I think that would have the effect of strengthening the market.

Q. Now, I ask you whether in testifying with respect to the causes that brought about, first, the increased prices in the spring of 1935, and the uniformity of prices from spring until the end of that year, you would not have to be informed with respect to the very things which you and I have been discussing in the last 5 minutes, mainly, the character of the buying that was done by the major companies during that period?

Mr. Donovan: Now, your Honor, I object to that question. He has proceeded upon a basis of assumption. Now he asks the witness to take those assumptions as facts. 2101

Mr. Chaffetz: I did not.

Mr. Donovan: That is specific in your question.

Mr. Chaffetz: I purposely avoided that. All I said to the witness was that he would want to know whether those assumptions were true, and what extent, and what other facts were true. He would have to know what the facts are before he could intelligently tell this jury what the causes were that brought about that trend of prices.

The Court: He may answer that. Exception allowed.

A. On the basis of your assumption that such an activity was going on in the way you have described, with constantly higher recommendations, I think that certainly would be a factor that would have to be taken into account, and I would need to know something about it if I attempted to describe conditions.

Mr. Chaffetz: Q. What I am driving at is this: If there were major company buying programs going on during that period, you would have to know a good deal about those major company buying programs, before you could express any opinion as to what the essential factors were, the important factors were, that brought about that trend of prices.

A. Assuming that it was of any size or importance, I think that is true. 2102

Q. Yes, that is right. I think you testified—I know you testified that at the end of May you ceased to function under the refinery amendment.

A. That is correct.

Mr. Lewin: Can he point out there (referring to Exhibit 674) when the Code went out, on that chart?

Mr. Chaffetz: Q. I think you testified May 28?

A. Yes, that is correct. Right here (indicating).

The Court: Just mark an "X" on there, a large X.

A. Do you want a heavy one? (marking on exhibit)

Q. Yes. Now write on there "date of expiration of code". Will you write that on there?

A. Yes, sir (witness writes on exhibit).

The Code stood to expire June 16. We made allocations on the understanding that they were good until June 16 if the Code expired and was not immediately extended. The Code did expire, and those allocations for June were not affected.

Beginning on this date, May 28, and throughout the rest of that year, all the refiners, both major and independent, were under no legal restriction with respect to the operation of their plants, within their respective capacities.

I think it is true that there was no shortage of refining capacity in the country at that time, but I would like 2103 to qualify that by saying there might have been individual plants here and there, but I am speaking of the country as a whole. I think the same is true for the Standard of Indiana territory as a whole, as to the aggregate of plants supplying that territory. I think they had enough capacity to meet the demand. I think they had enough capacity to more than meet the demand the year around. That is, assuming the right to build up seasonal inventories that we do in this case.

Q. They have had more since May 28 than they had before because there has been no restriction?

A. The industry could manufacture in its full stride.

Q. As a matter of fact, the seasonal inventories built up in the winter of 1935 and 1936 were so great as to have become a matter of concern in the industry; isn't that true?

A. Yes, they were high. They were not high in the number of days, I think. They were high, I think, in the aggregate. I think that was giving some concern in the industry.

Q. When you testified on yesterday you referred to a ceiling above the tank car price which I think you sought to indicate had some effect upon the uniformity of the tank car price. You said, I think, that where you have a uniform ceiling, uniform retail 2104 price, you might expect to find a uniform tank car price level, didn't you?

A. Yes, I think I stated that there was a relationship ordinarily, that I felt that under those circumstances at this time the relationship was very close. And I think I predicated that on proration, and so forth.

Q. No, we are talking now between the retail price and the tank car price. But all you meant to point out, though, as I understood your testimony yesterday and today, was that there was that relationship between the retail price level and the tank car price level?

A. My testimony then and today, Mr. Chaffetz, would both need to be predicated upon this crude situation, because if we did not have this stable crude situation we could not even have normal retail markets, and without normal retail markets there is a tendency for the relationship in that retail price and the tank car price at the refinery to be destroyed.

Q. Assuming the crude situation that you have described, if the fact was during 1935 and 1936 in the Standard of Indiana territory that the level of retail prices was tied to the tank car market and fluctuated with it, then the fact that the tank car price was level would be the factor that would tend to in-
2105 dicate why the retail price level remained uniform, rather than vice-versa; isn't that so?

A. Granting that assumption, that is true.

Q. That is true. And you had made no study to determine what the actual factors were that brought about the relative uniformity in the tank car price and retail price in the Standard of Indiana territory?

A. Mr. Chaffetz, I have never in all my life made a detailed study. It is just my observation over a good many years, over a period of years.

Q. But you have made no specific study in this territory during the years 1935 and 1936?

A. Nothing that would rise, I don't think, to the level of a close study.

Redirect Examination by Mr. Donovan.

The factors that go to make up the tank car spot market price of gasoline, of course, start with the price of crude oil, the cost of transportation, and all of the ordinary costs of doing business. Those things are basic. Then, of course, would come the effect, the influence of marketing conditions. In 1935 and 1936 there was some gasoline sold by independent refiners to brokers on the spot market.

I think major companies were selling very little gasoline to jobbers on the spot market in 1935 and 1936.
2106 They were selling gasoline to one another, there were inter-company sales between large companies, but I don't think there was a great deal of gasoline sold on the spot market by major companies to jobbers.

Sales from brokers to jobbers are spot market sales.

A decline in the retail price has an effect on the spot market. If the retail price has a declining trend, or if it is spotty or sub-normal, particularly in large consuming centers, it will have a depressing effect on the tank car market for gasoline.

The refinery allocations stopped on June 14th.

(Witness marks date on the chart, Exhibit 674.)

Assuming that the Code expired, the allocations would cease on June 16th.

Mr. Lewin: Q. Do I understand they actually ceased with the Schechter decision, is that right?

A. That is, as far as I know, more of a legal question than anything else, because I don't know when we stopped, when the refineries stopped observing them. They had a figure for June, and whether they went clear through June or not, I don't know. I have no way of knowing.

Mr. Chaffetz: I understood the witness to say they gave them the statements that they were to be effective for the month of June if the Act was extended.

A. Yes, Mr. Chaffetz. We met as we always
2107 did, and went through all the regular routine, and then at the end, qualified it in that way, said, "Of course, if the thing goes out, this is off the 16th." Those allocations were made on May 13, your Honor.

The Court: Q. May 13th?

A. Yes, sir.

Q. But you don't know whether they abided by those or not?

A. I have no way of knowing.

By Mr. Kirkland

I know the Waggoner Company that is in Texas. They are a quite well known refinery in Texas. They have a modern refinery. I don't know if they have an Ethyl license. I know they have production. They are able to take care of their needs from their production.

Q. You know, do you not, that they have a large ranch with very valuable oil producing wells on it?

A. I don't know whether it is the same company that has the refinery. I know the Waggoner family. I know that.

Mr. Kirkland: Q. The same family?

A. Yes.

In regard to having sufficient production of crude for their own requirements, Waggoner differs from the ordinary independent refiner.

2108 Mr. Kirkland: Q. Now, you stated that one of the elements of distress gas was the ability of the refiner to hold it. In what respect do you mean, his ability or inability to hold it?

A. Well, he needs two things, storage and money. In regard to storage capacity, I know this, that at one time under the Code, and I believe that it was early in the year 1935, the Waggoner Refining Company had accumulated a very large quantity of gasoline which had been made over a considerable period of time. They had to have sufficient storage to hold it. There was quite a substantial quantity. They are reputed to be well financed.

I testified that the purchase of 75 cars by the Standard of Indiana from the Waggoner Company in March, 1935, would signify nothing as to necessity. I think the same would apply if I were asked about the purchase of 25 cars in February, 1935. I would make the same answer as to a purchase of 25 cars in January, 1935. I would make the same answer as to the purchase of 1230 cars in the year 1934 from Waggoner.

When I said it indicated nothing as to necessity, I meant to indicate that they had no need for it. Obviously they had some use for it.

Q. Some use for it. And that would be the same as to all these purchases, not only in 1935, but in 1934, and also in 1933, if questions were put to you, 2109 isn't that true?

The Court: You don't think the Standard of Indiana would go out and purchase gasoline if they didn't make use of it?

A. That is right, and having bought it, I don't think they would have thrown it away.

Mr. Kirkland: Q. That is right. A refinery, situated as the Waggoner Company was, both financially and with its production and storage, it was a rather good connection for any major oil company, wasn't it?

A. You mean a good connection for future purchases in case you would want some gasoline worse than you needed it then?

Q. Yes.

A. I think so.

Recross Examination by Mr. Chaffetz.

Q. Mr. Shatford, if the Standard of Indiana Company was buying gasoline from the Waggoner Company under a buying program, knowing what you know about the Waggoner Company, as you have just testified, you wouldn't think they were buying distress gasoline as you defined it?

A. No, sir, they would not.

Q. And any other major companies, defendants 2110 here, if they were buying gasoline from any independent refiners in the Mid-Continent or in East Texas, unless they were buying particular gasoline, particular gasoline that the refiner had on hand and couldn't keep any longer, either because he had no storage or for pecuniary reasons, financial reasons, you would say that such major companies were not buying distress gasoline?

A. Mr. Chaffetz, I can go all the way with you and say, "yes," except for one element in your question, and that is that you require under the terms of your question that the gasoline be made, and a small refiner has distress gasoline in his crude oil, because he takes his crude oil in today and puts it through his plant, and he sells his gasoline tomorrow or the next day, or the next day, and under my definition of spot sale, it might run for 30 days, and obviously it might be in the crude.

Q. But there would have to be the factor of no storage or lack of finances so that he had to dispose of it immediately?

A. That is my definition of distress gasoline, but, of course, in strong hands gasoline might ultimately become distress when it comes to over-burdening the market to a certain extent, and then strong hands become weak, and they have to let it go.

2111 Q. But they become weak only if the situation so develops that there is no longer any market in sight or for financial reason it has to be sold?

A. Or, because in their best judgment it is time to sell. You remember I testified on direct that inventories might easily be distress gasoline.

Q. Inventories of independent refiners?

A. No, inventories of major companies sometimes go on the market and become distress gasoline.

Q. We were talking about independent refiners, were we not?

A. If we were, I should apologize, because I didn't have that in mind in my answer.

Q. If you were talking about independent refiners, what I said was true?

A. If I was talking about independent refiners, what you said was true, because my talk about inventories wouldn't apply.

Q. All right. That is all.

2112 **F. W. FISCHER**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I live at Tyler, Texas. I have been engaged in the practice of the law about 30 years. My business has been mostly litigation in connection with the oil producing and refinery business.

For the last 6 years, I represented practically all the independent refineries and independent producers in the East Texas oil field. McMurray Refining Company, Dominant Refining Company and Cascade Refining Company were my clients. Also I represented Trinity Refining Company in 1934, but not in 1935. I represented Tower Refining Company in 1934 and previous years. I still represent Southport Petroleum Company. Century Refining Company and Arrow Refining Company are my clients. Tyreco Refining Company was in 1934, and Wabash Refining Company while it was in existence. It is not in existence now. I never represented Chief Refining Company. I represented Gilliland Refining Company, Utah Refining Company, Panama Refining Company, Petroleum Processing Company, and Roco Refining Company. I represented Texas Oil Products Company in 1934 and 1935. I represented Canyon Refining Company while it did business.

I represented Union Refining Company part-time. I
2113 never represented Treo Refining Company. I represented independent oil companies. I never represented a major oil company.

In addition to my law practice, I happen to have 39 oil wells in the East Texas field that I accumulated along while I was representing these folks. The Railroad Commission's estimate on the production capacity of each one of my wells is a little over 800 barrels an hour. But I am restricted to 20 barrels a day from each one.

The East Texas oil field is about 50 miles long and an average of about 10 miles wide. At the present time there are approximately 25,000 wells in the field. About 20,000 wells were located in the field during 1935 and 1936.

During the years 1933, 1934, 1935 and 1936 on the Railroad Commission's figures of the producing capacity of the wells, I think that field would have been capable of producing something like 300,000,000 barrels a day. It did not actually produce that quantity of oil during each of those years respectively because the production was restricted under what they call proration. The Railroad Commission of Texas had control of that proration, and restricted the production.

The Railroad Commission, ever since this Petroleum Code was started, would receive each month a statement from the United States Bureau of Mines informing
2114 the Railroad Commission what was the consumptive
demand for Texas for the next month. The Commission would then fix the allowable, or fix the amount of oil that would be permitted to be produced for January. It would divide that up into days. It runs, usually, about 1,300,000 barrels a day for Texas. The Commission would divide that around among the various pools in the state. The amount of oil that is permitted to be produced in the East Texas field is something like about 475,000 barrels a day.

As I understand the Interstate Compact Act, it is authority by Congress for the executive branches of the different oil producing states to get together and talk over how they are going to restrict the production of oil. That Act, of course, gives them immunity from any prosecution under the Anti-Trust laws. Oklahoma will say, "We will produce so much this month," and Texas, "We will produce so much," and they sort of agree on a restricted production between all of them.

The Railroad Commission of Texas attempted to restrict the production of crude oil in East Texas in 1933 and 1934. In 1933, it was restricted from 350,000 to 400,000 barrels a day. And in 1934, it was a little more, I think, about 400,000 barrels a day. That was what the Commission permitted to be produced. However, that wasn't what
2115 was produced, by any means. The Commission was
unable to enforce its restriction orders.

I know how much hot oil was produced, but only by general estimate. Nobody knows exactly how much was produced. The Railroad Commission didn't have any record. Their statements estimate it. I think my idea about it is better than anybody else's, because I was more intimately connected with it than anybody else, not as a producer, but as a representative of the folks that produced the excess oil.

I estimate from 150,000 to 200,000 barrels of excess oil were produced each day, over and above that permitted by the Railroad Commission's orders during those years. It was not like that all the time that I am speaking of now. It wouldn't be just a regular stream of excess oil produced each day. It would vary from time to time according to the markets. The market would become saturated, and you couldn't sell gasoline for 1½¢ a gallon, and you couldn't dispose of gasoline made from excess oil.

I want to make this explanation: when I say that I was connected with this as the attorney for those that ran the excess oil, I don't mean to convey by that that these men that produced this excess oil went out flagrantly and violated the law. Every bit of oil that they ran was run under the protection of injunctions issued by the State and
2116 Federal courts against the orders that were in effect.

I was the attorney for those refiners. There was one injunction issued by a 3-judge court, Judge Hutchinson was the presiding judge, that remained in effect from early in 1933 up until pretty late in 1934. That was the injunction that protected the refiner buying oil, producing it and transporting it, because there was no statutory authority yet in the State that gave the Commission control over refineries in the State.

The posted price for legally produced crude oil in April, 1933 was 10¢ a barrel.

Mr. Lewin: Just a minute. I move that that be stricken, your Honor. We weren't going to make any objection to the price of crude oil that obtained from the time the Code started, which was $1.00. That has been testified to here, time and time again. We don't think it is relevant, but we weren't going to make any objection to it. Now, this witness has gone back into April of 1933.

The Court: Your motion to strike will be granted. Exception allowed.

I think the price of crude was advanced to $1.00 along some time in September or October of 1933, and continued at that price, I think, up until 1935. I don't remember right now the prices of crude oil after January, 1936,
2117 and through the remainder of that year. It was above $1.00.

I know how the price of hot oil compared with that of crude oil which was produced within the allowables fixed by the Railroad Commission, in that period from September, 1933 through 1935. It averaged all the way from 20¢

up to about 35¢ a barrel. This so-called hot oil was used by the various refiners in the East Texas field, and shipped out to other refiners in the Texas area, Fort Worth and Waco.

Q. Did those refiners sell this gasoline, made from the hot oil, for the same price that refiners that made their gasoline from legally produced oil were asking?

Mr. Lewin: The same objection, your Honor. This is the price of gasoline, back in 1933 and 1934.

The Court: Objection sustained. Exception allowed.

The refiners who utilized this hot oil sold it in commerce to purchasers and users of gasoline. This production and utilization of hot oil in East Texas did not continue throughout 1935 and 1936. There was no excess oil produced in 1935 and 1936 that is, very little, if there was any produced. After about January or February, 1935, there might have been a little excess oil produced and used, made into
2118 gasoline which went into intrastate markets, sold in Texas; but there was none shipped in interstate commerce after March 1, 1935.

Something occurred about December, 1934, affecting the production of hot oil in East Texas. That was an order of the Railroad Commission put into effect on December 10, 1934, which was based upon a statute passed by the legislature of Texas that became effective at that time.

Until that time there was not statute in the State that authorized the Railroad Commission to require tenders to cover the shipment of refined products. When that statute became effective, then the Railroad Commission put into effect an order which prohibited the railroad companies or any other carrier from transporting, receiving or transporting oil or the products of oil unless the shipment was accompanied by what is known as a tender from the Railroad Commission's Tender Board, that they established there in the East Texas oil field. In other words, the tender is, in effect, a certificate from this Tender Board of the Railroad Commission that the oil accompanied by this tender or the gasoline accompanied by the tender was manufactured from legally produced oil.

That had the effect of immediately stopping the shipment on the railroads of all gasoline that didn't have
2119 a tender accompanying it. However, one of the Federal judges down there, Judge Duval West, had held

that a state law did not apply to an interstate shipment. This order of the Railroad Commission stopped the transportation of refined products in the State of Texas, unless it had a tender with it. Nevertheless, the railroads accepted this hot gasoline for interstate shipment and shipped it in interstate commerce, until finally an injunction was granted against the railroads from accepting those products for interstate shipment unless they had a tender accompanying them.

That injunction finally was granted about the last of January, I think, and remained in effect until the Federal Tender Board went into effect on March 1st.

The list of names that you read of certain independent companies I mentioned were clients of mine. Those companies were dealing in excess gasoline, in excess gasoline over the allowables, or hot oil, during December, 1934. Every one of those refiners was protected by injunction issued by the Federal court, in which the court held that Texas had no jurisdiction over refineries, and that the refiners had the right to buy and sell their products without any interference from the Railroad Commission. Consequently, they did deal in considerable hot oil. When I say hot oil, I don't mean stolen oil; I mean that which was produced from their own properties, or bought from
2120 some man who had produced it from his own property, but it was in excess of what the Railroad Commission permitted.

I am familiar with the organization of the East Texas Refiners' Marketing Association. I know the events leading up to the organization and consummation of that Association.

As I stated, the statute that the Legislature of Texas passed, giving the Commission authority to issue orders restricting the shipment of oil and the products of oil on common carriers, unless such shipments were accompanied by tenders issued by the Railroad Commission, went into effect in December, 1934. The Commission got out an order which, in compliance with this statute, would prohibit the shipment of these products by the carriers without a tender.

To my way of thinking, and in my judgment, that statute was valid, and those orders were valid, and my clients would consequently be left there with these products on hand and unable to ship them, in view of that order. Of course, at that time, Section 9(c) of the Recovery Act was still in effect. But I had it under attack at the same time in the Supreme Court of the United States, and I figured on winning that lawsuit, which I did. I represented these refiners in that suit. But this State statute, in my judgment, was valid.

2121 So I had a meeting of these refiners, and told them that they would have to prepare themselves to do business and carry on their business on legally produced oil thereafter; that we couldn't get rid of the products of this excess production because of the law, and from now on, since we had valid laws, we would have to obey them. So they got busy. They said, "All right, where are we going to find a market for our gasoline."

They got together to create an organization, a selling organization. I had in mind that we would make a central organization, so that each refiner could turn over its surplus gasoline to this central organization and dispose of it, something on the order of those coal companies up there in the East, that had an organization of that kind, a selling organization, and the Supreme Court of the United States said that was all right. That was the planning of this organization, a central selling organization. Each refiner was to sell his products to his own customers, and his surplus was to be turned over to the central selling organization, and he was to dispose of it through new customers, wherever he could find them.

We went to the extent of purchasing a terminal down on the Coast, so if we couldn't sell our products in this inland country, they could be shipped to the Coast and 2122 exported, or sold on the Atlantic Seaboard. That was the mechanics of it.

I drew up the papers for this organization. It was called the East Texas Refiners' Marketing Association.

I am acquainted with Neil Buckley. The first time I ever met him, I think, was about February 1, 1935. I don't know what connection he had with the East Texas Refiners' Marketing Association. He came into my office in Texas and told me that he was going to see if he could call on some of the major oil companies and see if he could get them to buy some gasoline from our organization. He wanted to know whether or not these people that went into this organization were now in good faith, and were going to obey the law and not run any more excess oil. He said that he didn't want to go to his friends and attempt to sell any gasoline if these refiners were not in good faith. He came to me, as their attorney, to find out whether they were in good faith.

I advised him that they were in good faith, because they were obliged to be in good faith, and there wasn't any question about it. I told him why they were obliged to be in good faith. They were obliged to because the law prohibited it, because the law was in effect; it was valid, and they could no longer run any excess oil. I don't know 2123 whether Neil Buckley knew that without coming to me for information. Mr. Buckley did not live in Texas. I understood he lived in Tulsa.

I continued to keep myself informed concerning the conditions in East Texas during the period beginning March 1, 1935 and continuing on through the year 1936.

I had a second conversation with Mr. Buckley after the one I have just related. He came up there about a month later after he was there the first time.

Q. Will you tell us what the conversation was?

Mr. Lewin: That is objected to, your Honor.

Mr. Chaffetz: I wonder on what theory counsel asks this.

Mr. Donovan: I just remind your Honor they brought out this conversation from Mr. Buckley themselves. In addition to that, here these defendants have been charged with the instigating the formation of this Association. Now, I think we should be permitted to find out just what occurred, and we cannot find out unless we know what those conversations were.

Mr. Lewin: My recollection is very clear on that. Mr. Buckley volunteered the fact that he had a conversation with Judge Fischer, and he wanted to go on and relate it, and I cut it off, and you asked me—I remember your question—"Do you want the 2124 conversation with the Judge?" And I said, "No, I don't want the conversation with the Judge because I do not think it is material." Now, that is the basis for going into this conversation, not with Neil Buckley who was on the stand and was testifying as to facts, but with Mr. Fischer.

Mr. Donovan: He says himself he would not let Buckley talk about it.

Mr. Lewin: Well, there wasn't any point in talking about that. It was purely a self-serving statement. Now it is worse to come from somebody else. If it was inadmissible from Neil Buckley it is all the more inadmissible now.

The Court: Objection sustained. Exception allowed.

I was familiar with conditions in East Texas in the period beginning March 1, 1935, and that I am now. I do not think there was any excess oil produced in that period, except a little bit that went to trucks out through the state. By "excess oil" I mean hot oil, that was what it was called.

During 1935 and 1936 all the wells producing in East Texas were connected with pipe line outlets for the marketing of crude oil produced by them. I don't know of any wells that were shut down. I could not tell you
2125 definitely how many were new wells completed in the field during that period. There was no difficulty in obtaining pipe line outlets for those new wells as they were completed in 1935 and 1936. Connections were very much sought after by the pipe line companies. There was competition for these new wells among companies purchasing in the field.

It was not practicable from the standpoint of a refiner to utilize crude oil from the East Texas field and to obtain additional wells from which to purchase crude oil in the event of increased refinery demands, unless he would buy some pipe line system out. That was the only way he could get it, because every well was connected either to some major line or to some independent pipe line, and there were no wells to be had. Those producers did not just swap their connections off from one to another. When they get connected to one outfit and they pay them they just stay with them; and of course if he is producing to a measurer his new well goes to the measurer, and if he is running to an independent, his new well goes to the independent. There is no switching around from one to another.

It was not practicable in East Texas to speed up the production from wells already producing in order to obtain additional crude, because the Railroad Commission had a restriction upon the production. I think in
2126 1935 the maximum amount that could be produced from any well was about 23 or 24 barrels, and the rest of them, 20 barrels apiece in 1934 and 1935.

They couldn't speed it up because of the restriction. The Commission had restricted the production to what they called the consumers' demand, based upon that which the Bureau of Mines had furnished them.

Q. Let me ask you this question, Mr. Fischer, with reference to the price of gasoline: What factors relating to East Texas gasoline existed in 1935 and 1936 that did not exist in previous years?

Mr. Lewin: That is objected to because the witness has not been shown to be qualified as an expert on prices.

Mr. Donovan: He owns 39 wells.

Mr. Lewin: He owns 39 crude oil wells; he is a highly competent lawyer. I do not think that qualifies him to talk about the factors that enter into the prices of gasoline during that period.

The Court: Q. You are not a refiner, are you, Mr. Fischer?

A. No, sir, I am not in the refining business.

Q. You represented all these refiners?

A. Yes, sir; I am attorney for them.

2127 Q. Over a period of years?

A. Yes, sir.

Mr. Chaffetz: As a lawyer, and not an expert.

Mr. Donovan: Q. As their attorney did you become familiar with the factors that enter into the price of gasoline?

A. Yes, sir, I think so. I think I could answer that question all right from the information I obtained by reason of representing the refiners.

Mr. Lewin: It certainly would be very interesting to have a lawyer's comment on this information, but it certainly cannot be good evidence.

The Court: Objection sustained. We would rather have the man right in the refinery that knows something about it.

Mr. Donovan: Your Honor, may I present to the stenographer to copy into the record this offer of proof?

The Court: Yes.

Mr. Donovan: May we have it appear that this offer of proof was made under the same conditions as the other offers of proof which appear at R. p. 960 and R. p. 981?

The Court: Yes.

2128 Mr. Chaffetz: And that the government objected, and the court sustained the objection?

The Court: Yes. Exception allowed.

(The following offer of proof was made out of the hearing of the jury:)

Mr. Donovan: Mr. Fischer, if permitted to testify with respect to conditions in the East Texas field in 1933 and 1934, would testify as follows:

In February and March, 1933, crude oil was being produced in excess of the amount legally permitted of the allowables of the Texas Railroad Commission estimated as high as 210,000 barrels a day. Approximately 10,000 wells were producing in the field. In some portions of the field natural field pressures had dropped to a point where salt water was already coming into the wells.

Under these conditions the Railroad Commission of Texas shut down the entire field on April 2, 1933, and made a survey of the field to measure and determine natural field pressures. The field was permitted to reopen on April 24th. In an effort to induce operators in the field to produce in some measure at least within the allowables set by the Railroad Commission, the allowables for the entire field were increased to over 800,000 barrels a day. 2129 This was by far the highest allowable ever granted before or since by the Railroad Commission.

The granting of these allowables did not stop overproduction. The field produced at a rate of nearly 1,000,000 barrels a day. This figure included over 100,000 barrels a day in excess of the allowables. The price of crude oil in East Texas dropped to 10¢ a barrel.

In July 1933 the Department of the Interior under Section 9 (c) of the National Recovery Act, which prohibited the shipment in interstate commerce of crude oil produced in excess of State allowables or products manufactured from such crude oil, sent enforcement officers to the field to enforce this section of the Recovery Act. This action was successful for a period of approximately 60 days in stopping the movement in interstate commere of hot oil and products manufactured from hot oil.

During this period of 60 days over-production of crude oil in the East Texas field gradually decreased. As over-production decreased the natural pressures in the field returned to normal, and engineering estimates of the recoverable oil in the field were approximately doubled. In September 1933 operators in the field resumed production of 2130 crude oil in excess of state allowables, and hot oil production again mounted rapidly. On September 29, 1933, the posted price for legally produced crude oil became $1.00 a barrel. Over-produced or hot oil was at the same time selling from 20¢ to 35¢ a barrel. Approximately 80% of this hot oil or products manufactured therefrom was being shipped in interstate commerce, some of which moved into the Standard of Indiana territory. Refiners in the field operating on this hot oil were selling the gasoline manufactured therefrom in interstate commerce in competition with refiners who were operating on legally produced crude oil produced at $1.00.

During the first 10 months of 1934 over-production of crude oil continued at a rate averaging approximately 100,000 barrels a day. This over-produced or hot crude oil and gasoline manufactured therefrom continued to be shipped in interstate commerce. The price of third grade gasoline in the Mid-Western area fluctuated during the year from 4¢ to 2½¢ a gallon.

On October 24th the Department of the Interior under Section 9 (c) of the NRA established a Federal Tender Board in East Texas under the regulations of which persons wishing to ship crude oil or
2131 products therefrom in interstate commerce were required to establish that such crude oil had been produced in accordance with the allowables set by the Railroad Commission, or that gasoline sought to be shipped had been manufactured from crude oil so produced.

Following the establishment of these regulations under this Federal Tender Board over-production of crude oil dropped to approximately 5000 barrels a day. Prices of third grade gasoline in the Mid-Western area rose between October 17 and November 7 from 2½¢ to 4¢.

Mr. Chaffetz: Objection.

The Court: Sustained; exception allowed.

2132 **MARION M. TRAVIS**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My residence is Houston, Texas. I have been engaged in the producing and refining business all my life. I have engaged in that business in Ohio, Oklahoma, Kansas, Texas, Arkansas, and what is generally known as the Mid-Continent field. My business is conducted at this time by Southport Petroleum Company and affiliated companies. This company was engaged in the same business during 1935 and 1936.

Q. Will you tell us, did you utilize in your refineries crude oil produced in excess of Railroad Commission allowables or so-called hot oil in the East Texas field during the years 1933, 1934 and part of 1935?

A. Not so much crude oil as reduced oil.

By that I mean we bought reduced crude, that is, crude from which the gasoline and the kerosene had been refined through what is known as a topping operation, and we bought the residue which we utilized for cracking purposes. When I speak of the topping operations I mean by that a skimming plant.

The term "hot oil" is a popular known term, referring to oil produced in excess of allowables set by the 2133 Railroad Commission of Texas.

Q. Could you tell us whether or not this hot oil could be bought for a lower price than oil produced within the allowables?

Mr. Lewin: What time, please?

Mr. Donovan: I was just asking him during this period, 1933, 1934 and part of 1935.

Mr. Lewin: The same objection I made to Judge Fischer being asked the same question as appears at R. p. 1116. I move that it be broken down and limited to 1935, and we won't object.

The Court: The objection as to 1933 and 1934 are sustained. Exception allowed.

Mr. Donovan: Your Honor, may I present to the stenographer to copy into the record this offer of proof?

The Court: Yes.

Mr. Donovan: May we have it appear that this offer of proof was made under the same conditions as the other offers of proof, as appears at R. pp. 960, 981?

The Court: Yes.

Mr. Chaffetz: And that the government objected, and the court sustained the objection?

The Court: Yes. Exception allowed.

2134 (The following offer of proof was made out of the hearing of the jury:)

Mr. Donovan: Mr. Travis, if permitted to testify with respect to conditions in the East Texas field in 1933 and 1934, would testify as follows:

That he was operating a refinery in the East Texas field during this period of time and was intimately familiar with producing, transportation and refining conditions in the field.

That in the early part of 1933 there were 10,000 or 12,000 producing wells in this field and that said wells were being pro-rated under the regulations of the Railroad Commission of Texas which had, by order of that body, reduced the allowables of said wells to amounts averaging from 28 to 46 barrels per day for each well. At that time there was serious question about the validity of these orders and enforcement thereof was very lax.

As a result, there existed in the East Texas field an over-production or excess above allowable amounting from 50,000 to 210,000 barrels of oil per day. During this time there were two prices for crude: one a price for legally produced crude, and the other a price for excess crude.

2135 During the spring and summer of 1933 the total allowable for the field was increased from time to time, but enforcement of the orders of the Commission remained lax. The price of crude oil dropped as low as 10¢ per barrel.

After July, 1933, when the Department of the Interior commenced enforcement under the provisions of Section 9(c) of the National Industrial Recovery Act, there was a considerable improvement in the field conditions. Over-production materially decreased and the price of legally produced crude oil rose to $1.00 per barrel about September 29, 1933. But even at that time and thereafter, the price of excess or hot oil was from 20 to 35¢ per barrel and continued at about that level for more than a year thereafter.

Refiners in the East Texas field numbered some 75 or 80 during the year of 1933, and in 1934 there were some 60 or 70 refiners. Practically every one of these refiners were operating to a large degree upon excess or illegal crude or upon what was commonly called "topped" crude. As a result of this, these refiners could sell gasoline at prices from 2 to 4¢ per gallon and make a profit. It was then impossible for refiners operating on legal crude to sell gasoline for

any such price because such price would not yield
2136 recovery costs.

(This ends the offer of proof.)

The Witness: May I answer?

The Court: Answer for the year 1935.

I do not recall of excess crude oil being offered on the market in 1935. I certainly wasn't acquainted with sales or purchases to be made during 1935 with excess crude oil.

I am familiar with the organization known as the East Texas Refiners Marketing Association. My company is not now a member of that organization. It was a member. I was present at some of the organization meetings leading up to that Association. That Association was organized to act as a central agency through which the surpluses of gasoline produced by the independent refiners in the East Texas field, belonging to this organization, could be sold, beyond their markets that they had established, or channels for regular distribution. It was to act as a central agency, offering impartially for sale all of the gasoline that various refiners belonging to that Association would have for sale, with the idea of securing the best price obtainable.

I have known Neil Buckley since 1930. I know how he became connected with the East Texas Refiners Association. I suggested his name to a committee, of which
2137 I happened to be chairman, as the most likely man
that we all knew who would be apt to have contact with major oil companies and whom we trusted because of our past dealings with him. No major oil company ever discussed Neil Buckley with me in any connection prior to the formation of the East Texas Marketers Refining Association.

I never discussed the matter with Neil Buckley until the day that this committee met, after the meeting that we had held, I think, the night previous at Gladewater, where it was agreed that the formation of such a central agency would be desirable, and that this committee was appointed to work out the plans and the acquisition of somebody in connection with these plans for the sale of gasoline through this central agency. This committee was made up of independent East Texas refiners.

As to why Neil Buckley, and not someone else, was selected to contact the major companies, our choice was very limited. We couldn't very well go to a broker because this meant the elimination of brokers. We couldn't use one of our own people, because we had a job of selling to do which the refiners in the East Texas field were not in a position

to do. Neil Buckley was the only major oil company representative, with the possible exception of, Bill Tracey of Sinclair, with whom the East Texas refiners had con-
2138 tact. Neil Buckley came through the East Texas field occasionally, and was known to the East Texas refiners. The East Texas refiners had had previous business with him; had found him to be a square shooter, to use our Texas term; and we had confidence in him. It was for these reasons that his name appealed to me and to the rest of the committee as a man that we could engage for the job, or request for the job. At the time I suggested his name, he was employed by Cities Service Export Company.

Almost immediately after that first meeting our organization became fully organized. As a matter of fact, we did not contemplate even having a charter. Frankly, I don't know whether we ever got a charter.

None of these defendant major oil companies had anything to do with the formation of the East Texas Refiners Association, absolutely nothing whatever. Our organization, through its secretary, Mr. Cline, devoted itself largely to contacting major gasoline purchasers rather than the general run of independent jobbers or brokers, because we all marketed direct to the general run of jobbers and brokers ourselves, and what we were concerned with in this agency was to handle, through it, our surplus of gasoline that we could not sell ourselves. Major oil companies had been buying gasoline from us right along. The ob-
2139 jective here was this: Certain of the refiners were better acquainted with some of the major oil company brokers, such men as Jim Bradshaw, or Louie Green, and the idea was that such major oil company buying as would be made would be allocated equally among refiners having a surplus of gasoline in this agency. And Neil Buckley was requested to contact these major oil companies on behalf of this agency so that such buying as they would do would be done through the agency rather than from individual refiners, as they had done in the past, or through their own brokers.

By Mr. Francis

My company and I were members of this Association from the time it was originally started.

I know Mr. Arnott when I see him; and I met him, just for a moment, I think yesterday, or the day before. Mr. Arnott certainly never urged me, or with my knowledge, any other of the members in our Association, to curtail our gasoline production during 1935 and 1936.

Cross-Examination by Mr. Lewin.

I did not attend a meeting at Judge Starns' place in 1936, at which Mr. Buckley spoke, and at which he urged the refiners to curtail production. I don't think I attended any meeting at Starns' place in 1936. I don't recall attending any meetings in 1936 at Gladewater. I might have
2140 attended a meeting, but I do not recall having attended any meetings in 1936.

Mr. Cline never urged me to curtail my production. I could not say whether or not he urged other members of the Association to curtail their production.

I can't say whether or not Mr. Neil Buckley was in constant touch with Mr. Arnott during 1935. I knew he was in touch with him early in 1935, that is, Mr. Buckley told me that he was, but I don't know whether he was throughout the year. I do not know whether Mr. Buckley reported to Mr. Arnott during the summer of 1935 on the subject of whether or not the independent refiners were curtailing runs.

When our organization, the East Texas Marketing Association, was founded I requested Mr. Buckley to come down. I asked him if it would be possible for him to assist us. He advised that he would take it up with his superiors and let us know. He evidently did, because he informed us within a day that they would grant him a leave of absence to assist us. I assume his superiors were officials of Cities Service Company. Cities Service Export Company, I would assume.

It was the last part of January, 1935, that I first contacted Mr. Buckley for this position. It was very soon thereafter that I contacted him again. I think it is correct that he appeared in East Texas in response to that request as early as February 4, 1935. He worked with us
2141 continuously after that time for quite a while contacting major oil companies and urging them to buy gasoline from us as we requested him to come down to help us do.

Mr. Buckley had nothing to do with allocating among the members of our Association the orders from major companies that they placed through our Association; that was Mr. Cline's job. It wasn't Mr. Buckley's job, that I know of. Mr. Buckley's main job was contacting major oil companies.

Major oil companies constituted most of the customers through the Association. All the gasoline sold through that Association was surplus gasoline, surplus above what we could sell ourselves through our own regular channels. If that surplus gasoline hadn't been sold to the major oil companies through the Association, the refiners would have been forced to dump it on the market at lower prices.

As to whether it was the purpose of forming our Association to get the major oil companies to take it off our hands, I want to point out that, for instance, in our own company we didn't sell the major oil companies substantially any more gasoline after the Association was formed than we did sell them before the Association was formed.

Q. Well, Mr. Travis, I didn't ask you that. I
2142 asked you whether the purpose of your Association
wasn't to get the major oil companies to take your
surplus gasoline off your hands at a fairly high
price?

A. The best price obtainable.

Q. And isn't it true that you weren't selling very much to the major oil companies, and by "you", I mean the independent refiners in the East Texas field, during January, 1935?

A. I am only speaking for myself, and I sold them, the Cities Service Export Company, one order of 125 carloads in January, as I recall.

Q. How about the other independent refiners? Were they able to sell to major oil companies?

A. I am quite sure they were.

Q. Do you think all of them were in January, 1935?

A. That is just the point of this organization—all of them were—the major oil companies in buying would buy preferably through some refinery, probably because the gasoline was better, but that was the purpose of the organization, to centralize all the major oil company purchases.

I cannot say whether the Tide Water Oil Company was
buying any substantial quantity in January, 1935, from in-
dependent refiners in East Texas. I can't say whether
2143 The Texas Company was buying any substantial
quantity of gasoline from East Texas refiners in Jan-
uary, 1935. I could probably state it by telling you who I
did remember did buy.

Q. I would rather take it this way. Was the Continental Oil Company buying any substantial quantity of gasoline from the independent refiners in East Texas in January, 1935?

A. May I say that they didn't always buy every month. They sometimes bought one month and didn't buy the next month.

I don't recall any purchases made by Continental Oil Company in East Texas in January and February, 1935. That would be difficult for me to remember, about the Tide Water. The Tide Water Oil Company, it seems they had bought some gasoline, during that time or possibly prior. They hadn't bought any from us. I am not prepared to say from what independent refiners they had bought.

Q. Now, did The Pure Oil Company buy any substantial amount of gasoline from independent refiners in East Texas in January and February, 1935?

A. I don't know whether January or February, but in that very period, I think they did.

Q. You mean after March?

2144 A. No, I am not sure whether they bought after March or before March.

Q. You just don't know? How about The Texas Company; was The Texas Company buying any substantial amount of gasoline in the East Texas in January and February, 1935?

A. They didn't buy any from us.

Sinclair, Gulf, Cities Service Export Company, and I think, possibly the Sun are the only companies I can really recall that were making substantial purchases down in the East Texas field during January and February, 1935. Substantially the purpose of the Association was to get more major companies than those to come in and buy, and to get all the major companies who would come in and buy to buy more.

I certainly did not know, at the time we formed our Association, that the major companies were about to begin a buying program or pool to take up surplus gasoline, and I don't think any other members of the East Texas Association knew anything about that.

Q. Did you know of any plan on the part of the major oil companies at that time to take up surplus gasoline in the Mid-Continent field?

A. Frankly there had been so many plans of buying—

Q. I didn't ask you about that, Mr. Travis—

2145 A. —It would be a matter of confusion—I didn't know of any such plans personally.

Q. I asked you a simple question. Didn't you and your associates know at the time you formed that Association, which was at the end of January, 1935, and in February, 1935, that the major oil companies were inaugurating then a buying program in the Mid-Continent field to take up surplus gasoline?

A. I certainly didn't know.

By the Court

We always competed for customers. I sold some to Cities Service in January prior to the formation of this organization in January. I had no difficulty in selling to the majors.

Q. Why were you the moving party in this organization to form a selling agency if you had no difficulty in marketing your product with the majors?

A. This selling agency happened to be one of the two points with the program that I had suggested.

We had trouble marketing oil. There was always the competition and the question of having to market it on a basis that we would get back our cost and such profits as we possibly could get. We had to pay a valid price
2146 for crude or the posted price for crude.

It would be difficult for me to say whether we made a profit or not out of what we sold to the Cities Service Company in January, but it is very questionable at that time, because since December 10th—I believe we sold 125 car-loads to Cities Service in January, 1935. In our own particular case, I would have to explain just one thing: I testified a while ago that we were engaged principally in the processing of reduced crude, not crude. We sold to Cities Service gasoline produced from this reduced crude. And this reduced crude was eligible for interstate commerce, because it had been produced prior to December. Under those circumstances, as I think about it, we must have made a profit on that sale.

2147 L. S. WESCOAT, a witness for the defendants, testified as follows:

Direct Examination by Mr. Francis.

I have testified once before in this case and described my duties. One of those duties is the supervision of the books and records of The Pure Oil Company and the statistical organization of that company.

(Document previously so marked for identification received in evidence as EXHIBIT 739-A.)

Exhibit 739-A is a chart designed to show the sales of gasoline by The Pure Oil Company from January of 1931 to June of 1937 inclusive. It includes the months at the bottom of the chart, and on the side the number of gallons per month. As an illustration, in January, 1931 the sales were approximately 30,000,000 gallons, or 1,000,000 gallons a day. In June of 1937 the sales were slightly over 60,000,000 gallons, or approximately 2,000,000 gallons per day.

The variation of sales through the months of a year reflect naturally the varying motor conditions which create larger sales, larger demand in the summer months, and of course much smaller demands in the winter months.

Months also vary due to the number of days, and that is particularly illustrated in the month of February which usually declines out of proportion to the other months
2148 of the year because, generally speaking, it has only 28 days.

Certain of this information can be accounted for by ordinary and extraordinary occasions. For instance, in 1932 at this particular time (indicating on the exhibit) ½¢ additional tax on gasoline was being imposed by the federal government, and most of our customers ordered large quantities of gasoline the preceding months in order to get in under the wire before that tax became effective. Then there are other factors in here somewhat along the same line that will in a measure affect these curves.

(Witness describes graph of sales on chart, Exhibit 739-A.)

The years of 1935 and 1936 reflect the largest increase which I believe the company had ever had in any preceding year in its history. Having that sales demand, The Pure Oil Company had to get gasoline to supply it. I have prepared statistical data from our books and records, which will show the net crude oil produced and refined by The Pure, as compared with the quantity of crude oil required to supply gasoline sales. This is a correct tabulation.

(Document referred to received in evidence as EXHIBIT 852.)

I assumed that about 21 gallons of gasoline will come out of a barrel of crude, for the purpose of that tabulation—approximately 50%.

2149 The decline in the company's production results from its inability to produce from its reserves the amount of crude which it would like to produce, the reason being that, due to the proration laws in the several states in which we operate, the crude is prorated between all producers in the State on a formula basis, as prescribed by the particular Commission in that State charged with that responsibility.

The result is, that, in spite of the fact that during this period the company has been able to produce several times its requirements, it has necessarily had to supply that deficit through other channels, because of that situation.

As an illustration, at the end of 1934, we were obtaining from one of our principal fields in Van, Texas, an allowable of about 40,000 barrels of crude oil a day. That field is still able to produce more than the company requires for its entire needs throughout the country, and yet today our allowable, due to proration, is 19,000 barrels per day.

We also buy oil, some of which is run through our own refineries.

To make it clear, the difference between our own crude oil which we produced and refined, and the crude necessary to supply our gasoline sales can be gotten either in the
form of crude purchased from some one else and run
2150 through our own refineries or other people's refineries,
or in gasoline purchases.

We buy a substantial amount of crude, part of which goes through our own refineries, and part of which goes through other outside refineries, to enable us to get the gasoline from it, since we do not have the capacity to refine it. We would have had crude during 1935 and 1936 in excess of our requirements to cover our entire gasoline needs; but we did not have the capacity to run that crude, had we been able to bring it above the ground. In addition we could have produced several times our requirements of crude from our own reserves, but were permitted to produce only, as I recall, approximately 70% of our total requirements, and had to buy approximately 30%. So it was necessary for us to go out on the market and buy the gasoline.

I am not prepared to say whether we had as much crude oil of our own production processed by other refineries as we could have had processed, but I assume that we did under the conditions existing in the particular areas where that gasoline was required. In other words, this is a composite picture.

Exhibit 739-A also reflects the company's manufacture; the yellow area showing the gasoline manufactured by the company from crude oil and natural gasoline. Therefore, the area above reflects the amount of gasoline which 2151 the company is short, by months, and which it is required to acquire from some source in order to meet its sales demand during the period.

On this chart, the yellow area includes not only crude oil of the company which goes through our refineries, but crude oil purchased and run through our refineries. The yellow area represents all gasoline manufactured by The Pure from crude oil and natural gasoline, whether owned by the company, or whether bought by the company.

Having run our own refineries with our own crude and purchased crude, and gotten the amount of gasoline shown by the yellow, we are still short of gasoline with which to supply our sales demand, as indicated.

The four different sources—all shown on Exhibit 739A—from which we got our gasoline in 1935 and 1936 were: our own manufacture through our own plants, to the extent of their capacity, which includes both our own crude oil and crude oil purchased, to the extent that it is manufactured in our plants; the second or green area, representing the gasoline purchased from other than East Texas and Mid-Continent independent refiners; the third, or blue area, representing gasoline purchased from independent refiners in East Texas and in the Mid-Continent; the fourth area, or the orange, representing gasoline acquired through processing contracts with other refiners.

The area of purple running above the line of supply 2152 represents gasoline which, of course, is a reduction in inventories, and to the extent that it runs below net during the year, it represents additions to inventory.

The processing contract, as understood by us, is a contract whereby we furnish crude oil to another refiner who processes it for us into its finished products, at a fixed price per barrel, returning to us a given amount or a fixed number of gallons of gasoline; and in some cases all or part of the residue products; or in other cases, none of the residue products, paying us the market price for those products at the time the gasoline is delivered to us. In that way we acquire additional gasoline which we require for our needs. We started negotiations in December of 1934; and concluded them in January of 1935, under which we started to receive, early in February of 1935, gasoline under processing contract or contracts. We had this gasoline processed for the account of The Pure Oil Company in order to meet our gasoline sales demand.

The orange area, representing the gasoline received through the processing contracts, is in addition to that purchased through these two channels reflected by the green and the blue on the chart.

I am not in charge of our refinery operations. I know only from conversations that our refineries were running
at capacity—at economical capacity, at all times. So,
2153 we had these processing contracts made with some of
our competitors to make gasoline for our account. This source of supply still continues to be a substantial factor in our total supply of gasoline.

I have had a chart made just for the period 1934 and 1935 and 1936, which shows the amount of gasoline received or purchased by The Pure Oil Company from independent refiners in the East Texas and Mid-Continent area and from other refiners than those, and from our processing contracts. This reflects the statistical data which has been put in evidence in support of Exhibit 739-A.

(Documents offered are marked EXHIBITS 853 and 853-A respectively, and are received in evidence.)

Exhibit 853-A covers from January, 1934, to and including December of 1936. The green area represents gasoline purchased from other than East Texas and Mid-Continent independent refiners.

In January, 1934, we purchased approximately 1,500,000 gallons of gasoline. We were buying gasoline in 1934 from independent refiners in East Texas and the Mid-Continent area. That is shown by the blue area. Our purchases from independent refiners in East Texas and Mid-Continent areas practically vanished in November of 1934. It diminished to a very small amount. Our purchases from other
refiners increased about that time. Commencing in
2154 February of 1935, this chart reflects a tremendous in-
crease in the amount of gasoline being acquired through channels other than the company's own manufacture, going from approximately 1,000,000 gallons in February of 1935, to a top of over 13,000,000 gallons, in August of 1936. The top that was reached in 1935 was slightly under 11,000,000 gallons, in the month of June.

We increased both our purchases from independent refiners in the East Texas and Mid-Continent areas, and our purchases from other refiners.

I have had prepared statistics which reflect the source of gasoline supply of The Pure Oil Company expressed not only in quantities but in percentages for the years 1933, 1934, 1935, 1936 and 1937.

(Document referred to received in evidence as EXHIBIT 854.)

(Chart marked for identification received in evidence as EXHIBIT 854-A.)

This Chart 854-A reflects the source of the company's gasoline supply for the years 1933 to 1936, inclusive, and the first 6 months of 1937.

The yellow area represents the gasoline obtained from the company's own manufacturing operations, including natural gasoline. It shows a total of approximately 90% of its total requirements were produced through that channel in the year 1933; 92% in 1934; and it declined to 82% in 1935; 78% in 1936; and increased slightly to 79%
2155 in the first half of 1937.

That is a result of capacity operation of the refineries during the period up to 1936, when we installed some additional capacity to take care of our rising sales. The same thing applies in 1937, when additional refining facilities were included.

(The witness states the percentages shown on Chart Exhibit 854-A reflecting purchases from independent refiners in East Texas and Mid-Continent areas.)

That chart shows, in 1935, that the gasoline turned out through our own refineries increased very materially over 1934. It shows that our purchases from independent refiners in the East Texas and the Mid-Continent fields, increased in 1935 over those made in 1934. Those purchases from these refiners did not increase relatively as much as purchases made from refiners other than those in the East Texas and Mid-Continent areas.

I would say that our purchases from other than independent refiners in the Mid-Continent and East Texas areas were approximately 3 times as much in 1935 as in 1934; and from independents in the East Texas and Mid-Continent areas, our purchases were just about twice as much. So the proportion of our increase from others was larger than from independent refiners in the Mid-Continent and East Texas.

I have prepared some statistical data which shows
2156 the comparison between The Pure Oil Company's total gasoline supply and the total gasoline supply for

the oil industry in the United States in terms of days' supply for the period, November, 1934, down to December, 1936. This (indicating paper) is correct.

(Document referred to received in evidence as EXHIBIT 855.)

This tabulation sets out a comparison between the Bureau of Mine's figures of the Department of the Interior of the United States Government in terms of the days' supply at different periods from November, 1934 to and including December, 1936.

The Pure Oil Company's inventory of available supply has been computed on the same formula, and reflects, in November, 1934, an over-all inventory of approximately 23 days, including what we term "frozen stocks," which are not available for shipment or sale at any particular time. The total inventory in terms of days' supply of The Pure Oil Company in February, 1935 was approximately 31 days' supply. That is the over-all, including the frozen inventory. The industry's at that time was approximately 54 days' supply.

All of that for The Pure Oil Company as well as for the industry as a whole is not available for immediate use. The proportion of any company's inventory unavailable for immediate use is: Your pipe line content; your steamship cargo, which is constantly in transit; your tank car content, which is constantly in transit; and your car tank
2157 bottoms, which is a proportion of every tank in the
bottom which is never drawn down for operating reasons until the tank is cleaned out. That represents a substantial proportion, at least, of The Pure Oil Company's inventory during this period.

(Chart illustrating the data shown on Exhibit 740, received in evidence as EXHIBIT 740-A.)

Chart Exhibit 740-A contains the same type of information as the previous tabulation, running from January of 1931 to and including June, 1937, the top black line representing The Pure Oil Company's inventory at the end of each month during the period, the red line reflecting the company's gasoline sales during the period, and the bottom line representing the inventory, included in the total figures, which is not available for immediate sale.

Across the top of the chart are reflected the number of days' supply available for immediate shipment, not inventory, but those days' supply available for immediate shipment for the month indicated on the chart.

Looking at the chart, at the end of February, 1935, there was a stock unavailable for immediate shipment of approximately 26,000,000 gallons out of the total. I get that by looking at the figures over to the left.

At the end of February, the company had 16 days' supply of gasoline available for shipment. At the end of January, we had 11 days' supply. I get those figures off the top.

2158 (The witness reads from Chart Exhibit 740-A. The number of days of available gasoline supply on hand to meet sales requirements as of the end of December, 1931; December, 1932; December, 1933; October, November, December, 1934; January, February, March, 1935; and July, 1936.)

At the end of December, 1935, there were 28 days of supply available. That is when we were building up our winter inventory. That was the normal custom to build up the winter inventory.

During the period November and December, 1934, and January and February, 1935, the normal upbuilding of stocks was reversed, due to a number of causes. The inventory control allocations of the Code were in effect, and we were permitted to run only the amount of gasoline which was prescribed for us at that time by the Government. Difficulties existed in getting regular tender gasoline in the East Texas area due to the operation of hot oil merchants down there, and the situation was such generally in the industry that it was difficult to purchase gasoline at the points where this company particularly required it. And it wasn't until the turn came in 1935 and gasoline became more available, that we were able to start to build our inventory to a point where we didn't have to borrow gasoline by the tank wagon, as we were doing in the late fall of 1934.

2159 I think it is correct to say that our company in the latter part of 1934 and in the early part of 1935 from an inventory standpoint was in a worse shape than it had ever been.

(Chart supplemental to Exhibit 741 received in evidence as EXHIBIT 741-A.)

Exhibit 741-A represents the line of prices of the publications of Platt's Oilgram, Oklahoma refinery market, and the Chicago Journal of Commerce, together with a number of red dots each representing the purchase date and the cost per gallon of gasoline which was bought at a flat price by The Pure Oil Company from independent refiners in the Mid-Continent area, reflecting both regular grade and third grade.

Commencing in February of 1935 and until about June of 1935 there was an advance in the price of gasoline which is correctly shown by this chart.

As reflected on this chart, this company's first purchase of third grade gasoline on a flat price basis after the first of March, 1935, was on May 11, 1935 at ⅛¢ below Platt's Oilgram and the Journal of Commerce as of that date. Our next purchase at a flat price was on May 21, 1935, at the low of the Journal of Commerce, and ⅛¢ below Platt's Oilgram. The trend from that date on is practically at that level.

2160 During the period of the price rise we never made a purchase of gasoline for The Pure Oil Company on a flat price basis other than is shown on this chart. And considering the price rise prior to May 10, we made no purchases during that price rise at even the low of the publication.

67-70 octane was commonly referred to as housebrand in 1935.

Chart Exhibit 856 for identification shows flat price purchases of The Pure Oil Company for both third grade and so-called housebrand gasoline for the year 1936 as compared with the price quotations in Platt's Oilgram and the Chicago Journal of Commerce f.o.b. group 3. During January and February of 1936, we made no flat price purchases of third grade gasoline. We made a total of 4 different purchases of third grade gasoline during the year 1936 at flat prices, in the Mid-Continent area. They were all at the low of either Platt's Oilgram or the Chicago Journal of Commerce. None were above the low. We bought housebrand gasoline in 1936 11 times on 11 different days. There were no occasions during the year 1936 on which we purchased housebrand gasoline at a price which was above the low of both publications. The top line indicates the regular gasoline.

(Chart referred to received in evidence as EXHIBIT 856.)

2161 (Chart offered is marked EXHIBIT 857 and received in evidence.)

(Chart offered is marked EXHIBIT 858 and received in evidence.)

Exhibit 857 reflects the prices paid by The Pure Oil Company for third grade gasoline purchased at flat prices from independent refiners in East Texas, compared with Platt's Oilgram, f.o.b. East Texas refineries, date of purchase; reflecting the prices as indicated in that publication for the calendar year of 1935.

Our first purchase in East Texas in 1935 was March 25 at ⅛¢ below the low of Platt's Oilgram for that day. Our next purchase was made March 28 at ⅛¢ below the low. The next purchase was April 6, 1935.

That plat shows these stairsteps again, these increased prices during the period from March to June, 1935. The red dots show the days on which we purchased gasoline and the price which we paid for that gasoline, on a flat basis. We do not show the number of cars that we bought, but we have put in statistical data which shows the number of cars on each day purchased, Exhibit 741.

During the time of the price rise, from February to June, we purchased at no time above the low of Platt's Oilgram. We purchased below the low 7 times. We purchased 6 times at the low up to the first of June. So we bought below the low more often than we bought at the low.

2162 Chart Exhibit 858 reflects the price paid by The Pure Oil Company for third grade gasoline purchased at flat prices in 1936 from independent refiners in the East Texas field, compared with Platt's Oilgram, f. o. b. East Texas refineries, on date of purchase.

No regular gasoline was purchased in the East Texas field by us. It was just third grade. We did have some specifications for our gasoline, which I described in my original testimony, in which we gave the vapor pressure, the gravity and the octane, which we required of the plants that made our gasoline. Those were our standard specifications pertaining to third grade material which we were buying in that area.

During the year 1936 The Pure Oil Company bought gasoline above the low of Platt's Oilgram once. We did not buy any above the low during the whole year of 1935. We bought 13 times below the low of Platt's Oilgram in 1936, in the East Texas field. Before that price broke on February 15, 1936, in the publications, The Pure Oil Company bought gasoline below the low 3 times. It was ⅜¢ per gallon below the low on two occasions and on the other ⅛¢ below the low. The several dots that are shown on this plat, for 1936, show how much below the low we purchased at other times, during the course of that year.

I am familiar with the method used by The Pure Oil Company in arriving at a determination as to how 2163 much gasoline will be required to purchase at any particular time. It is a part of the regular office routine to make this determination and the records are available in the office. I am in charge of those records. In the course of my dealings as vice president I became familiar with it, and knew about it during 1935 and 1936.

Each month, in the field, forecasts or estimates are made, which come into the so-called Material Forecast Department in the office, as to the requirements, which they will need for the succeeding period in order to supply their estimated sales demand.

The refineries furnish the information to the same Material Forecast Department, indicating the total amount of products which they will be able to make during the corresponding period. They are then matched by the Forecast Department, who, in turn, advise the Buying Department what will be required in order to maintain what they consider to be normal inventories and to meet the sales demand. That is the manner and way in which we determined how much gasoline we would have to buy and when we would have to buy it.

The head of the Wholesale Sales Department, which department is charged with the responsibility of buying the gasoline, is R. H. McElroy, Jr. He has purchasers in different parts of the field.

He has one at Tulsa, Dewey K. Chamberlain. He is 2164 on a salary for the company. I don't know of my own knowledge whether or not he gets his directions from Mr. McElroy, as to how much gasoline to buy. As normal routine in the office, of course, he, Chamberlain, would have received his instructions from his superior.

Cross-Examination by Mr. Lewin.

Referring to Exhibit 858, I think The Pure Oil Company purchased gasoline a total of 55 times in East Texas on the spot market at exactly the low of that journal on a flat price basis. If you added 55 to the 13 which I said were purchased at various times during the year at prices under the journal, you would get the total number of purchases made by The Pure Oil Company in that field during 1936.

If you drew a line through the 50 some days on which we made purchases at the low of Platt's Oilgram, you would get a line which would correspond exactly with a line representing the Platt's Oilgram quotations.

Referring to Chart Exhibit 857, East Texas 1935 purchases, on 47 days we made purchases which were at the low of Platt's Oilgram. On 7 days, we made purchases below the low of Platt's Oilgram during that year. If you added the 7 and the 47 together, the total number of days on which we made purchases in the East Texas field would be 54 days.

2165 If you drew a line between those dots representing purchases made at the low of the quotations in that field, you would get a line which would conform exactly with the graph of Platt's Oilgram quotation.

During 1935 and 1936 The Pure Oil Company made purchases from independent refiners in terms of the publications which are not shown on these graphs. They were at the low of the publications. To get a fair picture of the way in which we purchased during 1935 and 1936, compared with the quotations, you would not have to add these purchases not shown on these graphs, not if you wanted to make a comparison with the spot market, because those were not spot market purchases, as we understand them.

Starting in the first part of March and running through the rest of the year, we did not make purchases at flat prices in the Mid-Continent field below the low of the Chicago Journal of Commerce and Platt's Oilgram quotations for regular or housebrand gasoline. We did make a number of purchases as disclosed by Chart Exhibit 741-A at exactly the low of those publications through that period. If you made a graph of our purchases of regular gasoline during that period in the Mid-Continent field it would correspond exactly with a graph of the low of those journal quotations.

With regard to the third grade in the Mid-Continent
2166 field, with the exception of 4 times in which we purchased below the low of both of those journals, a graph of such purchases, though it would be pretty spotty, to the extent that it applied would conform exactly with the low of the journals.

We made other purchases in the Mid-Continent field in addition to those shown here that were in terms of the low of the publications.

I can prepare a list of the companies from which we made these purchases, represented by the green on Exhibit 853-A, in the Mid-Continent and East Texas areas. I do not have it with me. That includes purchases from major companies. Whether it includes purchases from semi-major companies depends upon the definition of a semi-major company. I do not know whether it includes purchases from any defendants in this case. I haven't a list of those quantities from month to month, giving the name of the seller.

> Mr. Francis: I will furnish a list of names from whom we bought, represented by the green, for counsel for the Government.

I appeared as a witness before the grand jury which investigated the matters which led up to this indictment, approximately around June, 1936.

I introduced before the grand jury a chart prepared by our Refinery Department headed "Pure Oil Company 2167 Gasoline Chart for Years 1931, 1932, 1933, 1934, 1935 and part of 1936" for the purpose of illustration of what I was saying to the grand jury at that time. I would assume that this is the chart that I introduced.

I would like to say in that connection that that chart is, for all practical purposes, correct. When it became apparent that it would be necessary to introduce testimony before the Court, we had all our figures audited, checked to the last gallon, and they reflect possibly a very minor difference, but not very much. There are some slight differences, but not enough to affect the picture. It gives substantially the same general information.

This chart shows purchases, contract processing from other refiners, manufacture, sales and inventories also, superimposed one on the other.

At any point during the period covered by the study I can ascertain generally and compare the situations with regard to each of those elements as to the information shown there.

The purchases are shown at the bottom, both refined gasoline purchases and natural gasoline purchases. That includes purchases from all sources.

Beginning in February, 1935, it shows the amount of gasoline that we got under processing contracts with other refiners.

2168 This is not total manufactured (indicating). It is the total of purchases of ordinary gasoline, natural gasoline, that secured through processing contracts, and that through manufacture; which gives your total of gasoline supply. In other words, the chart reflects total manufacture. So that you cannot use the side figures as saying that this is the manufacture for a month. You must take the difference between the two points (indicating). This top line would not necessarily show the trend of our manufacture. On the contrary, it would not show the trend of our manufacture, because included in it are purchases and contract processing, which I have just explained. That is more truly reflected on the charts I have just presented, because there we have manufacture alone. Sales are shown in this chart, as are the inventories at each point for that particular month.

Mr. Lewin: I offer that chart in evidence, may it please the Court.

The Court: For what purpose? To contradict this (indicating)?

Mr. Lewin: No, for the purpose of elaborating that.

Mr. Chaffetz: It supplements the other charts, your Honor. It presents a different type of picture, based on the same figures.

(Chart referred to is received in evidence and marked EXHIBIT 859.)

2169 I am not competent to judge the requirements of this case, but I say that this chart, Exhibit 859, is substantially correct.

2170 PORTER LANGFITT, a witness for the defendants, testified as follows:

Direct Examination by Mr. Francis.

I live in Winnetka, Illinois. I have been with The Pure Oil Company since 1925. I am in charge of its 7 refineries. They are located at Smith's Bluff, Texas; Muskogee, Oklahoma; Health, Ohio; Toledo, Ohio; Midland, Michigan; Cabin Creek, West Virginia; and Marcus Hook, Pennsylvania.

I am familiar with the operations conducted in those refineries in 1935 and 1936. In those years our refineries operated at capacity, with the exception of the early months in 1935, when we were operating on allocations from the Code Committee until June of that year. After that time we increased the output of gasoline from our refineries and operated them at their maximum capacity.

If we had operated those refineries for the sole and only purpose of producing every drop of gasoline that they could have produced and if we paid no regard whatsoever to any of the by-products of crude oil, or their value, we could not have produced, through the refineries of the Pure Oil Company, sufficient gasoline to supply our sales demand.

In December, 1934, and January and February,
2171 1935, we made some processing contracts whereby we got certain other companies to refine gasoline for The Pure Oil Company. That was in addition to the gasoline our company purchased. These processing contracts were with Gulf Oil Company, Standard Oil Company of Louisiana, and Standard Oil Company of Ohio. Some of those contracts were on a month to month basis, and some were for a period of a month at the start, and then on a month to month basis. I do not believe I am in a position to say whether the gasoline from these processing contracts that I spoke about, the gasoline we acquired there or some of it, came from the Standard of Indiana territory.

Cross-Examination by Mr. Chaffetz.

We could not have produced more gasoline of the quality that our sales department asked for, and less fuel oil and other by-products from our refineries at any times during 1935 and 1936.

Even when our refineries are operating at full capacity, the production fluctuates from time to time.

Mr. Donovan: I would like to have marked for identification and to offer a stipulation between counsel for the Government and attorneys for certain defendants relative to the production and sales figures of Vickers Refining Company.

2172 The Court: It may be received.

(Document referred to is received in evidence as EXHIBIT 864, and read to the jury by Mr. Donovan.)

2173 A. L. REID, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Shreveport, Louisiana. I am now and was in 1934, 1935 and 1936 employed by Root Petroleum Company as auditor in its general office at Shreveport, Louisiana. Its refinery is at El Dorado, Arkansas.

I have prepared from the regular records of the company, which I kept, a schedule of figures showing our monthly production and sales of gasoline during the years 1934 to 1936, inclusive.

(Schedule referred to received in evidence as EXHIBIT 865.)

(The witness then stated the total production and sales figures of gasoline for the years 1934 to 1936, inclusive, such statement being omitted because such figures appear on the face of the schedule.)

No Cross-Examination.

2174 D. R. GRABLE, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Oklahoma City, Oklahoma. Since March, 1934, I have been employed by Anderson-Prichard Refining Corporation and by Coltex Refining Company as general auditor, part of my duties being to keep records of gasoline production and sales.

Anderson-Prichard Refining Corporation is an independent refiner. Its refinery is located at Cyril, Oklahoma. The refinery of Coltex Refining Company is at Colorado in West Texas.

I have prepared from the records which I kept two schedules showing the production and sales of gasoline by these companies during the years 1934 to 1936, inclusive.

(Schedules referred to received in evidence as EXHIBITS 866 and 867 respectively.)

(The witness then stated the gasoline production and sales figures for the years 1934 to 1936, inclusive, of Anderson-Prichard Refining Corporation and Coltex Refining Company, such statement being omitted because the figures appear on the face of the schedules.)

Cross-Examination by Mr. Lewin.

The figures on the schedules are on the production 2175 of finished gasoline as motor fuel. Anderson-Prichard Company is not engaged in the production of natural gasoline. It is engaged in the general petroleum business. Anderson-Prichard Refining Corporation is the refining part of the business. It has its own production of crude oil, but not adjacent to the refinery. The production of crude oil is the largest part of its business.

We do not refine all the crude oil we produce. We produce crude oil for sale. The refining of gasoline is not simply incidental to the rest of our business; it is part of the entire business.

We sell our gasoline in the Mid-Continent area, principally in Iowa, the Dakotas, Nebraska, Missouri and Indiana, practically exclusively to jobbers. We do not sell through our own service stations. We sell to jobbers under a formal contract covering a period of a year, based on the average of the averages of the quotations in Platt's Oilgram and the Journal of Commerce.

We sell gasoline on the spot market but infrequently and only a very small percentage of our sales in Oklahoma. Practically all of it goes into the northern area outside of Oklahoma under these contracts I have mentioned. Anderson-Prichard Company buys some gasoline on the spot market, but resales are very small in proportion to the regular refinery output. It buys more on
2176 the spot market than it sells, and these purchases are to fill the jobbers' contracts.

The Coltex Refining Company makes a few local tank wagon refinery sales. They are a very small percentage of the business. Coltex sells its gasoline in the same trade area as Anderson-Prichard Refining Corporation does, under identical jobber contracts. The only spot sales of Coltex are small, and they are in Texas, but none in East Texas.

(The following occurred in absence of jury:)

The Court: The Court has concluded its consideration of the motions of the individual defendants for directed verdicts, and is of the opinion that the motion of the defendant Audrain for a directed verdict will be and is granted.

The motions of the other defendants for a directed verdict will be denied.

The defendants may, if necessary, by proper motions after verdict, seek the same objectives that they have sought in their motions for a directed verdict. We all understand that. But in the present state of the record, the Court is of the opinion that the Government is entitled to have the issues in this ~~case submitted~~ to the jury.

2177 Mr. Thomas: May it please the Court; in compliance with the reservation we made and motions to dismiss and for directed verdict having been made as shown by the record herein, as to each defendant, both individual and corporate, said motions having been separately made as to each such defendant, and the Court having granted such motions as to certain individual defendants and corporate defendants, as appears by the record, and having now denied each and all the separate motions so made on behalf of the remaining individual and corporate defendants, each such individual and each such corporate defendant whose motion was denied excepts to the order so made denying his or its separate motion to dismiss and for directed verdict.

The Court: Exception allowed.

(A memorandum of the Order granting the Motion for Directed Verdict, filed at the close of the Government's case, as to the defendant R. O. Audrain is printed at p. 2475 of the Record.)

2178 JAMES A. MOFFETT, called as a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is New York City. I am chairman of the board of California-Texas Oil Company, Limited. I have been in the oil business approximately 31 years. I was vice-president of the Standard Oil Company of New Jersey until July, 1933. For a short time in 1934 I was vice-president of the Standard Oil Company of California, and since 1936 I have been chairman of the board of that company.

I was invited to Washington by Secretary Ickes before the passage of the Petroleum Code. I was appointed to the advisory committee of General Hugh Johnson of the N. R. A. by the President, and later, when the Petroleum Code was passed, I was made one of the N. R. A. members on the P. and C. Committee. That means I was one of the Government representatives. Mr. Richberg, Mr. Benedum and myself were appointed by either the President, or the Secretary with the President's approval.

Q. Now, on March 8, 1933, as a committee of one representing the American petroleum industry, did you have a talk concerning crude oil and its products with the President of the United States?

A. I did.

2179 Mr. Chaffetz: That question is objected to. Please don't answer.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Will you tell us the substance of your talk with the President at that time?

Mr. Crawford: That is objected to as incompetent, irrelevant and immaterial.

Mr. Chaffetz: This, as I understand, was early in 1933. Is that the question?

Mr. Donovan: That is right.

Mr. Chaffetz: That is objected to.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Now, your Honor, I will make an offer of proof—

(In absence of jury.)

I make this offer of proof concerning the meeting on March 8th, 1933 between the witness and the President of the United States; and I ask that it be received with the same force and effect as if it were in question and answer form:

If James A. Moffett were permitted to testify, he would testify as follows:

2180 On March 7, 1933, I was appointed a committee of one by the American Petroleum Institute directors to secure a conference with President Roosevelt and to present to him a resolution adopted by the Board of Directors of the American Petroleum Institute, an organization in which almost all defendants here are members, and to discuss generally with him the plight of the industry.

An appointment for conference was granted, and on March 8, 1933, at 12:30 p. m., I saw the President at the White House, presented to him the resolution, and discussed with him generally the petroleum industry's situation.

The resolution dealt mainly with the existing over-production, production of hot oil which was in excess of the existing consumption; the fact that, due to this over-production, price levels had dropped to a ruinously low level, unemployment had increased, wages had decreased, and the general financial structure of the industry had been weakened. The resolution also recommended that a fixed daily allowable be established for the United States as a whole, and suggested daily allowables for the individual States. It was pointed out that the existing posted price for crude oil was 50¢ a barrel.

2181 The President stated that the situation was similar to the wheat situation, and that we should have a price of $1.00 per barrel. The President asked what effect this would have on the gasoline price structure.

I stated that the existing wholesale price for cargo lots in United States Gulf ports was approximately 4¼¢ a gallon, and to support a crude level of $1.00 per barrel would require approximately a 6¢ to 6¼¢ price at the United States Gulf, or an advance of roughly 2¢ a gallon.

The President stated to me that this was not an excessive advance or price. I pointed out that the only exhaustive study of producing costs for the United States that I knew of was the study made by the Tariff Commission Report of 1930 and 1931, which showed that crude oil east of the Rockies cost approximately $1.15 per barrel at the well, and this did not include all accounting costs.

In the general discussion of prices for crude and its products, I reminded the President that when he was Assistant Secretary of the Navy during the World War and I was Secretary of the National Petroleum War Service Committee and a member 2182 of the Committee on Allocation of Petroleum Supplies of the United States Fuel Administration, that the industry had established a price schedule of crude oil and its products, used for the United States forces and its Allies, and that this price schedule had been accepted and had had the approval of all Government agencies during the War. After our discussion, the President called his secretary, Colonel McIntyre, and asked him to arrange an appointment with Secretary Ickes for me immediately, as the President was anxious to have me discuss this general situation with Secretary Ickes before the Cabinet meeting which would be held at 2 o'clock that afternoon.

I went to Secretary Ickes' office and went over the whole situation with him, of my talk with the President. I was informed by him that afternoon, after the Cabinet meeting, that a conference of the Governors of the principal oil producing states had been called for the end of the month in Washington.

After receiving information from Secretary Ickes that notice of the Governors' Conference had been 2183 sent out, I returned to New York and reported to the officers and directors of the American Petroleum Institute the nature of the conference, its outcome, and specifically that the President had suggested that the industry should have $1.00 crude; that he did not consider the supporting price of approximately 6¢ for gasoline excessive; and that the Governors' Conference had been called to consider the general question of daily production in the United States, and suggested allocation for the individual States.

To my knowledge, this information that I communicated to the National Petroleum Institute became a matter of general knowledge in the industry.

Mr. Chaffetz: This offer of proof is objected to for the reasons previously stated.

The Court: Objection sustained.

Mr. Donovan: I understand, your Honor, we have an exception?

The Court: Yes.

(In presence of jury.)

By Mr. Donovan

At some time in September, 1933, together with 2184 Secretary Ickes and members of the P. A. B. and the P. and C. Committee, I attended a conference with the President of the United States.

Q. And do you know who were present at that conference?

Mr. Chaffetz: That is objected to. It might be prejudicial and couldn't have any bearing on the issues in this case, September, 1933.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. At this conference, was there any discussion regarding the price of crude oil and of petroleum products?

Mr. Lewin: Now, I object to that. That is leading and I thought he had said he wasn't going to ask leading questions here.

Mr. Chaffetz: Objected to because it is incompetent, irrelevant and immaterial, also.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Now, I desire to make an offer of proof, your Honor.

(In absence of jury.)

I make this offer of proof and ask that it be received with the same force and effect as if it were in question and answer form:

If James A. Moffett were permitted to testify, he would testify as follows:

2185 On September 26th, I had a conference with President Roosevelt, at which Secretary Ickes, Messrs. Margold, Fahy, Meyers, and Marshall of the Petroleum Administrative Board, Mr. Benedum and myself as representatives of the Government of the P. and C. Committee, and Messrs. Dawes, Beaty, Kingsbury and Franklin, representing the industry on the P. and C. Committee, were present.

By September 26, 1933, Section 9(c) of the N. I. R. A. was in operation, and crude production had been shut back. In order to compensate for this shut back, and in order to increase employment and wages, there was a desire to get the price of petroleum products higher. It was thought that the way to increase prices of petroleum products was for the Government to establish minimum prices.

The Secretary of the Interior, as Administrator, felt that, since he only had this delegated power of the President, the President himself should decide whether or not minimum prices should be established for petroleum products. The purpose of this conference was to outline the problems to the President.

I went to the conference with a figure of $1.10
2186 worked out as the minimum price which should be established for crude oil. The price at that time was 90¢, but I felt, and the others present felt that a price of 90¢ would not cover the situation, that such a price would not cover the cost of production.

The President indicated a willingness to approve the fixing of minimum prices. Everyone present at this meeting felt that the price of crude oil should be at least $1.00. The decision as to the exact price was left to the Administrator, Mr. Ickes. The President told the Administrator to proceed with further investigation, and draw up minimum price schedules.

The industry generally knew of this conference with President Roosevelt, and was informed of the discussion which had taken place, and of the attitude of the Petroleum Administrator.

Mr. Chaffetz: This offer of proof is objected to, for the reasons previously stated.

The Court: Objection sustained. Exception allowed.

(Thereupon the jury were returned into the courtroom.)

2187 Mr. Donovan: Q. Now, on September 26, 1933, did you have a talk with Mr. Arnott?

Mr. Chaffetz: That is objected to. Any talk he may have had with Mr. Arnott in September, 1933, two years before this alleged conspiracy started, couldn't have any bearing on this case. I don't know what that talk was, but I think obviously it isn't—

The Court: You may answer that yes or no.

A. Yes.

Mr. Donovan: Q. Will you tell us what that talk was?

Mr. Chaffetz: Objected to for the same reasons I have just stated.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Can you tell us what that talk related to?

Mr. Chaffetz: Objected to no matter what it relates to. It couldn't have any bearing on the issues in this case.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: I would like to offer proof on that.

The Court: You may offer proof on that.

(In absence of jury.)

2188 Mr. Donovan: I make offer of proof and ask that it be received with the same force and effect as if in question and answer form. I offer it, as on previous occasions, specifically as to each part and as to the whole.

The Court: It may be so received.

Mr. Donovan: This is an offer of proof concerning the talk with Mr. Arnott.

If Mr. Moffett were permitted to testify, he would testify as follows:

> After the White House conference of September 26, 1933, and having been advised by Mr. M. L. Benedum, one Government representative on the Planning and Coordination Committee, that Secretary Ickes desired that the price of crude oil go up, I talked with Mr. C. E. Arnott regarding certain sections, particularly in the Middle West, where certain local price wars and price competition had brought the level of gasoline prices below a cost recovery point on the basis of the posted price of $1.00 crude, and asked him if he could not contact these marketing people where this situation existed and have this cut-throat price competition eliminated and the structure restored to its natural, normal level.

2189 I assume that is objected to?

Mr. Crawford: Objected to as incompetent, immaterial, and irrelevant.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: As to all other offers of proof that I have made, as I stated previously, there, that in my exceptions I hope your Honor will permit your ruling to stand that this kind of exception would be applied, that it would apply, as your Honor ruled, as to each specific question and each specific matter.

The Court: Let the record show that the offer of proof you have made has been overruled, and you may have an exception.

Mr. Donovan: As to each particular part, your Honor.

The Court: Yes.

(In presence of jury.)

On October 7, 1933, I had a conference with President Roosevelt.

Mr. Donovan: Q. Can you tell us who were present at that conference?

Mr. Chaffetz: That is objected to. Immaterial, incompetent, and irrelevant.

The Court: Objection sustained. Exception allowed.

2190 Mr. Donovan: Q. Can you tell us what was the subject of the discussion at that conference?

Mr. Chaffetz: That is objected to. No matter what the subject was, it can't have any bearing on this case.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Then, I must make my offer now.

(In absence of jury.)

Mr. Donovan: I now make an offer of proof concerning the conference of October 7, 1933, at the White House. I make this offer of proof, your Honor, and ask that it be received with the same force and effect as if it were in question and answer form, and offer it specifically and as a whole.

If James A. Moffett were permitted to testify, he would testify as follows:

> On October 7, 1933, I had a conference with President Roosevelt at which Messrs. Benedum and Beaty and myself, representing the Planning and Coordination Committee, and Administrator Ickes, accompanied by Messrs. Margold, Swanson and Meyers of the Petroleum Administrative Board, were present.
>
> 2191 After the price of crude oil went up to $1.00 a barrel a general price schedule for all products based on $1,11 crude, which was 11¢ above the then price, was worked out or attempted to be worked out, covering basic prices at various refinery points throughout the country. This conference was called for the purpose of discussing the schedules as had been worked out. Mr. Margold raised some question about price fixing in connection with the Code, but the President left the matter of price fixing largely to the Administrator to work out.
>
> At this conference the President stated that we had price fixing during the World War and found it satisfactory, and he thought we had no assurance of either $1.00 crude or a price higher than that unless the refined products brought a cost recovery return. There was some discussion at this conference that since the price of crude had been settled to some extent, that the remainder of the price structure of the petroleum industry would work itself out. I recall,

however, that the President favored the adoption of minimum prices for petroleum products. Under the schedules as worked out at that time and based upon $1.11 crude, the price for gasoline 2192 was to be 6½¢ in order to establish a proper parity or relationship between the two.

Soon after this conference, schedules of minimum prices for petroleum products were made public by order of Secretary Ickes.

A report of this conference was made to the P. and C. Committee, and afterwards came to be a matter of general knowledge throughout the industry.

Mr. Crawford: Objected to as incompetent, immaterial and irrelevant.

The Court: Objection sustained.

Mr. Donovan: May we have the same exceptions, your Honor?

The Court: Yes.

No Cross-Examination.

2193 SAMUEL W. EVERETT, a witness for the defendants, testified as follows:

Direct Examination by Mr. Wood.

My residence is Valhalla, New York. I have been chief statistician for Sinclair Refining Company since June 1930, and have been in accounting or statistical work for 30 years. I have had prepared under my supervision a tabulation of figures and also a chart showing the total gasoline requirements, production, purchases, and inventories of gasoline of Sinclair Refining Company for the years 1931 to 1936, inclusive. Those figures on the tabulation and chart were obtained from the regular records and books of the company.

(Chart referred to received in evidence as EXHIBIT 878.)

(The witness then described to the jury the form of the chart, Exhibit 878.)

The gasoline requirements of the company are the sum of the sales of gasoline made during the year, plus the amount of gasoline consumed by the company itself in its own operations.

The column representing inventory at the close of the year is in reality the gasoline available to meet the demands in the succeeding year as represented by the blue column. The first column is the gasoline in storage at the
beginning of 1932. The gasoline that is included in the
inventory figures that I have depicted is all finished
2194 gasoline at all bulk plants, service stations, refineries,
terminals, and in transit. In other words, it represents the complete stock of unsold finished gasoline in the possession of the company, anywhere, at the end of the year.

The total gasoline requirements of the company in 1931, the blue column, is 907,000,000 gallons. During that year Sinclair Refining Company manufactured 849,000,000 gallons. That is shown by the red column. The relation between requirements, or demand, and manufacture, is the difference in the height of those two columns. During 1931 Sinclair Refining Company's total purchases of gasoline, shown by the yellow column, were about 75,000,000 gallons. This was purchased in addition to the production shown by the red column, in order to meet the demand shown by the blue column.

Then at the end of the year, the green column on that chart represents the amount of gasoline in storage to be carried over into the next year, 1932. There were 98,000,000 gallons of gasoline in storage or in the possession of the company, in all places, at the end of the year. So that, in 1932, to meet the demands shown by the blue column, we start off with the inventory shown by the green column on the left-hand side, representing some 98,000,000 gallons.

The total gasoline requirement of the company in 1932,
as shown by the second blue column, was 880,000,000
2195 gallons. During that year Sinclair Refining Company
manufactured 819,000,000 gallons of gasoline to fill this demand of 880,000,000. That is shown by the red column. During that year, to supplement its production, it purchased 73,000,000 gallons of gasoline. That is shown by the second of the yellow columns. What it had left in storage at the close of the year is represented by the second of the green columns. That was 109,000,000. That is more than it had had in 1931.

It went into 1933 with that amount of gasoline in storage. The third blue column shows the total requirements or demand for gasoline of the company in 1933; that was 965,000,000 gallons, substantially more than it had been in either 1931 or 1932. The company manufactured 924,000,-

000 gallons of gasoline during that year to meet that demand, materially less, as shown by the chart, than the total requirements. It bought 67,000,000 gallons of gasoline. That is shown by the third yellow column.

At the end of that year, and to go into the succeeding year, it had left in storage the amount shown by the third green column; that was 135,000,000 gallons.

Then in 1934, the total requirements, sales and plant consumption, as shown by the fourth blue column, were 1,041,000,000 gallons. That is substantially more than it had been in any of the preceding years. 928,000,000 gallons
were manufactured by the company. To supplement
2196 that, and in order to meet the demand represented by
the blue column, we bought 81,000,000 gallons.

At the end of 1934 there were 103,000,000 gallons in the way of inventory or stock with which to go into the next year. That is the amount of gasoline we had in storage at the beginning of the year 1935.

We look at the blue column to see the demand or requirements for the calendar year of 1935. That amounted to 1,162,000,000 gallons during the course of the year, as total requirements or demand for 1935. Roughly, that was 125,000,000 gallons in excess of the total requirements for 1934, and 254,000,000 gallons in excess of the demand or total requirements for 1931. So that, as shown on the chart itself, the demand in 1935, the total gasoline requirements of Sinclair Refining Company during that year, was largely in excess of what it had been in any one of the 4 preceding years.

At the end of 1934, the inventory position of the company was 103,000,000 gallons. At the beginning of 1934, there was in inventory 135,000,000, an excess of 32,000,000 gallons over the inventory position at the beginning of 1935. At the beginning of 1933, the inventory was 109,000,000 gallons. At the beginning of 1935 it was 103,000,000. The inventory at the beginning of 1933 exceeded the inventory at the beginning of 1935 by 6,000,000 gallons. The total
requirements or demand for 1935 exceeded the total
2197 requirements or demand for 1933 by 197,000,000 gallons.

To meet this up to date peak demand or requirements of 1935, the company manufactured 1,073,000,000 gallons of gasoline. That is shown by the fifth of the red columns. The relation of the amount which the company itself produced to its total requirements is shown by the difference in the height between the next to the last red column and the next to the last blue column.

The amount of gasoline that the company purchased during 1935 is shown on the chart by the next to the last yellow column; it was 86,000,000 gallons. At the end of the year, 116,000,000 gallons remained in stock to go into the year 1936.

The demand increased in 1936 over 1935. That appears upon the face of the chart itself. The demand or total requirements for 1936 is shown by the last of the blue columns; that is 1,292,000,000 gallons.

1,200,000,000 gallons of gasoline were manufactured by the company during that period, 1936. That is the last red column. Its relation to the demand is represented by the difference in the height of the red column and the blue column. We bought 114,000,000 gallons of gasoline in 1936.

In respect of ~~each of~~ these years, you can visualize the difference between the amount produced and the amount
sold or required in the operations of the company, by
2198 merely looking at the red and blue columns that are
there, side by side.

I have made a calculation or tabulation, from the company records kept under my supervision, showing the percentage of total requirements represented by the gasoline produced by the company in each of these years.

(Tabulation referred to received in evidence as EXHIBIT 879.)

In 1931, the production to requirements was 93.59%. In 1932, 93.03%. In 1933, 95.80%. In 1934, 89.16%. In 1935, 93.76%. In 1936, 92.83%.

In 1931, purchases to requirements were 8.31%; in 1932, 8.28%; in 1933, 6.92%; in 1934, 7.77%; in 1935, 7.39%; and in 1936, 8.84%.

As to the inventory on hand at the beginning of each of these years, in 1931 there were 38 days' supply; in 1932, 55 days' supply; in 1933, 43 days' supply; and in 1934, 57 days' supply. The average number of days' supply in each of the 4 years preceding 1935, at the beginning of the year, was 49 days. At the beginning of 1935, the number of days' supply on hand was 40 days. At the beginning of 1936, there was 43 days' supply on hand.

The per cent of inventory to requirements for the year 1931, was 10.81; for 1932, 12.44; for 1933, 14.07; for 1934, 9.97; for 1935, 10.01; and for 1936, 10.74.

In order to arrive at the total requirements, you
2199 must add the aggregate sales and the plant consump-
tion, and that addition has not been made on the sheet itself.

Cross-Examination by Mr. Chaffetz.

We determine days' supply by taking the inventory at the last of the year or the first of the year, which is one and the same, taking the inventory December 31, and basing it against January in this way: Divide the total requirements for January by the number of days, and then use the result as the divisor against the amount on hand in inventory.

2200 G. C. LILLY, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Wilmette, Illinois. I am and have been since August, 1916, employed in the capacity of secretary by Johnson Oil Refining Company, an independent refiner, with general offices in Chicago and refinery at Cleveland, Oklahoma.

During 1934, 1935 and 1936, Johnson Oil Refining Company sold gasoline to jobbers in the Mid-Continent or Mid-Western area; and it does so now. It did not sell any gasoline during those years to any of the major companies who are defendants. It also distributes gasoline through its own stations; it has a few stations in and near Madison.

From 1934 to 1936 inclusive, I kept and am familiar with regular records of the company's production and sales of gasoline by months. I have prepared a statement showing those figures by months. My record opens with June, 1934, because in the limited time I had to prepare I was unable to refer to prior records in remote storage.

Exhibit 880 for identification gives the figures of the monthly gasoline production for the last 7 months of 1934, and all of 1935 and 1936.

(Document referred to is received in evidence as EXHIBIT 880.)

Exhibit 881 for identification is a tabulation of the
2201 monthly gasoline shipments or sales during the last 7 months of 1934 and all of 1935 and 1936.

(Document referred to is received in evidence as EXHIBIT 881.)

(The witness then stated the gasoline production and sales figures of his company for the first 7 months of 1934, and all of 1935 and 1936. Such statement is omitted because such figures appear on the face of Exhibits 880 and 881.)

No Cross-Examination

2202 JOHN D. BRIGHT, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I live in Vernon, Texas. I have been employed for 7 years in the capacity of chief accountant by Waggoner Refining Company, an independent refiner that sells in the Mid-Western area. Its refinery is located near Electra, Texas.

I prepared a tabulation from the regular records I kept, showing the company's production and sales of gasoline by months during the years 1934 to 1936, both inclusive.

(Tabulation referred to is received in evidence as EXHIBIT 882.)

(The witness then stated the gasoline production and sales figures of his company for the years 1935 and 1936. Such statement is omitted because such figures appear on the face of Exhibit 882.)

No Cross-Examination

2203 CREED B. BATSON, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Tulsa, Oklahoma. I am employed by Mid-Continent Petroleum Corporation. In 1935 and 1936 I was price clerk in its shipping department, and handled tank car orders for gasoline received from the company's different division offices. All tank car orders for gasoline sold by the company passed through the Tulsa office, where I was employed, and the tank car invoices for gasoline were handled and made up through our office. After the invoices and orders are filled, they are filed in our department.

I have prepared a tabulation showing all gasoline sales by Mid-Continent Petroleum Corporation during 1935 and 1936, other than sales made under contract.

> (The witness then described how he prepared such tabulation and the records from which the figures on the tabulation were taken.)

This tabulation shows the price which appeared on the shipping order. If any of these sales were on the low of the Chicago Journal of Commerce, date of shipment, that would show on my tabulation. My tabulation shows the shipment was made f.o.b. the shipping point. These sales are sales to consumers. I ascertained whether these customers to whom sales were made were consumers or whether they were jobbers by checking with our sales department, 2204 who are familiar with the customer and the type of business. I have that tabulation.

> (Tabulation referred to is received in evidence as EXHIBIT 883.)

No Cross-Examination

2205 **ROBERT W. McDOWELL**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am a defendant in this case. I am 41. I was connected with Mid-Continent Petroleum Corporation during 1935 and 1936 as vice president in charge of marketing.

After first being with an independent refiner, Producers & Refiners Corporation at Tulsa, Oklahoma, and then with a large oil jobbing company, Hawkeye Oil Company at Waterloo, Iowa, for 10 years, in 1928 I went with Mid-Continent Petroleum Corporation when it bought the Hawkeye Company. I was made a division manager a little later on at Waterloo. About 6 or 7 months later I was called to Tulsa to take the position of sort of assistant to D. W. Moffett, who was then vice president in charge of sales. After his death, I became vice president with complete charge of all of the sales and marketing activities of the company, both domestic and export, wholesale and retail.

I have been with Mid-Continent Petroleum Corporation between 9 and 10 years. I have been vice president about 7 years. I am not a member of its board of directors. My office is at the principal office of Mid-Continent Petroleum Corporation in Tulsa, Oklahoma.

2206 Beginning in June and July, 1933, I took part in the drafting of the Code of Fair Competition for the Petroleum Industry of the National Industrial Recovery Act. I was interested primarily in the marketing section of the proposed Code at that time. I attended all of the preliminary meetings in the Middle West, during which the Code was being discussed pro and con by the entire industry of the Middle West. In late July, after the industry had pretty well decided what it would like to have in the Code, certain committees went to Washington and presented this draft of the Code to Hugh Johnson. I attended most of the conferences in Washington connected with the final preparation of the draft of the Code. That Code was finally signed by the President, I believe, in August, and it became effective early in September, 1933.

The objectives of the Code, as I understood them, were to enable the petroleum industry to take its part along with all industry in the rehabilitation of the country under the N.I.R.A., and the specific objectives of the Petroleum Code were to stabilize the prices within the industry, to bring about fair marketing practices, to place proper controls upon production so that we might have conservation, all to the end that higher wages and shorter hours could be put into force by the people in the industry.

2207 After the Code went into effect, I took part in its administration. Under the Planning and Coordination Committee there was a Marketing Sub-Committee that operated in or out of Washington. Then, the country was divided up into districts, and these were called Regions, and there were Regional Marketing Committees. Under the Regional Committees there were State Committees, and County Committees, and sometimes committees in some of the larger cities. I was a member of 2 different Regional Committees: Region 3, which comprised generally the so-called Standard of Indiana territory, which is the Mid-Western area; and Region No. 4, which was comprised of Oklahoma, Arkansas and Texas.

From 40% to 50% of my time was taken up with the discussion of the Code and with Code work from June, 1933 to May 27, 1935. While I was devoting that part of my time to Code activity, Mid-Continent Petroleum Corporation continued to pay my salary as vice president. That was, I am sure, the general practice with respect to other oil company executives who were doing similar Code work.

In the course of my work with the Code, in January, February and the early part of 1935, I knew the conditions of the small independent refiner in the Mid-Continent area quite well. The independent refiner had been in a very bad way financially for some time. He was 2208 caught between the price of crude oil, which was pegged at $1.00 a barrel, and the competition in the market of gasoline made from hot oil from East Texas, which was put on the market at prices 1½¢ or 2¢ under the price for which any refiner operating on legal market price crude could afford to sell it. This had been going on for months, with very short intervals of improvement; so that many independent refiners had either gone broke or were closed down. The independent refiner just couldn't get enough money out of his gasoline to pay for his crude. The independent refiner had to pay $1.00 for crude, and he wasn't getting $1.00 out of the products that he made from that barrel of crude.

The price wars of 1934 had further aggravated the independent refiner's position, because the independent refiner had customers among the jobbers of the Middle West; and when we had these bad local price wars, the independent refiner was confronted with making even a lower price than the regular going market, in order to try to keep his jobber customers alive. If he didn't or couldn't do that, then he ran the danger of losing this jobber as a customer. So that, in addition to losing money, he was confronted with the situation, because of the retail price wars, that caused him actually to lose a lot of his customers.

Then there was another factor that affected all 2209 of us, and that is this hot gasoline that came out of East Texas at such ridiculously cheap prices. The customers of major companies as well as the customers of independent companies, even though they were under contract, would buy that cheaper gasoline because it was so cheap, and that, of course, affected the volume of business that we were doing.

The retail price wars were raging all through the Middle West here. It is just like a fire; it starts in one place, and it doesn't get very far for a while, and then it will spread over into another town. The price wars started in July or August, 1934, and reached their peak in October and November. At that time the retail price situation through the Middle West was terrible. There were prices as much as 5¢ and 6¢ below so-called normal.

Mr. Chaffetz: We ask that the witness' testimony with respect to retail price wars be stricken, because it is a period that antedates the alleged conspiracy, and can't have any bearing on the issues in this case.

The Court: That was in July to October—

Mr. Chaffetz: July to October, 1934.

The Court: Q. How long did they continue? You say the peak was reached in October or November, 1934?

2210 A. It was pretty well cleaned up in December, your Honor.

Mr. Chaffetz: I renew my motion that the testimony be stricken.

The Court: That may be stricken.

Mr. Donovan: And I may have an exception to that?

The Court: Yes, you may.

Due to this competition of much lower priced material in January, February and March, 1935, the independent refiner of our area who was operating on legally produced crude had lost a lot of his customers. So that he was having to dump a certain amount of his monthly production into the market as distress gasoline. Distress gasoline is that part of any company's manufacture that it has no regular sales outlets for, and that it must sell at prices substantially below the market. Not very many independent refiners could store this gasoline until they could get a better price, because they had neither the storage nor the money to finance the storing of large quantities of gasoline. And you know, crude oil has to be paid for twice a month.

The main market for the gasoline outlet of the independent refiners of the Mid-Continent area was jobbers and consumers of the Middle West, in this so-called Standard of Indiana territory.

2211 The condition I have described was the condition of the independent refiner in the Mid-Continent area at the time that I was invited to attend a meeting in Chicago, called by Mr. Arnott, in January, 1935.

(Chart of P. and C. Committee organization received in evidence as EXHIBIT 827.)

Starting in late September, 1934, there were several stabilization meetings of marketers held by Mr. Arnott with reference to stabilizing the retail prices. The retail prices where this price war existed and other things were taken up at these meetings. September 20 or 21 was the first meeting as a result of Mr. Ickes' letter, Exhibit 891 for identification. I was invited by Mr. Arnott to that meeting. This meeting called by Mr. Arnott in September was a meeting of the Stabilization Committee.

I attended these stabilization meetings. The meeting in

March, 1935 was a meeting of the Tank Car Stabilization Committee which was appointed at a meeting in January, 1935 of the general stabilization meeting.

Mr. Arnott is a defendant in this case. He held many positions at the time of the September 1934 meeting. He was vice president or president of Socony-Vacuum Oil Company, a member of the P. and C. Committee, chairman of the Marketing Sub-Committee of the P. and C. Committee, and he was known as Chief Stabilizer in
2212 all our activities as a result of Mr. Ickes' letter of July 20, 1934.

I attended a meeting at Mr. Arnott's invitation on January 4, 1935, in Chicago. There were 40 or 50 members of the industry present. I have a list of those I remember who were present. There was Mr. Adams and Mr. Reeser of the Barnsdall Company. Mr. Merritt of Cities Service. Mr. Karstedt and Mr. Wood of Continental Oil Company. I will try to state whether or not each man is a defendant in this case. Mr. Reeser is a defendant. Mr. Karstedt is a defendant, but I understand he is not on trial. Then there was Mr. Majewski and Mr. Carthaus, of Deep Rock. Mr. Majewski is a defendant, but not on trial. There was Mr. Miskell of Empire Oil & Refining. Mr. O'Shaughnessy of Globe. He is a defendant. Mr. Johnson of Gulf Refining Company. Mr. Carpenter and Mr. Stover of Lincoln Oil Refining Company, a subsidiary of Ohio Oil Company. Its refinery is located at Lawrenceville, Illinois, and its executive headquarters are at Findley, Ohio. Mr. Ashton of Lubrite Division of Socony-Vacuum. He is a defendant. Mr. McKay of Marathon Oil Company. Mr. Smith of National Refining Company. Mr. Hughes, Mr. Gardner and Mr. Moon of Phillips Petroleum. Mr. Hughes and Mr. Gardner are both defendants, I believe. Mr. Snyder
2213 and Mr. McElroy of Pure. Mr. McElroy is a defendant. Mr. van Eeghen and Mr. Lakin of Shell. Mr. Lakin is a defendant. Mr. Sus of Sinclair. Mr. Atkins and Mr. Skelly of Skelly Oil Company. Mr. Skelly is a defendant. Mr. Arnott and Mr. C. L. Jones of Socony-Vacuum. Both are defendants. Mr. Bullock, Mr. Ball, Mr. Jackson and Mr. Lewis of Standard of Indiana. Mr. Bullock and Mr. Jackson are defendants. Mr. Hu[illegible]rey of Standard of Nebraska. Mr. Wright of The Texas Company. Mr. Warner of Tide Water. He is a defendant. Mr. Maguire and Mr. Peters of Wadhams Oil. Mr. Maguire is a defendant. Mr. Marcell and Mr. Mering of White Eagle division of Socony-Vacuum. And Mr. Coffin of White Star division of Socony-Vacuum.

There were 16 defendants at that meeting, and there were others present besides these 39 I have named. I can't just remember who they were.

At that meeting there was a committee appointed that was called the Tank Car Stabilization Committee.

Mr. Arnott, the chairman, opened the meeting. He stated that the meeting was called to consider various problems of general stabilization. He pointed out that during the past month or so many local price wars had been relieved by the work of the Stabilization Committee in line with and as a result of Mr. Ickes' request to him. Mr. Arnott complimented the group there for the cooperation that had 2214 been given. He stated, however, that he and others felt that all of this improvement, which had been brought about in the retail price structure through either the elimination or improvement in these local price wars, would go for naught unless another factor was considered, and that was in the influx of cheap gasoline into the territory, which continued to tend to undermine the retail price structures, even after they had been improved. He stated that Washington had been deluged with complaints from independent refiners about their plight and the competition that they were receiving from hot gasoline and cheap gasoline. He also referred very briefly to a telegram that he had just recently received from a group of refiners down in the Southwest, in which they demanded that some action be taken through stabilization to relieve their terrible plight of having to sell gasoline at these very low prices and having to dump gasoline because of the loss of their business through other channels.

Mr. Arnott stated that it was his opinion, and the opinion of many people in Washington, that unless something was done to bring about a parity between crude and gasoline prices, that crude would probably have to be cut. He said that no one wanted to see crude cut, and he felt this Stabilization Committee should try to do something con-2215 structive rather than to see a crude cut forced upon the producer. Mr. Arnott said the Code authorities in Washington, the Administration, P. and C. Committee, and Petroleum Administrative Board all wanted to see a parity brought about between gasoline and crude prices.

There was a general discussion provoked by Mr. Arnott's remarks. Following his speech, the only thing in particular I remember was a speech that Mr. Majewski of Deep Rock made. Mr. Majewski said he wanted to speak for the group of 20 or 25 independent refiners that he and Mr. O'Shaughnessy had been representing in all stabilization efforts. He said that these refiners were going broke, and that something had to be done. He pointed out that they were having to pay $1.00 for crude, and that they were selling their gasoline way below cost. He stated that under the Code there was a formula that involved the refining industry's getting 5½¢ for gasoline when crude was at $1.00 a barrel.

Mr. Majewski said a lot of things, but I will just shorten it. He wound up by saying that unless something was done, this group of independent refiners was going to be forced to either close down and throw people out of work, or withdraw from Code activities so that they would no longer have to pay Code wages and adhere to Code hours. Furthermore, as a last resort, they would unite to try to cut the price of crude oil.

2216 Mr. O'Shaughnessy was president of Globe Oil & Refining Company and a member of the P. and C. Committee. Mr. Majewski was a member of the P. and C. Committee. Mr. O'Shaughnessy is a defendant in this case and is on trial here.

Mr. O'Shaughnessy simply supported Mr. Majewski's remarks and said that he felt that Mr. Arnott, Chief Stabilizer, should take some action.

I made a brief statement at this meeting in which I said that I felt we all realized the plight of the independent refiner and that something should be done, if a way could be found to bring about an improvement in the situation. There was a general discussion by a lot of people there, but I don't remember the details.

Mr. Majewski made another short speech, in which he stated that from all the discussions it seemed obvious to him that everyone realized that if we were going to have general stabilization in retail markets, we must have some sort of a firm market in the tank car market, and, so that something might be done, he recommended to the chairman that a committee be appointed to study this situation. I don't think there was any debate on this motion to appoint such a committee.

When the motion was passed, the Chairman, Mr. Arnott, stated that he would appoint the committee before the meeting was over. Later in the day he appointed the committee composed of Mr. Ashton as vice-chairman, Mr. van Eeghen, Mr. Karstedt, Mr. Hughes, Mr. Miskell, Mr. Bullock, O'Shaughnessy, and myself, as chairman. I tried to stay off the committee, as I had too many other things to do. Several of those there prevailed upon me

2217

that it was something that should be done, and they felt that I should serve, and I did.

When Mr. Arnott appointed this committee, he simply charged us with the job of making a study of the tank car market situation in the Middle West, and reporting back to him.

I have seen the letter of July 20, 1934, as a result of which this meeting was called. I first received knowledge of that letter by reading about it in the trade papers, right after it was written. Shortly thereafter, Mr. Miskell of the Empire Company, in Tulsa, who was chairman of the Regional Marketing Committee of Region 4, Oklahoma, Arkansas and Texas, showed me a copy of the letter. That was the first time I had ever seen it. When he called that letter to my attention, he called another paper to my attention. There was a memorandum attached to the letter, which was an opinion by a Mr. Titus, who was general counsel for the P. and C. Committee.

Q. Now, I show you a letter dated July 20, 1934, addressed to Mr. C. E. Arnott, Chairman, Marketing 2218 Division, Planning and Coordination Committee, Investment Building, Washington, D. C. signed by Harold L. Ickes, Administrator, Petroleum Industry, and ask you if that is the letter that you referred to, that Mr. Miskell showed you?

A. Yes, sir, that is the letter.

Q. Did you read that letter at that time?

A. I did.

Q. Did you believe that that letter authorized Mr. Arnott to do the things decided in that—

Mr. Lewin: I object to that. That is the most leading question I have ever heard addressed to a defendant on the witness stand.

The Court: You may answer that.

A. Yes, sir, I did.

(Letter of July 20, 1934, referred to marked Exhibit 891 for identification.)

The Court: Do you want to be heard on this?

Mr. Chaffetz: Yes, your Honor.

The Court: The jury may retire.

(Whereupon the jury left the court room, and the following proceedings were had out of the hearing and presence of the jury:)

Mr. Chaffetz: Are you about to offer this?

Mr. Donovan: I am not going to offer it right away. I am going to offer it in a few minutes. We haven't completed the basis for the offer of Exhibit 2219 891 for identification at this time. This witness has testified that he read this letter, shown him by Mr. Miskell, when it first came out; and now I intend to ask him if this letter and the memorandum attached were read at the first meeting held, as a result of these meetings which Mr. Arnott called, following the letter. The witness has already testified that he relied upon this letter as indicating the authority of Mr. Arnott to call these meetings.

We intend to offer that letter for more than one reason: First, because it is part of the res gestae, it is part of the entire transaction; second, because it is one of the elements in the circumstances leading up to the appointment and action of this Tank Car Committee. Third, this witness now says that he believed that letter and relied upon it; and whether the letter conferred authority or not, is a question here, whether he believed it conferred authority or not is a question for the jury. Certainly, he is entitled to have that submitted on the question of his intent. Contemporaneously with the submission of this letter to the witness, a memorandum was submitted which had been prepared, written and sent to Mr. Arnott by the counsel for the P. & C. Committee. 2220

Now this defendant is on the stand and this defendant says that he read this letter, that he read this memorandum written by Mr. Titus, counsel for the P. & C. Committee, and that he relies on them.

Mr. Chaffetz: From the Government's point of view, the only purpose of offering this letter and the witness' testimony that he relied on it, is to show the good faith of the defendants. If we do that, we must go into all the circumstances which would test their good faith.

The Government's position is that anybody reading that letter could see on its face that it did not authorize any such thing as the defendants here are charged with doing.

It is the Court's function to construe the letter; and if, in fact, that letter has no such authority and could not be construed as to suggest authority to deal with the tank car price, then the Court ought to rule that this letter is in any event remote, so far as this case is concerned, and improperly prejudicial, in the way in which the defense proposed to use it.

The Court should rule, that as a matter of law, the defendants should not have believed that that letter gave them authority to do what they are charged with doing.

2221 It is not reasonable to assume that this gentleman would read that letter and think, by that alone, he was authorized to go out and engage in a conspiracy to fix the tank car price of gasoline. Furthermore, this gentleman well knew about buying programs in 1934. He wants to have this jury believe that although this letter was dated July 20, 1934, and although subsequent to that date there was a series of buying programs, not under that letter at all, now, all of a sudden, this letter becomes authority to carry on buying programs without any separate authority from the Secretary of the Interior. It is just plain unreasonable.

(Ruling reserved on offer of Exhibit 891 for identification.)

(The following proceedings were had in the hearing and presence of the jury.)

By the Court

The price wars reached their peak about October, 1934, and they were about over in December, 1934. I attended several stabilization meetings that were called from time to time, some of them being general meetings in Chicago, others being state meetings, and some being local meetings, to treat with various situations.

A trackage operator is a retailer who has bulk storage,
but he does not as a rule sell to other dealers or to
2222 consumers other than through the service station that
he has right at the same point usually where he has his
bulk storage. So that that physical arrangement can be worked out they have to be located on railroad trackage, and that is the way the term "trackage operator" sprang up.

These local price wars started from many, many different causes. No one ever really knew the reason why, in many instances. Sometimes we had operators in these areas who were known as just out and out price cutters, people who always sell under the market. But regardless of how it started, the situation would grow, because if the price of gasoline is down 2¢ or 3¢ in Madison, for example, it is not very long before it will spread out to Portage or Baraboo or some of the other towns closer around, and then unless there is some distance, or some reason for its stopping, it will eventually spread all over the entire state. Local price wars that started in certain areas in the summer and fall of 1934 had spread and spread and spread until you could hardly go into any area of any importance where the price was not cut to some extent.

For several months they attempted to handle the price war trouble locally. But if you get the fire put out at one place, and if you do not handle it over here, then that other one might come back to this one that you had improved.

So during the early part of December, 1934, following a general stabilization meeting at which this terrifically terrible local price situation was discussed from all angles, there was a series of meetings held that lasted all week. The general stabilizer, Mr. Arnott, called in literally thousands of people who came in day by day from the various states. And an attempt was made, and it was reasonably successful, to get all of those local price wars eliminated at one time, on the theory that unless some general improvement was made it would not do any good, because if you leave any important markets down substantially below normal, sooner or later price wars will start to spread again just like a disease. 2223

So during this week, early in December, 1934 the industry, large and small, including major companies and representatives of jobbers' associations and state associations, and representatives of dealers' organizations, had that series of meetings. As a result of that, a very large percentage of those local price disturbances were eliminated, and the retail market structure was much more nearly back to normal, or greatly improved from what it had been for many, many months.

Those local price wars hurt everybody. The jobbers and the dealers were greatly disturbed about them, as were the refiners. Every branch of the industry was disturbed by that situation.

2224 *By Mr. Donovan*

The memorandum dated July 31, 1934, under heading "Planning and Coordination Committee, address memorandum for Mr. Arnott," signed "Louis C. Titus, chairman Legal Committee," is the memorandum to which I referred as having been shown to me by Mr. Miskell.

(Document referred to marked Exhibit 892 for identification.)

There was another occasion when my attention was called to Exhibits 891 and 892 for identification. Shortly after the first general stabilization meeting, called by Mr. Arnott around September 20 or 21, 1934, was opened Mr. Majewski read both the letter from Mr. Ickes and the Titus opinion to the entire meeting. I would say that substantially the same group of people that I mentioned this morning as being present at the January 4 meeting were present at that meeting. The letter was given wide publicity in our trade papers at the time it was written. Everyone in the industry reads the trade papers, I assume.

Mr. Donovan: I offer in evidence, your Honor, the letter of July 20, 1934, EXHIBIT 891 for identification. Now, I offer too, so that we can pass upon the entire question, EXHIBIT 892 for identification, which is the memorandum from Mr. Titus, chairman of the Legal Committee, to Mr. Arnott.

2225 The Court: It is very clear to me that there is nothing ambiguous about that letter at all. The witness has already testified why he attended these meetings and what they were for. He has already told us about what was done, to correct a difficulty that arose in the sections where the price war was on. My view of that letter is very clear, that the authority was limited, to stabilize the prices where the price war was on.

Mr. Lewin: Retail prices, your Honor?

The Court: Retail prices, yes. The objection to that letter is sustained and to the other exhibit.

Mr. Donovan: May I take exceptions to that?

The Court: You may.

By the Court

I have told you in some detail just what was done to eliminate those price wars and the condition brought about by reason of the price wars in certain localities. If I inferred that we had completed that work in December, 1934, I gave you the wrong impression. The condition was greatly improved, as compared with what it had been.

Q. Well, then, tell us just exactly what was done by this Stabilization Committee up to January 1, 1935, to eliminate price wars?

2226 A. Well, that meeting in early December, 1934 that I mentioned, was also the last general meeting of that sort in the year, but when a few weeks following that other price wars started breaking out, as the tank car price weakened early in January—there is always a direct relationship, and the things just go from one to another. Long price wars, for example, cause the suppliers of gasoline who are—

Mr. Chaffetz: That isn't responsive to your Honor's question.

The Court: Q. What I want to know is just what was done.

I didn't tell these men who were selling below the normal price that they would no longer be permitted to receive gas from any major company unless they brought the price up to normal.

Many of the companies had in their contract forms a provision, that was authorized under the Code, which gave us the right to dictate the price at which they resold our merchandise, and it was through those provisions in those contracts that we would use influence on our own suppliers if they were guilty of selling at below market or below cost. At stabilization meetings, other companies would agree to do likewise.

2227 The cooperative influence had to be brought to bear on people who were buying from concerns who had no such provisions in their contracts. Supposing we are supplying a jobber and there are 7 or 8 others in town, and there is a local price war on. We feel that we have to take care of our jobber, as we say, give him local protection, something that wasn't provided for in the contract. That means we reduce our price under what it would have been under the terms of the contract so that he may live.

Some other supplier in that market has to meet that situation. And if that goes on, that affects the man who is selling on the spot market, and drives his price down, because sooner or later they all become competitive.

During the period of the Code, I think the contract that most of the major companies had, contained a provision that permitted them to dictate to the retailer just what price he should sell the gasoline at. I know it was in ours and many others. We quoted a clause that was in the Petroleum Code which gave us the legal option to direct the price and name the price at which the retailer would sell, which we could exercise if we so desired.

I was asked a moment ago something about the intensity of this local price disturbance. I am afraid

2228 I gave the impression that we did not have it after 1934. We did, of course.

By Mr. Donovan

There were some price wars in every month in 1935, but it didn't get to the general, territorially wide intensity that it had in 1934. That was what Mr. Arnott was undertaking to prevent. On January 4, 1935, on or about that time, there were price wars in existence in the Mid-Continent territory.

At this meeting on January 4th statements were made as to the proper manner of dealing with or preventing these price wars. Both Mr. Arnott and Mr. Majewski made the statement that the ground that had been gained in improving this retail situation would be lost unless there was some improvement in the tank car market structure, because of the direct relationship between the two and the effect one had on the other.

By the Court

I know that some major companies had a provision in their contracts during the time the Code was in force, which gave them the right to name the price the retailer would sell at. I don't think any of the small companies ever did that. I couldn't say that all the major companies had that provision. That provision in the contract only took care of a small percentage of the real causes of the price wars during the latter part of
2229 1934.

In order to limit these price wars we held these meetings and tried to persuade these various people that were cutting the price to get their prices up. Sometimes their suppliers were talked to to see if they couldn't use their influence on them, but the small companies, in my opinion, didn't have and didn't exercise influence over their outlets. That was one of our big problems in stabilization.

That was what Mr. Arnott talked about. We were attempting to get the support of the independent refiners for stabilization. And that meant that we wanted them and thought it was proper for them to follow their product through to the market and see that the people distributing their product sold at a fair price and didn't sell below cost. In my opinion, I don't think one out of ten of those people had any control over the distributors of their products at all.

So we were faced with this situation: We had to have their support in general stabilization, and they announced to us at that meeting of January 4th, through their spokesmen, Mr. Majewski and Mr. O'Shaughnessy, that

they weren't going to have any so-called stabilization in the future unless something was done about this tank car price, because they were going broke and
2230 losing their customers.

Mr. Donovan: Now, your Honor, in view of the testimony given, I desire to renew my offer and offer in evidence EXHIBITS 891 and 892 for identification, the letter and the memorandum.

Mr. Lewin: We renew our objections.

The Court: Objection sustained. Exception allowed.

By Mr. Donovan

I have stated what Mr. Arnott and Mr. Majewski gave as their opinion as to what was necessary to be done to correct price wars. As a practical oil man, I certainly agreed with that.

On January 7, 1935, the Panama decision was handed down by the Supreme Court, and knocked out Section 9 (c) of the Code. It made illegal the Tender Board that had been in operation in East Texas. The result of that decision was a great and renewed influx of hot gasoline into this Mid-Western territory with the result the refiners in our own area were confronted with still lower prices to have to compete with, and that started eating into the retail structure.

In January, 1935, distress gasoline had the effect of further weakening our retail markets because of the matter of hot gasoline still coming back into the Mid-Western area out of East Texas. It pushed just that
2231 same amount of gasoline from the independent refiners of Oklahoma and Kansas out of a market, and then made that much more distress gasoline on their hands. They had to sell it some place. They sold it for a lower price than the market, in order to dump it. And then that cheap gasoline in the hands of certain distributors was sold at lower prices, because from a practical standpoint, we have learned over many, many years in the industry that most people who buy at bargain prices can't keep the profit themselves, and they have to give part of it away, and so there we had the retail price trouble starting all over again.

Mr. Donovan: Now, your Honor, in view of this testimony, I must renew my offer of Exhibits 891 and 892.

Mr. Chaffetz: I don't see that this testimony has any bearing on that issue.

The Court: Same objection, I suppose?
Mr. Chaffetz: Same objection.
The Court: Same ruling. Exception allowed.

I have stated that I accepted the position of chairman of the Tank Car Stabilization Committee on January 4, 1935. There was a meeting of that Committee on February 5, 1935. Between the time of the appointment of the Committee and February 5th, I had made two attempts to get the Committee together, one around
2232 January 15 or 16, and one a week later.

In the meantime, between January 4, 1935 and February 5 of that year, an event occurred which affected conditions in the industry. On January 7th this Panama decision had very definitely thrown the industry into a new chaotic condition. Prior to that decision the amount of hot oil moving into our territory had been minimized to a very small amount, because the Federal authorities were regulating and controlling the amount of gasoline and the nature of the gasoline that could be shipped out of East Texas. After the Panama decision, the tank car market went down.

Between the appointment of my Committee on January 4 and the first meeting on February 5, Mr. Arnott called me either once or twice during the latter part of January. He urged me to try to get the Committee together. He told me in the course of at least one of the conversations that the Connally Bill, which had been introduced in Congress very shortly following the Panama decision, had splendid chances of passing, and if it did that would put a tender board into East Texas, and that would help the general situation. He said everyone in Washington was enthusiastic about the possibility of that legislation being passed, and that they were after him to get some activities on the part of this Committee. I told Mr. Arnott that I had been trying to get the Committee
2233 together, but they were pretty busy men, and scattered all over the Middle West, and that I would get them together as soon as I could.

The first meeting of the Tank Car Stabilization Committee was held on February 5, 1935 in Chicago, in Mr. Bullock's office. He is a defendant in this case. All the members of the Tank Car Stabilization Committee were present at that meeting. In addition there were 2 or 3 guests. Mr. Hughes was present. There were others present who were not members of the Tank Car Stabilization Committee. Mr. van Eeghen of Shell brought Mr. Ruether of Shell with him; Mr. O'Shaughnessy brought

Mr. Woodruff with him. Mr. Bourque, secretary of the Western Petroleum Refiners' Association and a defendant in this case, was there. Mr. Ruether and Mr. Woodruff are not defendants in this case.

I called the meeting to order, making a very brief statement about why we were there. I commented briefly upon what had taken place since the Committee was appointed, namely, the further reduction in an already very unsatisfactory price situation, and told them that I hoped we could come to some constructive suggestion to make to Mr. Arnott.

After I spoke, there was a general discussion of the market situation, and of the fact that the market was worse than it had been in January, due to this new 2234 influx of hot gasoline from East Texas. Mr. Ashton spoke. He made the statement that, although he agreed that there was a lot of cheap gasoline coming out of East Texas, he didn't think the situation in the Mid-Continent area was as bad as might be inferred; and he asked Mr. Bourque, who was there, to read a list of independent refiners, and the amount of distress gasoline which they had for the month of February.

Mr. Bourque was secretary of the Western Petroleum Refiners' Association, which is a 25 year old trade association made up of major and independent refiners, primarily in the Mid-Continent area. 80% of the members by number are independents, or small companies. The Western Petroleum Refiners' Association always has carried on statistical work. It gathers data with reference to the production, sales and inventory of its members on all products, and issues bulletins on that information; and then it passes information with reference to national figures on to its membership.

I think Mr. Bourque read the figures off the list. They indicated that the independent refiners on the list had between 600 and 700 cars of distress gasoline for sale during February, 1935. There were a number of questions asked about the detail of those figures. I think Mr. Ashton asked most of them. Mr. Ashton, after asking Mr. Bourque 2235 a few questions, made quite a point of the fact that here were only 600 or 700 cars of distress gasoline, covering the entire month, scattered among some 16 or 17 independent refiners, and that there were some 10 or 12 major companies in that same area who were known to be regular and normal buyers of gasoline.

I think some one immediately suggested: Why not get the major companies to buy this distress gasoline? Some disagreed with that suggestion and it provoked quite an argument. I remember particularly that Mr. Karstedt and Mr. Bullock stated that they didn't think major company buying would do any good, would have any value. They had a good many reasons for that statement, as I remember it.

First, they said that with hot gasoline moving out of East Texas as it was, any buying in the Mid-Continent would be just like mopping up the ocean. They said, furthermore, that they wouldn't have anything to do with any more buying programs; they had had some experience with some in 1934; they didn't think they had done any good; and they just didn't want to have any part in anything that was like the 1934 buying programs.

They said why the 1934 programs hadn't done any good. Hot oil had continued to be uncontrolled during several of those 1934 programs. They also made a very definite 2236 point of this: that they didn't want to have anything to do with anything where there were any allotments or commitments, or where anybody could tell them how much they would have to pay for gasoline. Those were principles of some of the buying programs in 1934. And they expressed the opinion that they thought those were some of the reasons that those plans had failed, because people were being asked to do things that they didn't want to do.

Q. Were those 1934 programs under the Code?

Mr. Chaffetz: That is objected to. He now brings this in by first talking of conversations at these meetings, and then he is going to go back into an entirely new field. I think he should confine himself to conversations at the meeting.

Mr. Donovan: If it please the Court, there is testimony here about the 1934 programs. What were those 1934 programs?

Mr. Lewin: No, now, we didn't object heretofore, because he was talking about conversations taking place at these meetings. We thought that was of doubtful validity, but we didn't object to it. Now, he is going back to those programs in 1934, which open up a number of different cases, and fall directly under your Honor's rulings before.

The Court: Objection sustained. Exception allowed.

2237 As an alternative to the suggestion that was made, Mr. Karstedt and Mr. Bullock said that in their opinion the only thing to do was to have a cut in the price of crude. They didn't think anything else could be done.

I took the position that I didn't agree with the pessimistic attitude of Mr. Karstedt and Mr. Bullock; that, although the situation was fairly bad right at that time, I thought we should be encouraged by the attempts on the part of the Administration to get the Connally Bill passed, which we knew had as one of its purposes the establishment of the Tender Board, which would, we hoped, put a stop to the trafficking of hot oil and hot gasoline out of East Texas. I called their attention to the fact that we were a committee, appointed by Mr. Arnott, representing a section of our industry, and that I thought we should attempt to do something.

I referred to the fact that, under the Code, there was a provision covering a parity between crude and the price of gasoline, and that evidently the Administration didn't want the price of crude cut.

The price of crude at that time was $1.00 per barrel. So I felt we still had a problem to deal with, in this very sub-normal price of gasoline.

Section 6 of Article 3 of the Code provided that crude oil should be 18½ times the price of gasoline; so that, with crude oil pegged at $1.00 a barrel, 2238 we divided $1.00 by 18½ and got a figure that equalled 5 4/10¢ plus per gallon. That referred to the wholesale or tank car price of gasoline at the refinery.

Mr. O'Shaughnessy then said that he certainly felt that I was right, and that the Committee should attempt to do something. He again stated that the group that he was representing in all stabilization activities were desperate and that they had to have some help; and, as an indication of how he felt about it, and how earnestly he felt about it, and what he had been doing, he read to us at that time an exchange of correspondence on the subject of parity between crude and gasoline, that he had had with Mr. Fahy, a member of the Petroleum Administrative Board. I believe he was either chairman or vice-chairman.

The certified copy of a telegram, dated January 28, 1935, from I. A. O'Shaughnessy to Charles Fahy, which you show me, is a copy of the telegram read at that meeting by Mr. O'Shaughnessy. The certified copy of a duplicate original of a letter, dated February 1, 1935, signed by Charles Fahy and sent to I. A. O'Shaughnessy, which you show me, is the letter which I referred to in my testimony as being read by Mr. O'Shaughnessy at this meeting on February 5, 1935.

2239 (Telegram and letter referred to are received in evidence as EXHIBITS 893 and 894, respectively, and read to jury by Mr. Donovan.)

After that letter and telegram were read, Mr. O'Shaughnessy followed up with a few remarks, urging us to take some action. Shortly thereafter Mr. Ashton stated that he thought that was encouraging, and that he felt that he would like to make a suggestion.

At this meeting of February 5th there was a plan of action proposed. Mr. Ashton made a suggestion that became the topic for general conversation. Mr. Ashton said that the plan he would suggest was quite a simple one. He pointed out again that this survey showed about 600 or 700 cars of distress gasoline in the hands of some 15 or 17 independent refiners; on the other hand, there were some 10 or 12 major companies who were known to be regular and normal buyers of gasoline. He thought that if this information of the availability of distress gasoline could be put in the hands of these major companies on an intelligent basis, that it would be a helpful thing for this Committee to do. He further stated that he thought it might be a proper function of this Committee to continue to gather this information from month to month.

There was quite a discussion as a result of that 2240 proposal, but as I remember it, Mr. Karstedt immediately challenged Mr. Ashton's suggestion by stating that if anything of that sort would do any good, why hadn't it accomplished something in the past; that there had been major company buying. He evidently didn't see any significance to Mr. Ashton's remarks. He said that major company buying had taken place in previous years, in 1934. He didn't at that time go into any details as to how it had taken place. He just said there had been this buying, and some of it had been on a very large scale, but he wondered what Mr. Ashton was driving at.

In reply to Mr. Karstedt, Mr. Ashton stated that he felt the manner in which this previous buying had been done was responsible for the failure to accomplish anything. He stated that in the first place he had observed that the major companies followed the line of least resistance in their purchasing, and bought from those companies that they were well acquainted with, with the bet-

ter known and larger of the independent refiners. In many instances, this had resulted in giving those refiners more business than they really needed, so that they had been over-running their Federal allocations; and, on the other hand, this had left some of the smaller and lesser
2241 known independent refiners with distress gasoline to sell.

Mr. Ashton suggested how this could be improved. He said that his suggestion would include the thought that the major companies should consider scattering their purchases around amongst the various independent refiners who had distress gasoline to sell; and that it would be the function of this Committee to make known all of the companies who did have distress gasoline to sell, so that there would be better distribution of the buying.

Mr. Ashton gave further reasons why he thought the previous purchasing had not been helpful. He stated that he also felt that some of the major companies, at least, had allowed their field buyers to chisel on the sellers and take advantage of their economic distress because they needed to sell gasoline, which drove the market down further under an already distressed price. He said he felt that the major companies should consider being willing to pay a fair going market price, rather than chiseling on the small refiners.

Mr. Ashton reflected what had been discussed and stated by many people throughout the morning: that there would be no commitments or no allocations under his plan; that this buying was to be, if there was any buying, in line with the actual needs of the company, and that to this ex-
2242 tent his suggestion differed from several of the 1934
programs, which had included commitments and allocations and fixed prices, and things of that sort. Mr. Ashton just sensed that the attitude of every one there was that they wouldn't have anything to do with a plan following the policy in 1934, and he was trying to suggest a plan that got away from those objectionable features.

After Mr. Ashton had stated the plan, I stated that I thought his plan had some merit. I said that I knew that our company was going to have to buy gasoline, that our inventories were very low, that our allocations had been continually reduced by the Federal allocating agencies, and that I felt that we would be buying gasoline from these independent refiners, or from some independent refiners, and that we would consider such a plan, and that I always felt that we had paid a fair price in our dealings with these refiners.

The Connally Bill was discussed many times during the morning. Mr. Ashton stated that he felt that if the bill were passed and the Federal Tender Board put back into effect, that could assure us that hot gasoline from East Texas would no longer slop over into our market, and that gasoline made from legally produced crude in East Texas would very naturally move into its normal markets, which
we considered to be the southeastern states, the Gulf
2243 Coast, the East Coast and the export market.

I think most of the gentlemen present expressed their opinions on Mr. Ashton's plan, and they all seemed to be favorably impressed with it. Every one there indicated, as I did, that they were going to have to buy gasoline. Some of them stated they were already buying gasoline and had been for some time. As I recall it, most of them indicated that they felt the plan was worthy of consideration, and they saw no reason why they couldn't fit their purchasing into those sorts of suggestions.

I was asked to advise Mr. Arnott of our deliberations, and the plan that we had arrived at.

I think when the list was read off, or some time during the meeting, some of those present made the statement that they had been purchasing in the past from several of the companies on the list, and therefore knew them and knew what their product was. There was nothing definitely stated about buying, however.

After we got through with all this talk pro and con, some one asked Mr. Ashton to sum up just what his suggestion was. Mr. Ashton said that there were to be no pools or
no central buying agencies; that the suggestion would
2244 be that every one buy in line with his needs, and make
his own deals with the selling refiners; second, that there were to be no allocations, no commitments, no percentage quotas, such as there had been in some of the previous plans, but that each company would buy in line with his actual needs; third, that the Committee would urge and suggest to the buying companies that they consider paying a fair going market price in their individual transactions, rather than chiseling down on an already distressed price.

Then Mr. Ashton made the statement, because so much had been said about the East Texas situation, that he thought, in recommending this plan to Mr. Arnott, we should make it very plain that in studying this situation as requested by him, it was our opinion that there were two principal factors having something to do with the depressed

tank car market situation: first, the shipment of hot gasoline out of East Texas, and that until such time as there was Federal legislation that would definitely stop that, we rather felt that the situation was hopeless; and second, there was the continual sale of distress gasoline, or the dumping of gasoline in our own territory, and we felt that that was partially due to this competition from East Texas. We wanted to make it clear to Mr. Arnott that we didn't suggest that the plan be put into operation or consid-
2245 ered until such time as hot gasoline out of East Texas
was definitely stopped as a market factor in our territory.

There was an arrangement made at this time for a future meeting of the Committee. We had already received notice from Mr. Arnott of a general stabilization meeting to be held in Chicago on February 11, so I suggested to the members of my Committee that we attempt to have a meeting following that, because I felt we would all be in Chicago anyhow.

My Committee did not have a secretary. We did not keep any minutes of what occurred at any meeting. We were just discussing a report to be made to Mr. Arnott. We didn't have any power other than suggestion. So there was no reason for keeping any minutes.

I reported the result of the meeting of February 5 to Mr. Arnott within the next day or so. He was down in Pinehurst, I believe. I told him of the plan that had been developed at the meeting. I told him also that I had asked the Committee to reconvene on the 11th after his general Stabilization Committee meeting, and that I assumed we would have an opportunity at that time to talk to him in more detail, but I wanted him to know briefly what our suggested plan was, so that he could be thinking it over.

Between February 5th and February 11th, I did not
2246 do anything to put the plan into effect. I did not have
any further conversation with Mr. Arnott before February 11th.

Mr. Arnott phoned me on the 11th, at Chicago. Something happened, and he didn't come to the general Stabilization Committee meeting. It was held, but he wasn't there. He first told me that he was sorry that he wasn't going to be at the meeting. He stated that he had been giving considerable thought to the suggested plan and that he thought it had a lot of merit. He also told me that he was quite encouraged about the possibility of the passage of the Connally Bill; and he felt that that was almost assured;

and if it was, in his opinion, the hot gasoline situation would be taken care of.

We held a meeting of the Tank Car Stabilization Committee on February 11, 1935, in the evening, following the general Stabilization Committee meeting. It was held in the Blackstone Hotel, Chicago. All the members of the Tank Car Stabilization Committee were present and in addition to them we invited into the meeting several representatives of other major companies who we knew were regular and normal buyers of gasoline but who were not represented on the Committee, and therefore did not know anything about what we had been doing. Those other persons were Mr. Sus of Sinclair; Mr. Atkins
2247 of Skelly Oil Company; Mr. Reeser of Barnsdall;
Mr. McElroy of The Pure Oil Company; and, I believe, Mr. Dippel was there with Mr. Sus of Sinclair Refining Company.

I presided at this meeting. On opening it, I made just a few brief remarks about the Committee's appointment, and why I felt that Mr. Arnott had appointed it. I reviewed briefly the things that had taken place in the industry between the appointment of the Committee and the present time; I told them of the fact that the Committee had had considerable deliberation on this subject, and that we had arrived at a plan that we had recommended to Mr. Arnott, and that we wanted to talk to them about it. I might add that in my discussion that morning with Mr. Arnott I had told him that I would like to do this; and he said to go ahead and explain it to these other people, but to take no action.

I told the meeting of my talk with Mr. Arnott. I told them I had talked to Mr. Arnott that day, and that he had encouraged me to believe that the hot gasoline situation in East Texas would probably be taken care of by the passage of the Connally Bill; he also had authorized me to tell these people that he knew about this plan and thought that it was a good one.

After I opened the meeting, there was a general, rather a pro and con discussion about the general situation,
2248 about buying where they wanted to buy and what
could be done. In order to get down to the thing that we wanted to do, I asked Mr. Ashton to explain the plan that he had suggested to the Committee, and which the Committee had recommended to Mr. Arnott.

At this meeting of February 11, Mr. Ashton outlined the plan for the benefit of those whom we had invited into this Committee meeting. The plan that Mr. Ashton outlined there was identically the same plan he had outlined on February 5th.

There was a general discussion as a result of Mr. Ashton outlining this plan. In the discussion that his explanation provoked, I remember there were a number of people who took the position that they were going to have to buy gasoline; they did not know exactly in what quantities, but it looked like they were going to have to buy considerable gasoline; but that they were not going to be committed to anything; they were not going to be told where they had to buy it or how they should buy it. Mr. Ashton kept coming back to his plan and pointing out that the plan aimed at eliminating all of those objectionable features.

Following that discussion Mr. Ashton made reference to a survey which he had in his pocket, which was very similar to the one that we had discussed at our meeting in Chicago the week previously. We had data or
2249 figures available at that meeting of the current amount of distress gasoline. Mr. Ashton had a survey that had been furnished him by Mr. Bourque. I am sure the survey isn't in existence. It was a list of some 16 or 17 or 18 independent refiners in Oklahoma, Kansas and North Central Texas; and opposite their names it showed a certain number of cars and the grade of gasoline, whether it was third grade or "Q" gasoline; and then, I think, it also showed the Federal allocation that had been given each of these refiners by their district allocating agency.

With that information in his hand, Mr. Ashton stated that he was somewhat encouraged by the general reaction to his suggestion and that he would like to see how it would work out from a practical standpoint. He started around the table and read the names of these refiners off again; and then asked different people if there were any particular concerns there that they would like to consider buying from.

As he went around the table, it developed that some of the companies were already buying. Some of the major companies were already buying from some of the small refiners that were on this list; and in that event they so stated, and said that their relationships had been satisfactory and that they no doubt would continue to buy from those companies. Others stated a prefer
2250 ence for companies, based on many reasons. Some said they were selling crude to them. Most of those

independent refiners have to buy their crude, and some of them were buying crude from some of those major companies. Other major companies had lubricating oil contracts with some of these small companies. Others were selling natural gasoline to the smaller companies. As Mr. Ashton went around the room and asked for this indication from the people, those various factors were developed, and Mr. Ashton made notes, I believe, on this survey. After he had concluded going around the table, prospective buyers had not been found for all the distress gasoline. As I remember it, there were about 7 or 8 of these independent refiners who were unmentioned.

The phrase "dancing partners" came up right there after Mr. Ashton had gone around the room. There were these 7 or 8 small refiners whom no one had mentioned. He said this situation reminded him of the dances that he used to go to when he was a young fellow. He said, "Here we are at a great economic ball." He said, "We have these major companies who have to buy gasoline and are buying gasoline, and they are the strong dancers." And he said, "They have asked certain people to dance with them. They are the better known independent refiners." He said,
2251 "Here are 7 or 8 that no one seems to know." He
said, "They remind me of the wallflowers that always used to be present at those old country dances." He said, "I think it is going to be one of the jobs of this Committee to introduce some of these wallflowers to some of the strong dancers, so that everybody can dance." And from that simile, or whatever you want to call it, the term "dancing partner" arose.

Something was said at this meeting of February 11 about the prices at which purchases should be made. That question was raised several times in the general discussion and by different people, and Mr. Ashton always answered the question by stating that this plan was not a price-fixing plan; there was no basis for the setting of any price; but the plan would suggest that the buying companies be willing to pay a fair going market price for such purchases as they did make.

Nothing was said at this meeting as to how much gasoline would be purchased by any buying company. Many of the men there stated very definitely that although they knew that their companies were buying and that they were going to have to buy, that they were not acquainted with the details and were unable to get into that situation.

2252 Something was said at this meeting about the Connally Act. I had mentioned it in my opening remarks. I told them of Mr. Arnott's advise to me about it and his feeling that it would be passed. Mr. Ashton made it very plain that this plan was not recommended for operation until the Connally Act or some other legislation was passed that would definitely put a stop to hot gasoline slopping over into the Mid-Continent territory.

Something was said at this meeting about publicity. Several people made the statement that there had been quite a lot in the trade journals about the activities of this Committee since the time of its appointment, called attention to the fact that there had always been considerable publicity about previous buying programs, and they thought it would be a good idea to give the trade papers any information they sought on it. I afterwards saw a good many articles in the trade papers about this buying plan.

I remember no discussion at this meeting of curtailment of their refinery runs by the buying companies if the distress gasoline were purchased from the independent refiners. I remember no discussion of curtailment from that standpoint. We did discuss quite at length that we had all been drastically curtailed by the Federal allocating agencies, and that was one of the reasons why our purchasing was going to be on the increase.

2253 The list that Mr. Ashton read covered between 600 and 700 cars of distress gasoline on the market, as I remember it. I remember that Mr. Ashton, in trying to point out how small a quantity this was, made the statement that it was between 1½% and 2% of the production of the entire field.

In the February 11th telephone conversation I had with Mr. Arnott he said something to me about the East Texas Marketers Association. He simply asked me first if I had read anything about it. I told him that I had, and he said that he was in touch with that situation, that he had heard something about it, and that he felt that some constructive good might come out of it, provided the Connally Bill was passed and East Texas was really regulated. That was the only talk I had with him at that time concerning the East Texas Marketers Association. It was very brief. I think I had one other short talk later on.

At this meeting of February 11th a sub-committee was appointed. Mr. Ashton proposed it. In the discussion, pro and con, about the plan, a good many suggestions were made and angles came up that involved problems of

this sort: Who was going to keep this information of the availability of this distress gasoline before the buying companies? It was also suggested, and we had seen
2254 in the surveys or lists that Mr. Bourque had given
us, that over a month's period there were changes, a few different names and different amounts. We also realized that there would be errors in the thing, that during the month some companies who thought they were going to have gasoline to sell wouldn't have it, and others that thought they wouldn't have it, would have. So that out of all that Mr. Ashton proposed to me that a sub-committee be appointed to handle this sort of detail, and pointed out, further, that he thought that it was necessary because the Tank Car Stabilization Committee membership was pretty well scattered all over the Middle West.

Mr. Ashton made a motion that a mechanical sub-committee be appointed, and the motion was carried, and the Committee was appointed.

I think Mr. Ashton outlined what he felt were the functions of the Sub-committee. He said that it would be our duty to handle these detailed problems that arose between the monthly surveys, to pass on information on the availability of distress gasoline to buyers, and to receive any information from buyers. Some of the buyers had stated that they might like to be able to call someone and find out if they knew where they could get some gasoline in a hurry.

2255 At that meeting, I appointed the members of the Sub-committee with the help of the Committee. The Sub-committee, as appointed, was made up of Mr. Ashton and Mr. Tuttle and myself. Mr. Tuttle's office and my own were in Tulsa, and Mr. Ashton's was in St. Louis.

The offices of the other members of the Tank Car Stabilization Committee were as follows: Mr. O'Shaughnessy's offices were in Minneapolis; Mr. Karstedt's offices were in Ponca City, Oklahoma; Mr. Bullock's offices were in Chicago; Mr. van Eeghen's offices were in St. Louis; Mr. Hughes' offices were in Bartlesville, Oklahoma.

The fact of the distance between those various members and their offices had a bearing on the appointment of the Sub-committee.

I had a talk with Mr. Arnott in the latter part of February about the work of the Tank Car Stabilization Committee. It took place in Chicago on February 26, 1935. In the meantime, between February 11 and February 25 or 26, the Tank Car Stabilization Committee had not begun to function. Mr. Ashton and myself were present at that meeting with Mr. Arnott on February 25 or 26. Mr. Bourque was there for a portion of the conference.

Mr. Ashton advised me several days prior to that meeting that Mr. Arnott was going to be in Chicago on
2256 the 25th and 26th, and wanted me to be present. I
wired Mr. Ashton that I could be there. I saw Mr. Ashton and Mr. Arnott. We explained to Mr. Arnott in complete detail the plan that had been developed by the Committee in Chicago on February 5th. We told him of our meeting on February 11th and that the plan had been explained to other people that we thought would be logical buyers. In fact, we told Mr. Arnott of everything that the Committee had done up to that time, in substance, as I have told it here. That was the first time I had seen Mr. Arnott since the meeting of January 4th.

Mr. Arnott stated that he had continued to give the matter consideration, and he felt it was a very practical and workable plan, as soon as something was actually done in East Texas. By that time the Connally Bill had been passed but no action for its enforcement had been taken. So he stated that as soon as something of that sort was done, he would get in touch with us and suggest when to put the plan into operation. But he did give us at that time his definite approval of the plan.

Mr. Bourque was present during this conversation which we had with Mr. Arnott for a short while but not during
the entire conversation. Mr. Bourque had with him
2257 a current list of the distress gasoline in the Mid-Conti-
nent area, and we had a brief discussion on that. Mr. Arnott asked Mr. Bourque some questions, and Mr. Bourque's activity was along the line of furnishing information about the amount and availability of distress gasoline.

The totals of those figures were about the same as the figures that had been discussed at the February 11th meeting, as I remember it. There were a few changes in the make-up of the list, both as to the names of the companies and the amounts of distress gasoline that they had, but it was substantially the same information.

The time when the work of this Committee should commence was left just this way: That the Committee had definitely recommended to Mr. Arnott that this plan should not be put into operation until the hot gasoline was effectively stopped, and Mr. Arnott understood that and stated that we should just stand by and that he would get in touch with us later whenever he felt that the proper enforcement was going to be set up in East Texas.

2258 Our Committee wished to wait until the Connally Act became operative before putting our plan into operation because throughout all of our discussions and studies we had taken the definite position that this influx of hot gasoline into our territory at these terribly low prices was a factor that nothing else could overcome. Although our plan did contemplate trying to find buyers for distress gasoline in our own area, thus avoiding the necessity of dumping on the part of these independent refiners, we all felt, from a practical standpoint, that with hot gasoline flooding our territory as it had been since the Federal Tender Board had gone out of existence early in January, we would continue to have rotten markets.

On February 25 or 26, 1935, I learned that Mr. Arnott was holding a number of meetings in connection with stabilization work. I did not attend any of these meetings. In the morning of the 25th, I went to the hotel to locate Mr. Arnott and learned that he was in a meeting. I went in, and discovered they were discussing a local marketing situation down in Texas in which I wasn't interested. I left after having left word with Mr. Arnott that he could 2259 reach me when he wanted to see me later. I saw him later, as I have previously testified. That was the occasion of the talk which I have just described. I had other business in Chicago and I went about it.

The next meeting of the Tank Car Stabilization Committee was held in St. Louis, on March 5, 1935; in the morning in Mr. Ashton's office, and in the afternoon in the Coronado Hotel.

I know how this meeting came about. On March 1st or 2nd, Mr. Ashton telephoned me in Tulsa from Kansas City. He told me that he had been in Kansas City at Mr. Arnott's invitation and stated that the previous day, or that day, I don't remember which it was, he had attended a meeting of a large group of independent refiners that Mr. Arnott had called and had held. He said that Mr. Arnott during that meeting had asked Mr. Ashton to talk to the meeting about this plan of the Tank Car Stabilization Committee. Mr. Ashton stated that as a result of the general discussion growing out of his explanation of the plan, this group of independent refiners had appointed a committee and 2260 that they wanted to talk with our Committee to get a little better idea as to how this thing might work out. Mr. Ashton suggested that I set a date when our Tank Car

Stabilization Committee could see this committee that had been appointed by these independent refiners.

As a result of Mr. Ashton's suggestion, I called a meeting for March 5th in St. Louis. I got in touch with each member of the Tank Car Stabilization Committee to find out if he could be there.

At the meeting on March 5th, in Mr. Ashton's office, there were the following members of the Tank Car Stabilization Committee: Mr. O'Shaughnessy, Mr. Karstedt, Mr. Ashton, Mr. Tuttle, serving on the Committee at the request of Mr. Miskell, Mr. Lakin, serving on the Committee in place of his superior, Mr. van Eeghen, at his request, and myself. Mr. Hughes and Mr. Bullock were not there. There was also this committee from the independent refiners, which was made up of Messrs. Cocanower, Simmons and Boggs.

I understood the committee was made up of the
2261 three, but Mr. Winget was there as an observer,
I guess. In addition to that, late in the morning, about 11:00 or 11:30, Mr. Jacobi came into the meeting. Mr. Jacobi had not been present at any of the prior meetings of our Tank Car Stabilization Committee, nor at our talk with Mr. Arnott. He came there at Mr. Ashton's invitation.

Inasmuch as Mr. Ashton had suggested the meeting, I asked him to more or less take charge. He made some opening remarks and briefly told the other members of the Tank Car Stabilization Committee that, as a result of his brief discussion of this proposed plan at the Kansas City meeting at Mr. Arnott's request, the general group of independent refiners had appointed this committee to meet with us and to ask some questions that were on their minds as to the operation of the plan in the event it was put in operation.

Right after Mr. Ashton spoke, I think all of the independent refiners spoke. They seemed to be trying to impress our Committee with the seriousness of their situ-
ation. They told us their troubles over again, and
2262 impressed us with the fact that they were going
broke if something wasn't done. Mr. Ashton replied to them that we understood and realized all that, and that was the reason our Committee had been appointed, and that we felt that the suggestions that we had made might eventually be of some benefit to them.

There were a lot of questions asked of members of our Committee by those independent refiners. I remember specifically that Mr. Winget asked whether, if this plan went into operation, it would mean that the independent refiner could not sell brokers any more. I answered that I did not know where he got that idea, but certainly the plan did not have any such idea, that the plan simply involved an effort to put buying companies in contact with these independent refiners in the event they had distress gasoline to sell, and that if they could sell their output through brokers that it was just fine.

Some questions were asked by the independent refiners in respect to price. Mr. Simmons of Rock Island
2263 Refining Company asked a question about what price was going to be paid, and Mr. Ashton answered that this plan did not involve any price-fixing scheme at all, that there was no authority on the part of the Committee to set any price, but that we were earnestly suggesting that the buying companies consider paying the fair going market price in the event they did make purchases from the independent refiners.

Mr. Simmons said that he did not think that was much of an answer, that the price of gasoline was so low that he could not continue to operate very much longer unless something was done about it, and I think he spoke quite at length on the subject. Mr. Ashton simply told him that the plan did not involve anything of that sort, that the companies were going to make their own deals, and that it would be up to the selling companies to get the best price they could from the companies that approached them for the purchase of the gasoline.

As I remember, the figures that had been prepared by Mr. Bourque relative to the independent refiners and the amount of distress gasoline were referred to only generally by Mr. Ashton, sometime or other during the conversation, in dealing with the total amount of distress gasoline. I do not recall that the list was read off in detail, or that there was any discussion about the individual location of this gasoline.

2264 We told this committee of three independent refiners that if this plan was put into operation, the Tank Car Stabilization Committee suggested that we get the information as to the availability and location of this distress gasoline from Mr. Bourque once each month, and we asked this committee of independent refiners to explain that to their entire group and urge them to give Mr. Bourque accurate and honest figures.

We explained also to this committee of small refiners the development that would be made of that so-called Sub-committee and its functions. Mr. Ashton told them who made up the Sub-committee, and explained that this Sub-committee would be around in the field and in a position to receive information as to the availability of distress gasoline that was not on the monthly survey; that the Sub-committee would then attempt to find buyers for this gasoline; and that the Sub-committee would also at times have information as to the concerns who were buying. In other words, the Sub-committee was to act as sort of a clearing house or a medium through which information would be passed between the buying companies and the selling companies with reference to the quantities of this distress gasoline.

Mr. Ashton also pointed out that the Tank Car Stabi-
lization Committee suggested to the Sub-committee
2265 that in their contacts with the field buyers—not all
of the major companies had field buyers—but in
their contacts with those that have field buyers, they should urge those field buyers to pay a fair going market price.

We told the committee of independent refiners very definitely that the sales would all be negotiated directly between the buying companies and the selling companies, and that this Sub-committee would make no purchases or make no sales, would have no buying power, and would not be a sales agency at all; that it would simply serve to pass on information between buyers and sellers.

Several of the independent refiners stated that they felt that this plan was encouraging. But, frankly, they seemed to be very impatient for action, and they seemed rather disappointed, I think, in the extent to which the plan expected to go. Furthermore, we could not tell them at that time whether the plan was going into operation or not, because we were still awaiting word from Mr. Arnott. But I think, in general, they felt somewhat encouraged, and so expressed themselves.

After that discussion, we adjourned along about 12 o'clock, and I did not see any of the members of this independent refiners committee again. Our Tank Car
Stabilization Committee went to the Coronado Hotel
2266 for lunch. We continued the meeting after lunch.
None of the independent refiners were present either
at lunch or at the meeting that followed. All of the members of the Tank Car Stabilization Committee who were present at the morning session were present at the afternoon session.

At the afternoon session I asked Mr. Ashton to explain, for the benefit of those members of the Committee who had not been at the Chicago meeting on February 11th, what had taken place at that time. Neither Mr. Jacobi nor Mr. Tuttle had been there. Mr. Ashton briefly told of the general reaction of that part of the industry that we had talked to at the Chicago meeting to this proposed plan. He stated in substance what I have already related here, as to what he stated on February 5th and February 11th.

Mr. Ashton then took a more recent survey, one that had been sent to him, I learned later, by Mr. Bourque, and asked the members of the Tank Car Stabilization Committee who were present if they had developed any new or different ideas about their purchasing desires or contacts since the Chicago meeting.

Mr. Ashton had a list of independent refiners, showing the quantity of distress gasoline that they would have available for the month of March. Several of the
2267 members of the Committee said something about
the independent refiners from which they would like to purchase.

I stated that we were going to have to do some buying, and that I was interested in contacting Johnson Oil Refining Company and Cushing Oil Refining Company. Other members of the Committee mentioned companies from whom they would like to buy. Mr. Jacobi mentioned Champlain Refining Company. I remember that particularly. Other members of the Committee were asked for their preferences. Mr. Karstedt of Continental stated that his company was interested in buying from Shamrock Refining Company out in the Panhandle of Texas. He stated that that gasoline at that particular location fitted into their marketing picture quite well, because of freight saving possibilities. He said that he was quite sure they would be interested in buying gasoline from Shamrock.

When these men spoke there they were speaking for their individual companies, what their companies would need, what their companies would want, and what their companies would do.

Mr. Tuttle told us that due to the fact that Empire Oil & Refining Company had recently closed down its Gainesville, Texas, refinery, he had already been in negotiation with Olney Oil & Refining Company at Olney,
2268 Texas, and that his company very definitely was going
to be interested in buying gasoline from that source. He said the reason it wanted to do that was because it had closed down the Gainesville refinery and the location

of the Olney plant fitted into its picture there from a freight standpoint.

I stated why our company wished to purchase from Johnson and from Cushing. With respect to Johnson Oil & Refining Company I stated that we were selling them some crude oil and also we had sold them considerable quantities of burning oils each winter for several years; and there were several men in its sales department who were old personal friends of mine. The reason I mentioned Cushing Oil Refining Company was my personal friendship with Mr. Winget, and the fact that we had bought gasoline from it previously and its plant was located reasonably close to Tulsa.

Mr. Lakin stated that they were interested in buying from the Cushing Oil Refining Company at Cushing, Oklahoma. He said that they had had pleasant relationships with it in the past, and there were certain reasons why they wished to continue that.

It is my recollection that Mr. O'Shaughnessy stated that he would be desirous of buying from Omar Refining
Company at Garber, Oklahoma, and Cushing Refin-
2269 ing Company at Cushing, due to the fact that both of
these refineries were located reasonably close to Blackwell, where Mr. O'Shaughnessy's company, the Globe, has a refinery which, I think, was closed down at that time. Mr. O'Shaughnessy said that it would be convenient for them to get their tank cars into these other refineries to take care of the purchases that they would need to make.

After these various members of the Tank Car Stabilization Committee had suggested those refiners from whom they would like to buy, all the independent refiners on the list were not taken care of.

I don't recall that there was anything said there definitely about the amount of gasoline that any company could or would purchase. They were stating at that time more particularly the places where they wanted to make contacts, what could be worked out from the standpoint of the quality of the gasoline and the quantity, and many other things. I think Mr. Jacobi, at that meeting, did indicate that he could buy a certain number of cars from Champlain. I don't remember the number of cars, but I do believe that Mr. Jacobi said that he knew what Champlain's material was, and that he had orders on hand and that he could buy a certain quantity of gasoline. He is the only one that I remember who said he would take a definite quantity.

2270 After we had gone over the list in the way I have described, there remained a good many independent refiners whose names had not been mentioned by the members of our Committee. Mr. Ashton asked the members of the Committee, who were there, to consider some of those other refiners and see if they could not fit them into their picture in some way. I think a few of them indicated that they would think the matter over further or discuss it with whoever in their organization did the actual buying; but there was nothing definitely concluded on that.

Mr. Ashton said that he would get in touch with the buying companies that were not present at the meeting. It is pretty hard to say how much of the gasoline, as shown on the list, was spoken for by one or another of the various companies, either directly or indirectly, because, as I recall it, although several companies indicated that they were interested in, and would contact certain companies, they did not say that they would need to buy the amount of gasoline that that company had down on the list. So, due to that fact and the fact that not all of the companies were even mentioned, I should say that probably not over 60% or 70% of the number of cars of gasoline on that list was spoken for.

2271 Distress material in the hands of independent refiners which did not appear on the list was mentioned as one of the very definite possibilities that we would be confronted with from time to time. There was a suggestion as to the possibility of interesting other buying companies who might want to purchase gasoline. Some were mentioned as possibilities, but there was no action taken with respect to them at this meeting.

At this afternoon meeting on March 5th, there was a change made in the personnel of the Sub-committee. Mr. Ashton requested that Mr. Jacobi serve on the Sub-committee in his place, due principally to the fact that Mr. Jacobi lived in Tulsa, where the other two members lived and had their offices. Mr. Ashton stated that he felt that that would facilitate the work of the Sub-committee. The Committee discussed that request of Mr. Ashton very briefly and decided that it was a constructive suggestion. That Sub-committee, then, consisted of Mr. Jacobi, Mr. Tuttle and myself.

At this meeting at the Coronado Hotel we had the duties of the Sub-committee explained, and how it would

operate. Mr. Ashton covered the duties, as he saw them, again stating that the Sub-committee would be down there in the field close to the information that would
2272 arise from time to time; that it would be its duty to pass on information as to the availability of this distress gasoline to the buying companies; that when additional distress gasoline showed up, which had not been on the survey, the Sub-committee would try to find somebody who was interested in buying it; and that the Sub-committee in its contacts with the buying representatives in the field would urge that they pay a fair, going market price in these transactions.

There was talk about future meetings of the Tank Car Stabilization Committee, and it was decided that we should attempt to have a meeting once a month, if possible, around the latter part of the month or the early part of the next month, so that the information on these surveys would be reasonably current and accurate. At that time we did not set a date for the next meeting, because it was too far ahead. These men were all busy men, and it wasn't possible. Also, we didn't at that time know whether the plan was ever going into operation, because we hadn't had the final approval of Mr. Arnott.

After the meeting at the Coronado Hotel on March 5th, I went back home. Sometime during the afternoon of the 6th I received a wire from Mr. Ashton which stated very briefly that he had received word from Mr.
2273 Arnott to go ahead and put the plan in operation.

The first thing the next morning I called Mr. Ashton on long-distance telephone to find out more about what Mr. Arnott had said to him. I asked him if Mr. Arnott had said anything about the East Texas situation, about the Tender Board, and things of that sort. Mr. Ashton told me that Mr. Arnott hadn't gone into any great detail with him, and that Mr. Arnott simply told him that he was convinced that it was time to put the plan in operation, that the Code authorities that he was talking to in Washington felt that we should go ahead, and therefore he had given us those instructions.

I presume the Tender Board under the Connally Act was in active operation by that time. I think it was set up on March 1st.

As a result of my talk with Mr. Ashton, I telephoned Mr. Jacobi and Mr. Tuttle and told them of this word that I had received from Mr. Arnott, and I asked them to meet at lunch that day so that we could discuss how we would proceed.

At lunch we had just a brief discussion. I told them what information I had received from Mr. Arnott through Mr. Ashton, and that I felt that the first thing we should do was to phone this information to all of the com-
2274 panies who had indicated a desire to buy gasoline.

In order to divide up this work of phoning, we at that time made a division of the twelve companies that we considered to be logical buyers of gasoline.

I think there were articles in the Chicago Journal of Commerce and other trade papers about the meeting of March 5th at St. Louis. I know there were about all our meetings.

In the discussion at lunch with the other members of the Sub-committee I said that I would contact Phillips Petroleum Company, Barnsdall Refining Company, and Standard of Indiana. Mr. Jacobi said that he would contact Shell, Globe, Sinclair, and Pure. That left Skelly and Continental for Mr. Tuttle.

I don't think I went into what information should be given to the various companies in any great detail with the other members of the Sub-committee. I simply suggested that they phone these companies as quickly as possible and tell them that we had received word from Mr. Arnott to put the plan into operation, and to suggest to them that if they needed to buy they have their field men start making contacts with the independent refiners from whom they desired to purchase. Of course, some of these companies had already been buying.

2275 I remember no discussion at all at our lunch meeting about the price at which the purchasing companies could buy gasoline from the independent refiners. We had some discussion about price. We had a general discussion about the market situation, I am quite sure, because I don't believe any two oil men can ever get together any place that they don't talk shop, and part of our shop talk is, "What is the market?" And, "What are prices?"

What the market is, is quite a complex thing, in my opinion. There are several important factors, however. One would be the price at which you either knew that you could buy, or the price at which you had bought. Another would be the price that you might have learned on good authority that other people had sold gasoline for, or that other people had bought gasoline for. I always go to the brokers to get market information, because they often times have slants on the market that we, as refiners, don't have.

Then, there are the trade papers. You see what their ideas of the market are. You put all those four or five factors together and you arrive at an idea of what is the market. Even then it is not a definite, fixed figure, because you have a range in your ideas, like 4½¢ to 4¾¢, or 4½¢ to 5¢.

I think my explanation of how I would arrive at
2276 what the market is indicates that the market price as
reflected in the trade journals is only one of the elements I take into account. That is just one of the factors, because the trade papers only purport to publish their ideas about a certain section of the market. They purport to publish their ideas of the prices upon transactions between refiners and jobbers and consumers in spot transactions.

I think I have with me the published prices for third-grade material in the Chicago Journal of Commerce and Platt's Oilgram for the Oklahoma refinery market between March 1 and March 7, 1935. The Chicago Journal of Commerce for third-grade material on March 1 showed a price range of 3¼¢ to 3½¢. On March 2, it showed the same prices. March 3 apparently was a Sunday; no prices. March 4, the low had increased ⅛¢ to 3⅜¢, and the high was still 3½¢. On the 5th, the quotations were still the same as on the 4th, 3⅜¢ to 3½¢. On the 6th, the low increased another ⅛¢ to 3½¢, and the high increased ⅛¢ to 3⅝¢. On the 7th, the low remained at 3½¢, but the high was increased ⅛¢ to 3¾¢.

The first meeting of our Sub-committee was on March 7th.

Platt's Oilgram, Oklahoma market, third-grade gasoline,
on March 1 was a low of 3¼¢ to a high of 3½¢. On
2277 the 2nd, the low increased ⅛¢ to 3⅜¢, and the high
remained at 3½¢. There was no market on the 3rd. On the 4th, the low remained at 3⅜¢, but the high was increased to 3⅝¢. On the 5th, the low was increased to 3½¢, and the high was increased to 3¾¢. On the 6th, the prices were the same as on the 5th. But the 7th, the low increased another ⅛¢, to 3⅝¢, and the high to 3¾¢.

That advance had taken place before the date of our first meeting of the Sub-committee. The total net advance of third-grade gasoline, as reflected in the trade journals, between March 1 and March 7, 1935, was: in the Oilgram, the low quotation had gone ⅜¢ per gallon, and the high had gone up ¼¢ per gallon; and in the Chicago Journal of Commerce both the high and the low had gone up ¼¢ per gallon.

After this luncheon meeting on March 7, I phoned each of the companies that I said I would advise of the operation of the plan—Phillips, Barnsdall and Standard of Indiana.

In Standard of Indiana, I talked very briefly to Mr. Bullock, who was a member of the Committee. I simply told him that I had received word from Mr. Arnott to put the plan into operation, and that the Sub-committee was phoning that information to all of the known buying companies, and I hoped if he had gasoline to buy that they would put their field representatives in contact with whoever 2278 they wanted to buy from. Mr. Bullock thanked me for the information, and he didn't tell me anything definitely as to what they would do. That is the only conversation I had with Mr. Bullock at that time.

I talked with Mr. Hughes in Phillips Petroleum Company. I told him of the word that we had received from Mr. Arnott, and that we were phoning various companies to give them this information and suggested to him that they contact the companies that they had previously indicated their desire to contact.

I talked with Mr. Evans in Barnsdall. I talked with him a little more at length and on a little different basis because he wasn't a member of the Tank Car Stabilization Committee and these other two gentlemen were and knew as much about the matter as I did. I told Mr. Evans that I understood that they were buying gasoline and that I didn't remember any indication as to just who it was they desired to buy from. I told him briefly of this Committee's plan, and that Mr. Arnott had that day given us word to put it into operation. I told him of the Sub-committee and who it was made up of, and that I would be telephoning him from time to time to call his attention to the availability of distress gasoline. He told me that Barnsdall was going to have to buy gasoline and that he would appreciate receiving this information. I am quite sure I mentioned to him the 2279 name of a prospective seller, but I can't remember who it was.

I know definitely that I didn't discuss price with either Mr. Bullock or Mr. Evans. I do seem to recall that in my discussion with Mr. Hughes he referred to the fact that they had been doing considerable buying, and to the fact that the market had strengthened considerably in the past week or ten days. I think we had a little discussion about the market, but it had nothing to do with the thing that I particularly called him about.

The Sub-committee had its next meeting on March 14th. I called this meeting. I had been out of town for several days, and I think upon my return I had a phone call from Mr. Jacobi. He stated that he had some information with reference to additional distress gasoline, and that he would like to talk to me about it. In view of the fact that I had been away, I suggested that we have a meeting. I called Mr. Tuttle. We met at lunch.

At the luncheon with Mr. Tuttle and Mr. Jacobi, we first discussed the information that Mr. Jacobi had with reference to some additional distress gasoline that had come to his attention. We had quite a discussion about who would be logical people to approach in an attempt to interest them in buying this gasoline. In doing that, we considered the quality of the gasoline, its location, and other matters
2280 of that sort which we felt were pertinent to the subject.

We had quite a discussion about markets from at least two different angles. In the first place Mr. Jacobi, after we had discussed this additional gasoline that he had memoranda on, mentioned to us that some independent refiner during that week had complained to him that some major company in attempting to buy from them had tried to chisel, as he expressed it, on the price. That provoked quite a discussion among us. I took the position that I thought that that was the wrong thing to do; that I didn't think that any one should try to chisel on these independent refiners. I said, however, that, after all, this plan didn't give the Sub-committee any authority to make prices, and that these deals had to be worked out between the buyers and the sellers. My position was that although I thought we should use such influence as we could, if we knew of any specific instance, to urge people to pay a fair going market price, after all we couldn't enter with any authority into price quarrels between buyers and sellers; and that the independent refiner would simply have to take care of himself.

We also had a general discussion as to our ideas about the market at that time. Before going over to this meeting, due to the fact that I had been out of town for several days, I had had a brief discussion with the men in my
2281 office who actually handled the bulk of the buying, and had attempted to get from them their impression of what the market was. They had told me that the market was much stronger, and that several refiners with whom they had been dickering had withdrawn offerings from the market; and that some of them were asking prices in excess of what we figured the market was, with the general

result that we hadn't been able to buy any gasoline. I remember that they stated that they had been offering to pay 3⅝¢ and that it looked to them as though we would have to pay at least 3¾¢ if we wanted to buy. That is on third grade gasoline, and I am referring to discussions I had in my own office before going to the meeting.

Then, in our meeting, when we discussed the market situation, I expressed the opinion that I had gained from these other fellows. It was my impression that both Mr. Jacobi and Mr. Tuttle had actually done some buying at that time. At least Mr. Jacobi stated that he had paid 3¾¢ for gasoline previously that week. Our conversation was built around the impressions that we all had of the market, from our own individual buying or attempts to buy at that time. We certainly discussed the fact that the market had been strengthening, and had strengthened considerably over the past two weeks; and I imagine we discussed the fact that the market, because it was strong and moving up, would probably be higher later on.

2282 In my discussions on that day, I was discussing my impressions of the market at that time, because they were based on information I had received that morning in my own office as to what they thought the market was.

There was no discussion at this Sub-committee meeting on March 14 as to what prices our company or Mr. Tuttle's company or Mr. Jacobi's company should pay for gasoline.

After the meeting of our Sub-committee on March 14th, I did not order nor urge nor recommend nor suggest to any purchasing company that it pay 3¾¢ as a minimum for gasoline.

In my discussions with anyone in the industry, if he would ask me the question, I would tell him the price I was paying for gasoline.

After that meeting I have a recollection of just one discussion, and that was with Mr. Hughes. I was back in my office, and I had some memoranda on some additional distress gasoline and I was trying to find somebody who could buy it. One of the people to whom I telephoned was Mr. Hughes. I remember I told him about some of this additional distress gasoline. He didn't tell me anything definitely at that time, whether he could buy it or not. But I do remember very distinctly that he said they had 2283 been having to buy quite a lot of gasoline, and the market looked very strong to him, and he was quite optimistic. As a feeler, I asked him what he had been paying, and if I remember correctly, he had been paying either 3⅞¢ or 4¢. He then asked me if we had been doing any buying, and I told him that we hadn't during March up until that afternoon when we had made a purchase at 3¾¢. I think he made some remark about our being better buyers than he was. That is the reason I remember the incident. The afternoon of March 14th was the first time that we had bought during that month.

Without knowing what was in another man's mind, it is a little difficult to account for the statement "Our committee decided on a price of 3¾¢ for third grade, and 4¾¢ for 'Q' for next week," contained in Exhibit 682, which is Mr. Jacobi's letter of March 15, 1935 to Mr. A. G. Maguire of Wadhams Oil Company. I think I could reconcile that statement reasonably well with the facts that I have just testified to. In our discussions of the market in that meeting of the 14th, the day prior to this letter, Mr. Jacobi, I know, had stated that he had been buying at 3¾¢. I stated that we had been unable to buy at 3⅝¢ and were going to have to pay 3¾¢. Obviously 3¾¢ was the bottom of the market, and I think he just used words there a little carelessly, and really meant that the three of us in
2284 discussing our individual ideas about the market all
felt that the market was 3¾¢ on third grade gasoline. As to the "Q" gasoline, I don't remember any discussions about it at all at that time. However, it usually sells for a differential of ⅞¢ to 1¢ a gallon above the third grade gasoline; so that the 4¾¢ price on "Q" would be in line with the 3¾¢ market on third grade gasoline.

"Q" gasoline is a term that is used to describe a house-brand gasoline of 68-70 octane. The word "Q" came into being due to the fact that when the Ethyl Gasoline Corporation licensed refiners to blend lead into non-premium gasoline, they did it on a contract that they called "Contract Q," and the industry simply picked that up and referred to that grade of gasoline as "Q" gasoline. "Q" gasoline usually would be ethyl gasoline, but in market parlance it refers to any gasoline of 68-70 octane regardless of whether it was arrived at by cracking or by the use of lead. There are refiners who can make 68-70 octane without the use of lead, and do it.

Our Sub-committee continued to meet after March 14th. Our meetings were quite irregular, due to the fact that both Mr. Tuttle and myself were out of town quite a lot. Sometimes we had two, maybe three, meetings a

week; other times the meetings would be a week or
2285 ten days apart. There must have been times when
they were two weeks apart, so far as I am concerned, because of my absences from the office. But we met whenever we could get together, and whenever there was distress gasoline to consider, except for this: that we did handle quite a little of that over the telephone. We didn't always have to have a meeting. Mr. Jacobi might call me, or I could call him, or he could call Mr. Tuttle, and maybe we could work whatever the problem was out over the phone. I don't recall any meetings of the Sub-committee after December, 1935.

I should imagine that we discussed the market at every meeting we had. I don't remember the specific discussions as I did on this first one because of the many circumstances that surrounded it. As I said before, any time any two or three oil men get together, they usually talk prices; so I am sure we talked about the market most of the time.

I made telephone calls to representatives of various purchasing companies from time to time. Here is a typical conversation: After arriving in my own mind as to who would be a most logical purchaser—and many times I was mistaken—I would call this company and say, "Well, are you buying any gasoline? Do you need any more gasoline this week?"

2286 Maybe they would say yes, or maybe they would
say no, or maybe they would say they didn't know. But, regardless of their answer, I would say, "Well, so-and-so"—being an independent refiner—"has 10 or 15 or 20 cars of gasoline he would like to sell the balance of this month," or whenever he needed to sell it, if I knew. And I would say, "If you can fit this in with your needs, why, I know this fellow will appreciate it if you will get in contact with him."

Sometimes the party to whom I was talking would say, "Well, we do need some additional gasoline, and we will get in touch with this concern." Other times, they would say, "Well, I don't know; I will have to check it up with the fellows that are doing the buying." I usually talked to men who weren't doing the actual, routine buying. On many occasions they would say, "Well, I happen to know that we are not in the market at the present time for any more gasoline." Then I would have to put in some more phone calls.

That represents typically what I would do in talking to these prospective purchasers, in an effort to find out whether they were in the market for gasoline. I think that sometimes some of these people to whom I would talk would say, "Well, what kind of gasoline is it, or how much do they want for it?" And I never knew how much this independent refiner wanted for the gasoline. I didn't seek 2287 that information, and it wasn't given to me. I usually tried to know what grade of gasoline it was, so that I could answer that question intelligently.

The next meeting of the Tank Car Stabilization Committee after the meeting at St. Louis on March 5th, was in Excelsior Springs, Missouri, during the first week of April, between April 4 and 6, 1935, at which time the Western Petroleum Refiners' Association was holding its annual meeting. There were between 300 and 400 oil men at Excelsior Springs during those few days.

With one or possibly two exceptions, all of the members of the Tank Car Stabilization Committee were members of the Western Petroleum Refiners' Association. I had reason to believe that they would be at this annual meeting and convention of the Western Petroleum Refiners' Association, so I simply tried to work in a meeting that would eliminate the necessity of the Committee going some place else away from their homes at another date.

I called the meeting of the Committee. As I recall, the following members of the Committee attended: Mr. O'Shaughnessy, Mr. Ashton, Mr. Karstedt, Mr. Tuttle, Mr. Miskell, one of the last times that I remember his 2288 showing up, and myself. Mr. Jacobi was there, but he was not a member; he was a member of the Subcommittee, but he was not a member of the Tank Car Stabilization Committee. It runs through my mind that we invited into the meeting of the Committee a few representatives of major buying companies who were there, but I can't tell you who they were; I don't remember.

I should say that the procedure at the meeting on April 4 and 5 of the Tank Car Stabilization Committee at Excelsior Springs was substantially the same as that followed at the St. Louis meeting.

I believe the Tank Car Stabilization Committee held meetings each month during the remainder of 1935. I did not attend all the meetings. I think I can tell which meetings I did attend if I may refer to a memorandum here. I attended a meeting in Chicago on June 6 or 7, 1935. I attended one meeting in September in Tulsa, and another one in December in Tulsa. The last meeting of the Tank Car Stabilization Committee that I attended was in January, 1936. I did not attend a meeting in February, 1936, in Chicago.

The procedure at the meetings that I attended of the Tank Car Stabilization Committee in 1935 and 1936 was substantially the same as that which was followed at the Excelsior Springs meeting and in St. Louis.

2289 I did not call any meetings after the January, 1936 meeting. The Tank Car Stabilization Committee did not, to my knowledge, have any meetings after February, 1936. There were several reasons for that. The principal reason was because rather substantial and well worked out contacts had been established between buyers and sellers. The sellers were getting directly in touch with the buyers, and it was just one of those constructive things that comes to a point where it carries on. Furthermore, it had been quite difficult the last two or three meetings to get the members of the Committee to attend, so it was just dropped.

I attended at Mr. Arnott's invitation a meeting in the Blackstone Hotel in Chicago about June 6 or 7, 1935. The group present at this meeting was substantially the same group that he invited to all of his general stabilization meetings.

Mr. Arnott said a good many things at that meeting. He spoke primarily of the effect of the Schechter decision upon the petroleum industry and Code activities. The Schechter decision was the decision of the Supreme Court that knocked out the N. I. R. A., and that knocked out our Petroleum Code.

Mr. Arnott stated that he had come from Washington particularly to discuss this subject with the industry 2290 of the Middle West. He said that he had talked to a number of rather important people in the petroleum industry; that he had talked to various code authorities in Washington and to the P. and C. Committee; and that all concerned were of the opinion that our industry should attempt to carry on; that even though the Code had been knocked out, we should attempt to hold the advantages that had been gained through codes and fair trade practices, and to carry on in a voluntary manner all those constructive things that we had learned to do under the Code.

Mr. Arnott made definite reference, as did other people in the discussions that arose, to various press releases that had appeared in the papers, quoting gentlemen like Mr. Richberg, Mr. Fahy, and the President himself in his famous "horse and buggy" statement.

Mr. Arnott used those releases and statements to indicate further that the whole attitude of official Washington, although one of some confusion, was one in which they were asking all industry, including our industry, to carry on with the constructive objectives that had been a part of our Code itself, so that industry could operate along 2291 on a profit and continue to pay code wages and code hours.

Prior to this meeting in Chicago, press releases of the nature which Arnott mentioned had come to our attention. I had read several in our local papers.

I was at home in Tulsa, Oklahoma, between May 27th and June 5th. I read the Tulsa World in the morning and the Tulsa Tribune in the evening.

Q. I show you a photostatic copy of the Tulsa World dated Tuesday, May 28, 1935, and direct your attention to that article under the heading that you see there, and ask if that is the article you refer to (showing photostat to witness)?

A. That is the Richberg article that I referred to, that particular reference to the oil industry.

(Document referred to marked Exhibit 899 for identification.)

The article in the Tulsa Daily World dated Wednesday, May 29th, which you show me, is an article containing a press release referred to by Mr. Arnott in regard to Mr. Fahy's statement.

(Document referred to marked Exhibit 900 for identification.)

The photostatic copy of the Tulsa Tribune dated 2292 May 31, 1935, which you show me, is the press release referred to by Mr. Arnott in the meeting at Chicago that I have described in reference to the "horse and buggy" speech.

(Document referred to marked Exhibit 901 for identification.)

I should say that the subject matter of these releases certainly did become a matter of general information throughout the oil industry, because we were all interested in knowing what the future of our industry was going to be, and we had been operating under a code for practically two years. I know my own reaction was that I searched every paper every day for anything out of official Washington as to what we might expect, and it was the general discussion every place you ran into anybody, as to what we were going to do and what anyone else was going to do.

Mr. Donovan: Your Honor, that argument seems to be directed to the point that our position here is that we are claiming exemption of the Sherman law. I have said repeatedly in answer to the contention of the Government, that we make no such claim. We claim that what we did was justified under the Sherman law.

2293 (Copies of newspaper articles, previously so marked for identification, are received in evidence, respectively, as EXHIBITS 899, 900 and 901.)

(Exhibit 900 read to jury.)

The Court: I don't think what Mr. Richberg said at that time amounts to that (snapping fingers). But it went to the jury and they heard it and they know themselves about as much what happened at the time of the N. I. R. A. decision and the effect that that decision had, that the Code collapsed and went out. That is all. And I think that is as far as we ought to go with these articles.

Mr. Donovan: Your Honor, may I respectfully take exception to your Honor's remark, that what Mr. Richberg said—

The Court: I had the impression that Mr. Richberg was spokesman for Mr. Ickes and the White House, but after looking over this chart I find that he was just a member of the Planning and Coordination Committee.

And he had no authority to speak for anybody but himself.

Mr. Donovan: May I say this, that I respectfully take exception to your Honor's statement that what Mr. Richberg said did not amount to the snap of the fingers, because I think your Honor must take judi- 2294 cial notice of the fact that whatever position Mr. Richberg held at that time, it was generally recognized throughout the industry that he was in a position in Washington relative to the National Recovery Act which meant something to these men in the industry, so what he did say must have come as a word of authority to these men. Otherwise, there would not have been any publication of his statement; and I think that in view of that fact—

The Court: Well, I presume there were a lot of men in Washington would like to speak at times to hear themselves.

Mr. Donovan: They might have liked to have spoken but it would not have been received with any degree of authority.

The Court: What he said was well said, and it was very timely, and I approve of what he said, but as far as having any effect upon this lawsuit is concerned—

Mr. Donovan: The only purpose of this offer was in relation to the effect that what he said had upon this defendant and upon other members of the industry, as to the continuance of their work. That is the purpose of it. And so far as they were concerned, it would mean infinitely more than the snap of the fingers.

2295 The Court: These defendants knew just about as much about the whole situation as Mr. Richberg; and I suppose they were inspired by the same patriotic motives that he was inspired with at the time.

Mr. Chaffetz: If these people—Mr. McDowell—went to Mr. Richberg and asked him specifically, shall I carry on these buying programs, Mr. Richberg did not have any authority to tell him to go on, and Mr. Richberg didn't purport to talk about buying programs; so, what effect would a general statement have?

If this is in the record we have got something that we would like to add—we would just as soon keep the whole thing out, but the jury has heard what was said—we can't withdraw that; but I would like for the record, your Honor, to have your Honor grant our motion to strike all of the newspaper articles, which would also bar the Government from bringing in similar articles.

The Court: No, I will let that stand.

Mr. Donovan: May I read the statement of Mr. Richberg?

The Court: You may read that statement of Mr. Richberg. You have talked so much about it now that I think the jury ought to know what it is.

2296 (The sixth, beginning, "It would be most harmful * * *," and the seventh paragraphs of Exhibit 899 read to the jury by Mr. Donovan.)

We held a meeting of the Tank Car Stabilization Committee in Chicago on June 6 or 7, 1935. We held it shortly following the adjournment of the general meeting called by Mr. Arnott. I believe all the members of the Committee were there with the exception of Mr. Bullock. They had all attended the general meeting just preceding, and were there at the time that Mr. Arnott made his speech.

At this meeting of the Tank Car Stabilization Committee, we discussed briefly amongst ourselves the general attitude of the industry that we had heard expressed in the other meeting, and we asked ourselves the question about the future of this Committee. After considerable discussion pro and con, we concluded that this activity that we had been engaged in was a proper and constructive one in that it had been aimed at aiding in the elimination of the destructive and unfair practice of dumping distress gasoline on the market. We even stated that our own companies, individually, were going to have to continue to buy gasoline, regardless of the Schechter decision, because our business was increasing in splendid shape that summer, and we said we would like to continue to get that in-
2297 formation of these monthly surveys. So it was decided to continue to request this information from Mr. Bourque and to hold meetings whenever convenient.

The objectives of the Tank Car Stabilization Committee that we talked of and had were three or four in number. The first objective was to aid in the general stabilization activities of Mr. Arnott under his letter from Secretary Ickes. Second, we hoped that this activity would aid in the elimination of the dumping of distress gasoline, which we considered to be an unfair and uneconomic practice in the industry. And third, we felt that this activity of ours was directed to and would aid in accomplishing two of the objectives of the Petroleum Code itself; one being the parity between gasoline and crude, and the second being the provision in Article 4, Section 5, I believe it was, which provided against selling any product at less than cost.

After the meeting of the Tank Car Committee on June 6th or 7th, I reported to Mr. Arnott, very briefly. I told him of our discussion and the conclusion that the Committee had reached. I told him that in view of the expressions to the General Committee and in view of these trade releases that we had all discussed, and an apparent attitude not only of officials but of the individuals of our own industry, that the industry should attempt to hold onto the advantages that it had gained, and in so doing,
2298 that we were going to continue to gather this information and hold monthly meetings. He said he thought that was fine.

I was reimbursed for expenses I incurred for this work on the Tank Car Stabilization Committee. I discussed the question of reimbursement with Mr. Arnott several times, and at one time with Mr. Majewski, who was a member of the P. and C. Committee. I was requested to submit the expense to which our company had been put by my activities on this Committee to the P. and C. Committee for reimbursement.

(Documents referred to marked Exhibits 903-A, and 903-B, and 903-C, for identification.)

Exhibit 903-B for identification is a statement, dated June 11, 1935, made out under my instruction to the Planning and Coordination Committee, Washington, D. C., to cover telephone expenses in connection with Code work for the period ending June 5, 1935. That was the first and only bill I submitted and it covered the entire period.

Exhibit 903-A for identification is a check in the amount of $322.10 made payable to me, a check of the Planning and Coordination Committee.

Exhibit 903-C for identification apparently is an inter-office check voucher of the P. and C. Committee covering this transaction.

2299 Mr. Erance, the president, was my immediate superior in my own company. The telephoning included in that voucher I submitted included only the telephoning I did in my work as chairman of the Tank Car Stabilization Committee.

(Documents referred to are received in evidence, respectively, as EXHIBITS 903-A, 903-B and 903-C.)

I endorsed the check which was made payable to me, R. W. McDowell, by the Planning and Coordination Committee under the Code for the Petroleum Industry, check number 1550, dated June 18, 1935, and deposited it to my own personal account. I then wrote my own personal check to the company for the same amount. None of the proceeds of that check went into my pockets. It all went to the company. That is on the theory that my company had paid my expenses all the way along. When I said "my company" I meant Mid-Continent Petroleum Corporation. I cannot say whether it was Mid-Continent Corporation of Delaware or of Kentucky.

At the present time I work for Mid-Continent Petroleum Corporation of Delaware. There is no Kentucky Company. I was an officer of both companies in 1935 and

1936. I cannot tell you who signed my pay check. I believe it was the Kentucky Company, but I am not sure. The Kentucky Company was the subsidiary of the Delaware Company. It owned the retail marketing 2300 outlets. The Delaware Company owned the refinery and the production and the pipe lines. In our office set-up there was no distinction between the two companies. There was a distinction between the companies officially and from a bookkeeping standpoint, but I had just one office and I worked for both companies.

Under my supervision, I had charge of buying such petroleum products as we needed to buy to augment our own production, but the principal job was to sell, because we are large manufacturers of all petroleum products. I had under me the wholesale and retail sales, that is, the tank car sales and, then, the retail station operations were under me too.

I operated those other various division offices where we had managers and things of that sort. But they all headed in under me. I was in direct and complete charge of all our sales and marketing activities of every kind whatsoever. In addition to that, I had charge of the buying of everything but crude oil. That was a separate department.

It is not true as charged in paragraph 8 of the indictment that I and other persons beginning in the month of of February, 1935 and continning down to December, 1936, combined and conspired together for the purpose of artificially raising and fixing tank car prices of gasoline in the East Texas and Mid-Continent spot markets.

2301 It is not true as charged in the indictment that, as intended by us, we artificially raised and fixed the spot market price of gasoline.

It is not true as charged in the indictment that I and other defendants maintained these prices at artificially high and non-competitive levels, and at levels agreed upon among us, to thereby intentionally increase and fix the tank car price of gasoline contracted to be sold and sold in interstate commerce in the Mid-Western area.

I did not knew of any Mid-Continent buying program for the purchase from independent refiners in spot transactions of large quantities of gasoline at uniform high, and at times progressively increased prices, as alleged in the indictment.

I knew of the plan of this Tank Car Stabilization Committee which has been referred to by many people as a buying program. It may well be called one, I presume. The plan that I have described to the jury is the only thing I know anything about.

I did not agree with any of the other defendants or defendant companies to make purchases at uniform prices. We made our purchases at competitive prices.

It is not true as charged in paragraph 23 of the indictment that each of the defendant major oil companies has taken a part of the large quantity of gasoline purchased as from time to time was allotted to such companies by Mr. Tuttle, Mr. Bourque, Mr. Jacobi and me. I never allotted any gasoline. I do not think the others did either. 2302

With reference to the charge that the purchases from these independent refiners have been in excess of the amount which the defendant major oil companies would have purchased apart from their participation in the alleged buying program, I can only speak for my own company. Speaking for Mid-Continent Petroleum Corporation, we bought only such gasoline as we needed, and we would have bought that amount of gasoline whether there had been any Tank Car Stabilization Committee or not, because our sales during that entire period ran greatly in excess of our ability to produce.

I did not ever intend to induce any independent to curtail his production of gasoline. It was no part of the plan I have described here that I or any other person was to induce or attempt to induce any curtailment of production by the independent refiners.

The indictment charges that the trade journals, namely, Platt's Oilgram, the Chicago Journal of Commerce and National Petroleum News conspired with us falsely to report the prices paid by the major companies as prices paid by jobbers. I did not ever report the prices paid by Mid-Continent in any buying that I have described as prices paid by jobbers. 2303

I never requested any representative of any trade journal to report the prices paid by Mid-Continent or by any other major company in making purchases as prices paid by jobbers.

I did not at any meeting of the Tank Car Stabilization Committee, or of the Sub-committee, or at any other meeting during 1935 and 1936, ever hear anyone suggest that the prices paid by the major companies were to be falsely reported by the trade journals as the prices paid by jobbers.

By Mr. Loucks

I stated that on March 7th, at our meeting at lunch with Jacobi and Tuttle, I was assigned to contact Barnsdall Refining Corporation. I presume it is a fact that I meant Barnsdall Oil Company.

By Mr. Brazeau

I testified that Mr. Merritt of Cities Service attended the meeting January 4th. I think that was Mr. William H. Merritt of Cities Service Oil Company, not of the Cities Service Company.

Cross-Examination by Mr. Lewin.

I undertook to keep in contact with Phillips, Standard
of Indiana and Barnsdall Oil Company. Whenever I
was active I carried out that undertaking and kept in
2304 contact with them each month. That was a Sub-
committee activity, and I have no recollection of
doing any contacting during 1936. I passed out of the
picture in December, 1935.

I contacted Barnsdall Refining Corporation in that way a few times after June 1, 1935. I contacted Mr. Julius C. Evans. I don't know what company he worked for.

During that period of a week immediately following the Schechter decision, I watched the papers very closely for anything in the newspapers that might bear upon the effect of the Schechter decision, upon the N. I. R. A. codes, and so forth. Our local papers were those that I watched. I subscribed to the Chicago Journal of Commerce and trade papers like that. I was out of town on June 7th. I may or may not have seen an account in the papers of June 7th and June 8th of a statement of President Roosevelt at his press conferences with regard to the necessity of enforcing the anti-trust laws.

(Paper shown witness.)

I was in Chicago on June 8, 1935.

When I am in Chicago, I read the Chicago Tribune but
not with the regularity that I read my home paper, and
I read the Chicago Journal of Commerce if I can get
hold of it. I usually look at the first oil page first. (Examin-
ing paper.) I don't remember that other article in
2305 the June 8 issue, the article on the front page headed
"President puts O. K. on trade profit" with sub-head
"Cautions against anti-trust law violations". I may have
read it.

(Newspaper referred to is received in evidence as EXHIBIT 904, and read to jury by Mr. Lewin.)

The Court: Let the record show that that same article was published in most of the papers throughout the country.

Mr. Donovan: That is Exhibit 904, your Honor, and that is admitted in evidence; is that correct?

The Court: Yes.

My company is a subscriber to Platt's Oilgram and to the Chicago Journal of Commerce.

I met John Steiger for the first time about three weeks ago. I don't believe I ever had any talks with him over the telephone before that time. I knew who he was; but he never called me. Mr. Fitzgerald and Mr. Smith in my office have communications with him. That is Mr. Thomas Fitzgerald, a defendant in this case. I am sure Mr. Fitzgerald and Mr. Steiger had some telephone conversations during 1935 and 1936. I don't know whether or not Mr. Fitzgerald was telling Mr. Steiger the prices that Mid-Continent Petroleum Company was paying on the spot market.

2306 I know Mr. Keith Fanshier, the petroleum editor of the Chicago Journal of Commerce. I was in communication with him during 1935 and 1936. I talked to him probably five or six times during that period. I don't know whether he makes up the price quotations that are contained in the Chicago Journal of Commerce for the gasoline spot market. I understand he has something to do with it.

The quotations in the Chicago Journal are one of the factors that we use in our jobber contracts in the Standard of Indiana territory. In arriving at the spot price provisions of our contract Platt's Oilgram quotation is the other factor.

I have no definite recollection of giving Mr. Fanshier the prices we were paying during 1935 and 1936. However, if he ever asked me what we were paying in the spot market, I would tell him. It has been my custom for many years. I really have no definite recollection on whether or not he asked me that.

I was not telling Mr. Fanshier about this plan, when I called him. Mr. Fanshier learned about the plan from someone other than me, because the first time that he and I ever discussed it, he called me and made some reference to the thing, so I never did tell him about the plan.

He had articles in the paper long before I ever talked to him about it. He appeared to be familiar with the plan when he talked with me.

2307 I don't believe Mr. Fitzgerald, my assistant, ever was in contact with Mr. Fanshier during 1935 and 1936. I think that is a correct statement. Mr. Fitzgerald wasn't acquainted with Fanshier. I talked with Mr. Fanshier; and Mr. Fitzgerald talked to Steiger. That has been our custom over many years.

I testified that at the meeting of our Committee on February 5, 1935, Mr. Bourque had a survey of distress gasoline which was discussed at the meeting. He had a list of independent refiners. My recollection is that the list that he had involved between 600 and 700 cars. That was the estimate of these independent refiners as to the amount of distress gasoline they would have for that particular month; it didn't mean that they had that much on hand right at that time. I don't believe the list showed what they had on hand at that time. I have no recollection of it, if it did. I am quite sure a number of the independent refiners had gasoline on their hands available for sale on February 5th, but the list did not purport to show that information. It was a monthly survey.

It is my recollection that the list covered 16 or 17 independent refiners, all located in the Mid-Continent field, as distinguished from East Texas. This was not a survey of illegal gasoline manufactured from hot oil that these companies would have on hand.

2308 I don't believe it is correct to say that at that meeting we discussed the possibility of having some 12 or 13 major companies purchase that amount of distress gasoline from these Mid-Continent independent refiners, or that I put it just that way. I said that we discussed at that meeting the fact that we felt there were some 10 or 12 companies who were regular and normal purchasers of gasoline, and that this Committee might attempt to put these purchasers in touch with the sellers, for the purpose of giving these independent refiners an outlet that already existed for their distress gasoline. These major companies were buying gasoline and had to buy gasoline, and, as I tried to explain, they had been buying it from just a few companies. Our plan contemplated trying to get them acquainted with some of the smaller and lesser known independent refiners.

In an indirect way I knew of distress gasoline in the Mid-Continent field other than that which appeared on the survey. I don't know whether there was any large quantity of it. We never had any idea as to how much it was, but one of the reasons the Sub-committee was set up was to take cognizance of anything that showed up that wasn't on the survey, and attempt to find someone who was interested in buying it.

Mr. Bourque made these surveys. I did not say that
our Sub-committee was set up to make monthly surveys.
I said the Sub-committee was set up to take cog-
2309 nizance of any additional distress that came to our
attention. We didn't go out looking for it. I didn't,
at least. We got that information through many channels.

Q. I ask you again whether the plan wasn't for some 12 or 13 major companies, that you say were fairly regular buyers of gasoline in that field, to buy this distress gasoline that appeared on the surveys from the independent refiners?

A. The plan was to attempt to get them to buy gasoline, if they needed it, from some one or more of those companies on that survey, yes, sir. The plan was to get them to buy up this distress gasoline that we were having surveyed, if they needed it. The plan absolutely didn't contemplate getting them to buy it, if they didn't need it. I think these 12 or 13 major companies are all among the defendants. They included: Standard of Indiana, Socony-Vacuum and Wadhams—we considered them as one company—Sinclair, Shell, Empire, Pure, Phillips, Mid-Continent Petroleum Company, Continental Oil Company, Skelly, Barnsdall Oil Company, later Barnsdall Refining Corporation, and Globe. Wadhams is in there and brings that up to thirteen. That is a complete list of possible purchasers we discussed at that meeting.

2310 Mid-Continent Petroleum Corporation about that time had fairly low storage stocks. All of the product that we ever purchase is shipped direct to bulk storage out in the field. None of it is shipped into refineries or terminals; so that we had to have storage facilities, or it would have to be put on the ground.

We had some storage available for gasoline at the bulk plants in January and February, 1935. At that time our storage wasn't full. That is a period of the year when our sales on the particular grade of gasoline that we purchase from independent refiners are comparably low. That would not necessarily be true in 1936. There was a situation existing in 1935 that I think was unusual right at that time. Our storage was low. Our sales were not low. The way we felt was low. The Panama decision had thrown the industry into chaos, and there were threats of a crude cut. The Panama decision had nothing to do with the storage space we had on hand at that time, but it had something to do with whether we could fill that space or not. I think we had some storage space. I don't recall, but at that time we weren't trying to fill it, so I don't remember.

I said that prior relationships and knowledge of particular independent refiners was the basis of the choices that most of these buyers made, as I remember
2311 it. For instance, I gave as illustrations Empire selecting Olney on that basis; Socony-Vacuum selecting Champlain; and Shell Company selecting Cushing on that basis. We wanted to buy from Cushing and Johnson Oil & Refining Company. We had a prior relation with Cushing and knew something about them and the quality of their gasoline. The same wasn't true with regard to Johnson. It was because we had sold them some crude and burning oils and other products for many years. That was the basis on which the initial sales were made. When purchasing actually started we and other companies bought from dozens of independent refiners. This survey that Mr. Bourque had showed an estimate of how much distress gasoline there would be in February, and the companies who said they would have it. The plan was that major companies were to be asked to buy it only as they needed it.

I did not say that generally storage stocks were low at that time. At the refineries the inventories were quite low because they had all been suffering from restricted refinery allocations through 1934, and the general level of inventories was down.

As far as I know, the stocks of the independent refiners weren't illegally produced and weren't manufactured from hot oil.

Q. Does anything occur to you to prevent any
2312 one of those major companies, if they needed that gasoline, from buying it individually from them as they had done just the week before in January and February, 1935?

A. I don't know what prevented them from doing it. Some of them were buying.

Mid-Continent Petroleum Corporation, my own company, made only one purchase on the spot market in the Mid-Continent field in January and February, 1935. That appeared as one of the little black dots on the chart of the Mid-Continent Petroleum Corporation that was offered in evidence here. It was just on there as a purchase.

In my opinion, there was a very good reason to prevent my company in January and February, 1935, from buying up distress gasoline from independent refiners in the Mid-Continent field with whom we had done business before. We were uncertain about the future of the industry. The Panama decision on January 7th had knocked the control out of East Texas, and markets were in a very chaotic condition. There were continual and perpetual threats of a crude cut. With that situation staring us in the face, we didn't care to buy gasoline at any price. If we needed it for any immediate current demand, we may have purchased it. We may have taken a little out of inventory.

2313 Here is the situation on what I mean by companies needing gasoline. A company doing business in large quantities as we do has to project their requirements beyond a week or ten days. And we often times buy gasoline that may not actually be sold out of the bulk plant for some little time, but we have to project for stock levels throughout the period of the year. It would depend on the individual policies and ideas of the various companies.

In January or February, 1935, we knew that we were going to have to buy gasoline that year. It was on the basis of the major companies needing gasoline that we assumed they could and would buy. The plan was that we weren't going to ask them to buy anything they didn't need.

There was distress gasoline for purchase in the hands of these Mid-Continent independent refiners in January and February, 1935. If there were major companies then who needed it, I presume they were buying. They were buying on the low, but it was going down. Often times you don't want to buy on a downward market. We were going to wait until we saw what happened to the industry. Obviously it would help the independent refiners more to buy it sooner and not to wait until the prices went lower.

2314 This Committee was assigned the job of making a study of a situation, and our plan was based on the control of hot oil in East Texas. And we didn't suggest the plan for operation until that was done. Of course it would have helped the independent refiner just as much for the major companies to have relieved him in January and February of his distress gasoline as to wait. We waited for the Connally Bill to pass, simply because that was the principle upon which the plan was suggested to Mr. Arnott, as far as the plan itself is concerned.

The reason why Mid-Continent wasn't buying in January and February may be entirely this: We buy, as I tried to tell you a moment ago, third-grade gasoline. We bought quite a little gasoline in December, 1934, and we just didn't need it.

It was necessary, in order for us to help the independent refiner, for us to have the Connally Act passed, because from a practical standpoint we felt until that was passed nothing would aid anything. Our whole reason wasn't just to help the independent refiner. We all felt that with hot oil slopping over into our territory, there wasn't any sense in attempting any stabilization effort of any sort. I mentioned the effect of the plan on the general stabilization and the retail markets. The stabilization committees were dealing with the retail price of gasoline.

2315 Q. So your idea was by this plan to help the independent refiner by getting the price up, isn't that right?

A. No.

Q. Well, was this help that you were giving the independent refiner merely taking distress gasoline off his hands, or was it to give him a better price for the rest of his gasoline, or both?

A. The primary purpose of the plan suggested by the Committee was to relieve this market of this unnatural pressure of distress gasoline.

Q. And by "market", you mean the market price?

A. No, I mean its ability to float on the market.

Q. Well, what would that do to the market price?

A. Well, distress gasoline has a depressing factor—one of the depressing factors on price.

Q. Yes. Now, I ask you this: How did you, as one of the principles of your objective, to help the independent refiner, did you mean to help him by simply taking off his hands distress gasoline that he didn't have a market for, or did you mean to help him by getting his price up so that he could sell the rest of his gasoline at the better price?

2316 A. I don't think we ever conjectured as to what that had to do with the rest of his gasoline or anything else. Our theory can—in my opinion—can be best illustrated by our attitude and our opinion.

Suppose we had a windstorm, and two or three trees blew down a telephone wire. One is a great big tree and

the other one is a small tree. That brings the wire down. Well, that is the situation with the market at the time we were making this study. The big tree was hot gasoline coming out of East Texas, which was sold at ridiculously low prices, a price that people operating on legally produced crude could not afford to compete with. The small tree might be illustrated by the distress gasoline that was in our own territory. It was a minor factor in this low price. It wouldn't do any good to lift that small tree off the wire, because the heavy tree would still be laying down. But if we take that big tree off, then that wire—if it hasn't lost its stretch—will probably resume a more normal level. That was the theory behind our study. That hot gasoline in East Texas was the primary factor that was causing this extremely low price of gasoline, but we recognized there was some homeless, distress gasoline in the Mid-Continent area, and there were people there who wanted to buy. This
wire which I said was depressed by the two trees was
2317 the price of gasoline that was depressed—the normal
price.

Q. And the object, you think, of both the Connally Act and your plan was to remove these two trees so that price would go up?

A. Well, we knew the result would be that.

We didn't have anything to do with the Connally Bill. The object of our plan was to remove the small tree. It was not the object of our plan to remove the small tree in order to get the price to go up. We felt that we knew that if the Connally Bill was passed and the Tender Board was put back into East Texas, the price would go up because that had happened in October, 1934. When the first Tender Board was put in, the price of gasoline went up about 2¢ a gallon in less than 30 days. We had that in the back of our mind. We didn't know, but we felt, that if the Tender Board were put into East Texas again, the gasoline prices would seek a more normal level, because the refineries in East Texas which had been running on hot oil would have to run on dollar crude, and they would have to compete on that basis with the refiners in other areas.

Our plan was not addressed to handling this hot oil situation. There was no appreciable amount of hot oil in Oklahoma. Our plan was designed to handle distress gasoline.
The Connally Act was the thing that was going to
2318 take care of the hot oil situation and did take care of
it. Our plan wasn't to take care of the hot oil situation at all, but it was tied into that.

The object and result of the plan wasn't to remove the distress gasoline in order to get the price up in the same way that the Connally Act was removing hot oil in order to get the price up. The purpose of our plan was not to help the major companies. Any part that this plan might play in helping to stabilize the retail price structure would help the jobber. The major company refiner naturally would profit by any stabilization of markets, and by "stabilization" I mean increase in prices in this particular instance. It does not always mean this.

I am vice-president in charge of sales of my company. I think the gallonage of gasoline sold by my company in the Standard of Indiana territory during 1935 was around 200,000,000 gallons. In 1936, it was about 10% more than that. That would be 220,000,000. That is sold to jobbers under this contract that I have described. It is sold also through our own retail stations to consumers, to dealers in the Standard of Indiana territory, and to large consumers directly.

The basic price with our contract sales is determined by the spot market quotations in the Chicago Journal of Commerce and Platt's Oilgram, the Oklahoma 2319 edition.

In the retail sales we follow substantially the normal retail service station price fixed by Standard of Indiana in the Standard of Indiana territory, but we meet competition in the retail market, whatever it is.

An increase in the tank car quotations published by the Chicago Journal of Commerce and Platt's Oilgram of 1¢ in the years 1935 and 1936 would be in excess of $4,000,000 to my company. If the tank car price published there should be raised 2¢ on an average for that period, it would be twice that. We would get in excess of $8,000,000.

Q. So that your company was very vitally interested, wasn't it, in whether the quotations were as published in the Chicago Journal of Commerce and Platt's Oilgram?

A. Yes, we were interested in making a profit.

Q. Now, I ask you again whether this plan that you had of removing distress gasoline, which was a depressing effect as you say on the tank car price, was not to help major companies, including yours?

A. Well, the Committee was not appointed for that purpose and it did not make its study for that 2320 purpose. The plan was for the purpose that I have described. Now, we as part of the industry very naturally profited to the extent that the industry reached stabilized and improved conditions, but we could not avoid doing that.

Q. You could not avoid doing that? You thought it was just a by-product of your efforts; is that right?

A. Well, Mr. Lewin, I did not go into the effort to raise the price of gasoline for my company.

Q. Look here. Didn't you know and didn't all the rest of you know, who met in those meetings, that the basic price for the millions of gallons that those companies were selling in the Standard of Indiana territory was fixed by those journals? Didn't you know that and didn't the rest of them know that?

A. Yes, I knew—

Mr. Donovan: I object to that characterization, "fixed by those journals".

The Court: Objection overruled. Exception allowed.

The Witness: (Continuing answer to last question) —that the quantity of our output that was sold 2321 on jobber contracts the price was based upon the Journal prices.

Q. And didn't you know and didn't they know that that quantity of gasoline that they sold in 1935 and 1936 at retail was also based upon the Chicago Journal of Commerce and Platt's Oilgram quotations for the tank car market?

A. Well, I don't know how we would know that, because the retail prices were competitive, and they were many different things.

Q. Didn't you know that throughout that period beginning in March, 1935, before that really, and running down through 1935 and 1936, that the normal retail service station price published by the Standard of Indiana and followed generally by the other major companies, ranged about 5½¢ above the published tank car prices in those journals?

A. Yes, sir, I knew that their normal price was about that.

Q. And didn't you know that when the tank car price as published in those journals went up and stayed up, that you would get very soon a corresponding rise in the retail price, normal retail price?

A. We assumed that. We had no right to know how long that could exist.

2322 Q. Then I say that with regard to all those millions of gallons that this group of major companies were selling in the Standard of Indiana territory, an increase in the tank car price meant just so many dollars in their pockets. Isn't that right?

A. Well, if we had been asked to look at it that way we probably would have considered it.

Q. Do you mean to say that you, and other men, high executives of those companies, have not ever considered that factor?

A. Yes, we probably did.

Q. You probably did.

A. I knew it, but what I am trying to say is we did not sit around and talk about it.

Q. No, that was one of the kind of things you would not want to talk about too much. You would rather talk about helping the independent refiner, wouldn't you?

A. No, no. I would be just as willing to talk about that as—

Exhibit 339 is a letter from me to Mr. Smith of the National Refining Company, dated April 17, 1935. At that time our plan had been in operation just about a month. Charles S. Smith is the vice president of National Refining Company, which is one of the smaller semi-major 2323 companies. I don't know how you would classify them. It has headquarters at Cleveland, Ohio. I think it does business throughout this Standard of Indiana territory pretty generally.

Redirect Examination by Mr. Kirkland.

I know Mr. Allan Jackson, vice-president of Standard of Indiana. He is one of the defendants in this case.

I spoke about a meeting on January 5, 1935, in Mr. Bullock's office. Mr. Bullock is also an officer of Standard of Indiana. I am quite positive that Mr. Jackson was not at that meeting.

I stated that after I returned to Tulsa in March, 1935, shortly after, or a few days, whatever it was, I telephoned Mr. Bullock in Chicago.

I kept in contact with Standard of Indiana principally through telephone conversations with Mr. Bullock during the early part of 1935, along in the summer and fall. Of course, I was away quite a lot. Frankly, I got so little satisfaction out of Mr. Bullock in some of my conversations that I wanted to save the telephone expense, so I just quit telephoning him.

By Mr. Donovan

At the time the plan was discussed and suggested our principal purpose was to make some suggestion that 2324 we thought would assist the entire industry in getting out of the red and into profitable operations in line with what we knew to be the general objectives of all code authorities and the Government and the industry itself. In fact the Code, as I said yesterday, provided for a parity between gasoline and crude.

In the progress of my work in this stabilization committee, I did get in touch with a few other major companies. The ones that I personally talked to were Tide Water, Anderson-Prichard and National Refining Company. I did not put National Refining Company in touch with any independent refiner because they did not respond to my salesmanship. I think Tide Water bought a few cars. I am not positive about Anderson-Prichard. I think they did, but I don't know.

Mr. Donovan: Your Honor, I would like to have this marked for identification. I think your Honor said yesterday in our part of the case I would be permitted to put in this statement that I submitted to you as part of the newspaper account.

Mr. Chaffetz: Without arguing the question again, we object to any more newspapers.

The Court: I think we have had enough. Objection sustained. Exception allowed.

2325 Mr. Donovan: May I have it marked?

(Document referred to marked Exhibit 907 for identification.)

Recross Examination by Mr. Lewin.

I would not say that I tried to get National Refining Company to come into the plan. I suggested at one time that if they wanted to buy gasoline I could tell them where some distress gasoline was available. I did not get any response. National Refining Company was not indicted and is not a defendant in this case.

Redirect Examination by Mr. Donovan.

I don't believe I said that Mr. Bourque was present at all the meetings of the Tank Car Stabilization Committee, but at those at which he was present, he was there at our invitation to bring this current list of distress gasoline.

2326 Mr. Donovan: I desire to introduce a stipulation entered into between counsel for the defendants and counsel for the Government, under the title of this case, and Exhibit A attached thereto relative to the gasoline production and sales of Rock Island from January 1, 1934, to December 31, 1936, inclusive.

I offer that stipulation, together with Exhibit A, in evidence.

Mr. Chaffetz: No objection.

(Documents referred to received in evidence as EXHIBIT 895.)

Vol. III — pp. 1229 to 1890

2327 **SAMUEL F. McCLUNEY**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am employed as chief accountant by Sunray Oil Company, Tulsa, Oklahoma, an independent refiner, and was so employed from 1934 through 1936. The refinery is located in Allen, southern Oklahoma.

During each of those years, 1934 to 1936, our company sold small quantities of gasoline to major companies, about 2% or 3%. These sales were for local shipments, on account of freight advantages. The balance of our sales was to brokers and jobbers on the spot market, not under contract. This gasoline sold to jobbers and brokers was sent into the Mid-West and North.

During this period I was in charge of and am familiar with the regularly kept books and records showing production and sales of gasoline. I have a schedule I prepared from the records for the years 1934 through 1936, showing the monthly production and sales in gallons and the total for each year. It is practically all regular grade gasoline.

The production by years is: 1934, 11,595,721 gallons; 1935, 20,679,713; 1936, 24,852,696. The sales: 1934, 11,787,190 gallons; 1935, 20,556,544; 1936, 25,022,275.

(Schedule referred to marked EXHIBIT 896, and offered and received in evidence.)

2328 *Cross-Examination by Mr. Lewin.*

I don't know whether or not I am familiar with the Standard of Indiana territory. We sell most of our gasoline in Indiana, Ohio, Missouri, Illinois and those states. We sell very little in Oklahoma, some in Nebraska, and some in Wisconsin.

F. L. Martin was in charge of sales of Sunray Oil Company in October, 1935, but I don't know whether he was vice-president at that time or not. He is vice-president now. His initials are F.L.M. He has a secretary with the initials D.D. Her name is Daisy Duckworth.

Our company, Sunray Oil Company, is not named in the indictment in this case.

2329 **GEORGE J. PETERSMITH**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is El Dorado, Kansas. I am employed as chief accountant by El Dorado Refining Company, an independent refiner. The refinery is located at El Dorado, Kansas.

From 1934 through 1936 I was in charge of and am familiar with the regularly kept books and records showing the production and sales of gasoline.

During those 3 years, our company sold very little gasoline to major companies, less than 1%, and none to brokers. We sold gasoline to jobbers during those 3 years in Kansas, Colorado, Nebraska, Minnesota, Iowa, Missouri, Illinois and South Dakota.

Our gasoline production for 1934 was 859,854 barrels; for 1935, 903,032 barrels; and for 1936, 937,834 barrels. Our gasoline sales for 1934 were 914,842 barrels; for 1935, 876,035 barrels; and for 1936, 948,670 barrels.

I have prepared a schedule breaking down these figures into months.

(Schedule referred to is received in evidence as EXHIBIT 898.)

No Cross-Examination.

2330 **JOHN C. MARSHALL**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Kirkland.

My address is Chicago, Illinois. I am employed by Standard Oil Company of Indiana in its general Chicago office as assistant to the general manager of sales. I am 57, and have been with Standard Oil of Indiana more than 32 years. I started in the office of the general manager of sales as a clerk and stenographer. When I took that position, there was only one other employee in the department. As the department grew I was in charge of it, under the general manager. I became secretary and assistant to the assistant general manager. I finally became a field assistant.

As a field assistant I traveled throughout the territory, inspected the properties, investigated the sales situation and discussed the sales problems with the managers and their staff.

In the latter part of 1919 I became manager at Grand Rapids, Michigan. The manager in a place like Grand Rapids has entire charge of the operations in the territory from every angle. His duties are to see that sales are made, and everything is operated as economically as possible, in the best interests of the company and in conformance to the policies and the prices that are given
to him from the general office. He is mostly in the
2331 sales end, although he has certain operating prob-
lems. He has nothing to do with the buying of the gasoline; everything is furnished to him.

I was in Grand Rapids, Michigan, for two years. In the latter part of 1922, I went to Indianapolis as manager. I was there until April, 1929.

Then I became an assistant general manager, and as such I was in charge of sales in some of what we call our grand divisions. We have 4 grand divisions: the Northern Division, the Western Division, the Central Division and the Eastern Division. That is a split-up of 28 main stations or territories. The sales in those 4 divisions were not under me, only 1 of them at a time. I first went out to the Western Division, and later into the Northern Division.

That brings me down to the latter part of 1935. In October, 1935, I was appointed assistant to the general manager, which brought me into the general office, where I was permanently located, and I didn't do any more traveling to speak of. Due to some special assignments which I had to finish up, I didn't actually get on the job until the end of the year. I have held that position down to the present day. I occupy it now.

My 32 years with the Company have been spent almost entirely in the sales end, with the exception of 2 or 3 weeks in my first years of employment when I was temporarily in the Purchasing Department.

During my entire experience I have come in very close
contact with the different methods of competition
2332 that prevailed among the major oil companies in
the Mid-West territory, or what is called the Standard of Indiana territory, ever since there were other major oil companies.

I know or have a general knowledge of the names of the major oil companies who are indicted in this case.

There has been at all times during the period of 1935 and 1936 very vigorous competition between the major oil companies in the so-called Standard of Indiana territory; not only between Standard of Indiana and other majors, but between the majors themselves, for dealer outlets, primarily. By "dealer outlets" I mean service stations not owned or controlled by the companies themselves. I mean garages and other places that sell gasoline; independent service stations that sell the branded products of the major companies. There has also been, during the same period, quite vigorous competition between all of those majors for consuming business, both farm business and industrial business. By "consuming business," I don't have in mind the man who buys for his automobile. I had in mind the farmer, who buys either for his automobile or for his stationary engine or his tractor, or his kerosene for the farm, and all that sort of thing.

That competition in 1935 and 1936 probably was more severe than at any prior period. I do not know of any of the major companies, that I now recall, that do business or did business in those 2 years in the Mid-Western area, that didn't engage in that competition. They
2333 were all at it, anxious to secure outlets and increase their business, undoubtedly. During those years, they took dealers away from each other, there was a certain transference of dealer business at all times. We lose some dealers to various majors or to jobbers, and we occasionally pick one up here and there.

The farmer and the consumer business is what is known as tank wagon distribution. As to how that competition was evidenced, our agents and drivers would go out over their customary routes and solicit trade whose business they might have been enjoying, and they would be confronted with the statement by the customer that he wasn't going to buy their product any longer, because he could get a similar product from somebody else at a lower price. Sometimes that someone else was a major company, and sometimes an independent oil company. Jobbers operate tank wagons.

In the years 1935 and 1936 I was familiar with the method by which Standard of Indiana arrived at its selling price to the consumers and also to the service station and tank wagons. After 1935 that was in my particular line of duty. I was familiar with the price structure at all times for that was a very important element of my work.

By Mr. Crawford

The policy I refer to, how Standard of Indiana arrived at its selling price of gasoline to the consumer, to the service station and to the dealer in 1935 and 2334 1936, was not necessarily represented by any written or printed document. I wouldn't think so. There was a recommendation made when this method was originally established, and quite possibly there might have been a memorandum made that it was approved, although I am not aware of that myself. I have nothing in my possession—I know it was approved and it is in existence. I can't tell you about anything written on the subject. I say there is not, within my knowledge.

By Mr. Kirkland

The fundamental basis of this price policy is to take an average of the averages of the low prices quoted in Platt's Oilgram, either Chicago or Oklahoma quotations, and the corresponding price for Oklahoma quoted in the Chicago Journal of Commerce, and add that to a certain differential or spread or margin, or whatever you may choose to call it. To that is added freight to destination, and applicable taxes. That gave our service station price, when we had a service station price. Since that time, we have been making a tank wagon price.

In the early part of 1935 the Company operated some service stations of its own. The Company was then in the retail business as well as the wholesale. The original date when we discontinued posting service station prices in a portion of the territory was July, 1935. That was in Iowa. That was where the plan became known 2335 as the Iowa Plan; it originated in Iowa. And from then on, the Company proceeded to dispose in some way, or get out of the retail business entirely; it followed that Plan, and ultimately discontinued posting service station prices all over the territory. It discontinued posting service station prices when it had no retail outlets of its own to post them in. After that, when it had no retail service station outlets of its own where it could post service station prices, it posted prices to dealers, and the prices to tank wagons, at the bulk plants. Standard of Indiana has bulk plants scattered throughout the entire area. It has approximately 4000 of them in the 10 States of the Middle West.

As to how this formula or method of arriving at the price was determined upon:—as Group 3, or products coming out of Group 3, increased in volume and became more

and more competitive in the territory, it appeared to our Sales Department that the then existing method of arriving at our price structure was no longer suitable and applicable, and it resulted in our having a rather chaotic condition, due to the very large number of sub-normal or cut prices. It was a very difficult situation to follow, because at many times we had approximately as many cut prices as we had normal prices. Realizing that the greater part of the competition was coming out of the Group 3 area, it seemed logical, fair and reasonable to the members
of the Sales Department that the normal price struc-
2336 ture should be predicated to some degree, at least,
upon the published quotations in these trade journals of the spot market. In other words, Standard had found itself being undersold in that particular part of the area. So then they used what you might call, in arriving at this new price, a different base from what they had previously used.

On January 1, 1935, the base used was the average of the averages of the quotations on house brand gasoline in Platt's Oilgram, either Chicago or Oklahoma, whichever was lower. The base was really the spot market, but we arrived at it in a different way. Our base, beginning in January, 1935, was the spot market. In January, 1935, we determined what the spot market was by taking the average, first of Platt's Oilgram, Oklahoma or Chicago market, whichever was the lower. Assuming that Platt's Oklahoma market was a little lower than Platt's Chicago market on December 1st, let us say, we would take the Oklahoma market, but the contrary was usually the case. Usually it is the other way. We would average that with the average of the high and the low in the Chicago Journal of Commerce, and the average of the two of them gave us the base from which we started.

I used the average of the averages as the beginning in 1935, because early in 1935 we changed to the average of
the lows. It was either late in January or early in
2337 February; it runs in my mind that it was late in
January, 1935. Anyway, we got the spot, and we started with that. To that you add the taxes, Federal and State, whatever taxes apply to it; that is a necessary part of the computation on all prices. And you add the freight from Tulsa to wherever the gasoline goes. To get the price to the service station and the consumer, at that time, we added 5½¢ per gallon to arrive at the service station price.

That figure of 5½¢ was determined after very exhaustive computations of prices then existing throughout the territory generally, and it was found that those prices bore a relationship, approximately, of an average of 5½¢ above the spot market, Group 3 figure, as indicated by my previous statement. That was then considered by our people, and they decided, as long as the computation showed that situation, they were willing to experiment with it to see whether it was a satisfactory method of building the price. It gave us a price that was more nearly in line with competition, but in spite of that price, we still had many subnormal or cut prices. That is how we got the average—some above and some below.

Q. In other words, in determining upon that method which you have just described, you took into consideration the number of subnormal or cut prices existing in the territory for some time previous to the time you meant it for, is that correct?

2338 A. For the sake of accuracy, I would say we took into consideration the actual number of cut prices. We took into consideration other things that enter into competition.

As described, this method was first put into effect on September 11, 1934. And it was in effect, with the exception of going from the average of the averages to the average of the lows of the Journal all through 1935 and 1936. As a matter of fact, the sales department had been promoting the idea, an idea of that kind, for several years. I think we first started promoting it in 1925. During the interval from 1925 to 1934 suggestions had been made to the executives about the change.

At the time the change was made in September, 1934, no executives or officials or employees of any other major oil company were consulted by Standard before making it. We considered that a very confidential matter.

The spot market changes, of course, from time to time. We recommended and were authorized to make our changes only if necessary or desirable when the spot market had gone up or down and stayed thus to the extent of at least 3/10¢ a gallon for a period of 7 days or more. It is a rather burdensome job to change the prices in 3000 bulk stations. Many of them don't get their mail every day. And we needed the period to determine whether it was right or proper and whether competition would permit us to make the change. In other words, we wait 7 days.
2339 It wouldn't be a practical thing to follow all the variations of the spot market, because it goes down ⅛¢ one day and another day it goes back ⅛¢. We usually didn't determine that we should make the change until the

7 days had elapsed. Then it would take some days to put it into effect. It would be 8 to 10 days on the average after the condition had been established. We would have to notify all our bulk plants; we have to prepare these price postings which are put up. In 1935 we had to notify service stations when we were operating service stations.

There is nothing sacred about it. It is purely an internal affair of the Standard of Indiana Company. There have been occasions when we haven't changed. Not always have we changed it exactly in accordance with that formula as described. As a matter of fact, as already expressed to you, we changed the method of arriving—or computing the average prices at Tulsa—we have since changed them the second time, and we have changed in addition this margin or spread that we used. 5½¢, we have since changed. And of course, you appreciate that we never are exactly on this 5½¢, unless it be merely a matter of coincidence.

Assuming that sometime during 1935 the spot market went up 3/10¢ for 7 days, in determining whether we will increase our base so as to change the retail figures, we take into consideration this spot market merely as a starting point. I might say it is a peg to hang the price
2340 structure on. The fundamental in our price structure is necessarily competition, as it necessarily is in relation to all products which we distribute and use. In determining whether we will keep up with a 3/10¢ change and follow the market, we certainly take into consideration whether competition will permit it.

My recollection is we changed the base four times, 3/10¢ at a time, in arriving at our retail figures during the period from about March 8, 1935 until somewhere around the first part of June, 1935, when the spot market according to the quotations of the journals went up about 1½¢. In making that change we certainly took into consideration the question of competition; competition was very extreme at that time.

I think my recollection is that in the early part of 1935, January, February, and the first few days of March, the spot market price was unusually low. I don't know actually what the market did 6 months prior to March 1, 1935. My recollection is that it had gone down and had been considerably depressed during that period from former high levels, but I wasn't watching the spot market.

As far as the retail price is concerned, the effect of our change in method of computing the retail price, effective September 11, 1934, was an average reduction of 1.6¢ per gallon throughout the entire territory. That wasn't 1.6¢

everywhere. It would be considerably more than that
2341 in some places, and less than that, but by and large over the territory the average reduction was 1.6¢. There may have been a price change in the meantime during the 6 months prior to March, 1935. I have a memorandum that would refresh my recollection if I may refer to it. I am not entirely clear as to all these dates. There was this average reduction of 1.6¢ on September 11, 1934, and there was a further reduction of 3/10¢ on October 20, followed by an advance of 3/10¢ on November 13, so these two washed themselves out. On February 2, 1935, there was a reduction of 3/10¢. That was followed by the four 3/10¢ advances that I spoke of previously, the last one being on June 14, 1935. The net reduction for the 6 months prior to March, 1935, was 1.9¢ per gallon.

In 1934, 1935 and 1936, the company kept records of subnormal prices in effect at its service stations or at its dealer stations or in its tank wagon prices. Whenever we post or authorize a subnormal price, we get a report from the field showing the date on which that subnormal price was put into effect. We keep those records together, and at certain periods, usually the end of the month, we compile them, and we have a composite statement, which shows the total number of price cuts, from tank wagon and service stations where we post a service station price, and then we break it down as to how many price cuts were between 1¢ to 2¢; or 2¢ to 3¢; or 3¢ to 4¢.

2342 Our managers are authorized only to sell at the normal prices, unless they can produce some acceptable evidence that the price is being reduced by some competitor. If that condition existed in Madison, then he would either make a purchase at that price and secure a receipt, or he might take a photograph of the price sign, or he might secure an affidavit from someone who had made a purchase. They would submit that to the general office, and it would come into my department. I would review it, and if I was convinced, in my own mind, that a real necessity existed for us to meet that competition, and thought that the evidence was satisfactory, I would authorize them to meet that price.

As to the purpose in collecting this evidence, aside from showing it to the main office, it isn't a practical thing to allow all of your field representatives to make their own price at their own discretion. In some states we have price laws which we comply with, and we want to be in a position to show why if we are compelled to reduce our prices from normal. Then, generally speaking, under the one-price law you have to sell at the same price to everybody in the same class in the area. The freight is the only allowance. You are privileged to meet competition in the one-price states. So one of the purposes in collecting this evidence is to show that you are not violating the law.

2343 A record is kept of that particular subnormal price, or a price cut, in my office, as well as in the field office. When I refer to a subnormal price, I mean I had to meet a lower price being made by some competitor. I don't know just how far those records run back. I know they run back 8 or 10 years. In 1934, 1935 and 1936 they were kept under the supervision of my superior. But since 1936 they have been under my personal supervision. I have access to them.

A few moments ago I stated how a subnormal price to meet competition with the tank wagons going out from our bulk plants operates. Our driver or agent might have been unable to make sales. His trade, being a long-time customer, will usually tell him why. It is usually because the customer can get gasoline from a competitor company at a lower price. If that condition persists, and our man is losing his business on which he is dependent for his livelihood, he makes every effort to secure some evidence, because he knows we won't act on conversation. It is becoming increasingly difficult to secure this evidence, but we eventually get it, as a rule, and then it is submitted, as I have described before, and I use my discretion.

Records are kept of the tank car cuts, the same as service station cuts.

I have made a tabulation for the years 1934 and 1935 showing the tank wagon subnormal prices in effect at our bulk stations and also showing the service station subnormal prices in effect at our service stations. These

2344 tabulations I made from the records of the price cuts in the office of Standard of Indiana. I have the records here available to the Government. I have some samples of the evidence on which some of them were based.

(First page of document entitled "House Brand Gasoline, Number of Subnormal Prices, 1934," marked Exhibit 910 for identification.)

(Second page of document entitled "House Brand Gasoline, Number of Subnormal Prices, 1935," marked Exhibit 910-A for identification.)

(Third page of document entitled "House Brand Gasoline, Number of Subnormal Prices, 1936," marked Exhibit 910-B for identification.)

(First page of document entitled "Third Grade Gasoline, Number of Subnormal Prices, 1934," marked Exhibit 911 for identification.)

(Second page of document entitled "Third Grade Gasoline, Number of Subnormal Prices, 1935," marked Exhibit 911-A for identification.)

(Third page of document entitled "Third Grade Gasoline, Number of Subnormal Prices, 1936," marked Exhibit 911-B for identification.)

(Document entitled "House Brand Gasoline, Number of Subnormal Prices to Dealers, 1935 and 1936," marked Exhibit 912 for identification.)

(Document entitled "Third Grade Gasoline, Number of Subnormal Prices to Dealers, 1935 and 1936," marked Exhibit 913 for identification.)

On Exhibit 910-A, headed, "House Brand Gasoline, Number of Subnormal Prices, 1935," the column on the left is headed "as of" and then follows pretty generally the month, with the last day of the month. That means that this is the number of subnormal prices we had at tank wagon distribution as of January 31, 1935. And the number represents the number of bulk stations.

2345 "T W," in the next column, is the abbreviation for tank wagon price to consumers. As of January 31, under "T W" I have the figures 370. That means that the price for delivery by tank wagon out of 370 of our bulk stations was subnormal. We determine it on this Exhibit by bulk stations. Each bulk station is a unit, regardless of how much territory it covers. There were 370 bulk station units as of January 31, 1935, where they had in effect a subnormal price to meet competition.

There is no fixed number of towns taken care of by one bulk plant. They probably average about 5 circuit points to each bulk plant. At Madison there happen to be only 2. We have a bulk plant in the City of Madison. Outside of Madison that bulk plant services only 2 towns for Standard of Indiana. One is McFarland; and the other is Verona.

If you have a subnormal condition prevailing in Madison, that necessarily follows in McFarland and Verona as far as the tank wagon price is concerned, and also in the rural, and the parts surrounding. By the rural, I mean the territory that the tank wagon travels through selling gasoline. If we were confronted with tank wagon competition, as frequently happens in the rural areas, it would not be a logical thing and it would not be a practical thing to reduce our price in the rural and not reduce it in the City of Madison.

2346 Mr. Chaffetz: May I interrupt. He doesn't mean to say that all the gasoline sold out of bulk plant is cut when that—

The Witness: Only that gasoline that is sold by tank wagons.

If you meet a condition in McFarland where you have to cut the tank wagon price to meet competition in that town, that tank wagon price is cut in Madison and Verona at the same time, whether there is any condition existing in Madison or Verona that requires it. So that when you have 370 tank bulk station plants or bulk plants where you have to reduce the normal price to meet competition, that may include, and probably does include, 5 or 6 towns and cities to the extent of 5 or 6 times 370. All the rest of the column means the same thing.

The heading of the next column, the initials "S S", is an abbreviation for the service station price, which is the retail price to consumers. A total of 497 as of January 31st means that there were 497 towns in bulk station points at which our service station prices were sub-normal. Each town is regarded as 1, without reference to the size of it. Take the widest comparison you can have: the city of Chicago with many hundred service stations and dealers. It is only counted as 1 on this Exhibit 910-A. And if the cut were in the town of Verona, it would still appear just as 1. So that 497 places where we had at least one or more subnormal prices in our service station or with our
2347 dealers probably would include a considerable number of the larger cities. And in any one of those cities, there might be only one cut, but 200 or 300 outlets.

We once made, in an experimental way, a cut in part of Chicago and not in another part, limited to an area out on the south side close to the Indiana line. But it was not a satisfactory experiment and it only lasted a very brief period. So that if we make a cut it includes the whole city.

The City of Madison and the towns or villages of McFarland and Verona each would be an individual problem in that 497 from the service station price standpoint. A cut made to meet competition in Madison service stations would not be effective in Verona, unless we secured evidence in Verona. A service station is a fixed post. We feel that we are compelled to give all dealers, and consequently our own service stations when we operate them within a municipality, the same price. But just because we have reduced retail price in Madison, we do not consider it necessary to carry it out to McFarland or to Verona when that condition exists in Madison. It isn't very long, as a rule, before some other oil company operating in Madison feels it necessary to carry it out to one of these other places and then we meet the price.

If it existed in all 3 of these places, Madison, McFarland, Verona, it would still appear as 1. In any city where the tank wagon service extends to 4 or 5 or 6 circuit points,
other towns, if the price cut prevailing in each of the
2348 5 or 6 circuit points, it would be counted here only
as 1.

Exhibit 910-A shows 497 subnormal prices, not 497 service stations. They may be scattered over a large part of the so-called Standard of Indiana territory; I have those details.

The next column, headed "1¢ or less," means that out of the total 370 subnormal tank wagon prices, 363 of them were 1¢ or less. 388 service station prices were 1¢ or less below the normal out of a total of 497.

In 4 tank wagon stations the subnormal price was 1¢ to 2¢. 72 service station prices were 1¢ to 2¢ sub-normal.

3 tank wagon, and 25 service station were 2¢ to 3¢. There were 2 service station prices where the reduction was over 4¢.

These other Exhibits for the years 1934 and 1936 are made up on identically the same basis. I have the year 1934, for instance, both for house brand and third grade. House brand is known as regular gasoline, generally accepted as such. Standard Red Crown is our brand. The third grade is Stanolind.

The third grade is the grade in which we meet more competition. In June, 1934, under the heading "Total Tank Wagon," I have 1,090.

When I talk about sub-normal prices, I mean prices that
are below the normal price which Standard Oil Com-
2349 pany of Indiana has established. And the normal
price we arrive at by taking the spot, plus the freight,
and so forth.

Referring to Exhibit 911 for identification, which is the third grade gasoline for the year 1934, in June we had 1,090 bulk plant units where we had to meet competition by lowering the price. These figures mean that they were in effect in those months. We had 1,353 bulk station units where we had to reduce the service station price to meet competition.

This Exhibit shows that as to the service station, there were 127 in that month where the competition was selling at 4¢ or more under our normal price. And as to the tank wagons, there were 65 bulk wagon units where they were selling at 4¢ or more under our normal price.

And as to the 3¢ to 4¢ reductions, there were 199 bulk plant units, where the competition was selling at that reduction. And there were 177 service stations where the reduction was 3¢ to 4¢ below our normal price.

And then the Exhibit also shows 1¢ or less, and from 1¢ to 2¢, and from 2¢ to 3¢.

In June, 1934, we had 1,090 bulk plants where we had to meet reductions, and probably all of them held over into July. There were that many in June and in July, where we had to meet reductions. In other words, we had to add 147 additional units during July, which increased the total
to 1,237. The Exhibit states that in July, 1934,
2350 there were 109 bulk plant districts where we had to
meet competition, where the reduction was 4¢ or more under the normal tank wagon price.

There were some of those reductions on third grade gasoline in 1935 and 1936 up to as high as 5½¢ or 6¢. I don't recall that there were any, although there might have been an odd one over 6¢. About 5½¢ to 6¢ was about as high as they got.

As to the service station reductions in July, 1934, there were 148 bulk plant units where we had to meet reductions of 4¢ or over.

According to Exhibit 910 for identification relating to house brand gasoline for the year 1934, in the month of November, 1934, we had 550 bulk plant units where we had to meet price reductions. Those, of course, included on an average of 5 to 6 towns. We had 1,288 service station reductions, which might include a town with 200 or 300 outlets that were affected.

In 210 of those service station incidents, we had to meet a cut of 4¢ or over from our normal price. And we had to meet a cut in 110 instances of 3¢ to 4¢ below our normal price. And a cut in 234 instances in service station prices of 2¢ to 3¢ below our normal price. And in 294 service station places, where we had service stations in
those 294 bulk plant units, we had to meet a cut of
2351 from 1¢ to 2¢ below our normal price.

I have Exhibit 912 for identification, headed "House Brand Gasoline, Number of Subnormal Prices to Dealers, Year 1935 and 1936." I start there as of July 31st in 1935 instead of as in the other instances in 1934, because, as I have previously explained, July, 1935 was the first month when in any portion of the territory we ceased to post a service station price and posted a dealer price. That state was Iowa, where we had gone out of the retail business entirely. An additional 7 states came in under the Iowa plan in September 1936, and the other 2 states came in October 1st. That accounts for the jump from 13 to 406 subnormal prices. Until August 1st, these figures cover only Iowa. Now, on September 30th they cover all states except North Dakota and Illinois.

When I say that, as of July 31, 1935, there was a total of 27 subnormal prices to dealers on house brand gasoline, that should be added, on Exhibit 910-A, house brand gasoline for 1935, to the service station price to make the total cuts in that class of business. So the total cuts as of July 31st, for instance, would be 107, as shown on Exhibit 910-A, plus 27 as shown on Exhibit 912 for identification.

On August 31, 1936 we had 13 of these dealers that should be added to the service station cuts on the other Ex-
2352 hibits; and as of September 30th it goes to 406, because at that time in 7 additional states we had ceased to post service station prices. Out of those 406 there were 280 instances where we had to meet a cut of from 1¢ to 2¢. And there were 12 where we had to meet a cut of from 2¢ to 3¢.

(Schedules previously so marked for identification are received in evidence as EXHIBITS 910, 910-A, 910-B, 911, 911-A, 911-B, 912 and 913, respectively.)

In 1935, before the Iowa Plan, our Company had approximately 4000 service stations. The meeting of these subnormal prices, as shown on these Exhibits, by Standard of Indiana reached very substantial proportions.

This record that we have just read speaks for itself on 1935 and 1936. There were a substantial number of price cuts at all times. Even after we had established this new method on September 11, 1934, we were not able to maintain the normal price structure throughout the entire territory. I don't recall any occasion when the so-called normal price structure lasted any length of time throughout the entire territory. We may have established the normal for a few days, but inevitably in a few days we were compelled to meet competition somewhere.

Unfortunately, some of these subnormal prices stay in effect a year or more. Conditions don't change a
2353 great deal. When a subnormal price is in effect, somebody has got to lead off in a rise or an increase in the price towards normal, and most frequently it is

Standard Oil Company of Indiana that does it. That is fairly logical, because, with the wide distribution and acceptance of our product, it is hardly to be expected that other people could sell at a higher price than we sell at, if we stayed below them very long. Then we also regard the situation from that standpoint the same as we do in meeting competition. When the competition is removed, if it is removed, we feel privileged to and our duty is to advance the price correspondingly. It is our object, at all times, to sell our product at our own established normal market.

When we cut our price at a service station to meet competition in any town, we also cut the price to dealers in the same town or city. When we had dealers, they were competitive with our service stations, and they are competitive with all other service stations; and necessarily they are entitled to the benefit of the same price. They are in the same classification. When we had service stations of our own, and had to cut to meet a price, we reduced the dealers' price correspondingly.

I wouldn't say that what I refer to as the normal service station price is really more or less of a
2354 theoretical price. It is an actual price, established
by Standard Oil Company of Indiana, at which it would like to sell its products if competition would permit it.

In view of what I say about the necessity of meeting these cut prices, and in view of what these Exhibits show of the places and instances in which we have to sell at subnormal prices, in my opinion the spot market price is not the controlling element that determines what the retail price is in the Standard of Indiana territory, or it was not in 1935 and in 1936. In my opinion the controlling element that determines what the retail price is in the Standard of Indiana territory, or it was in 1935 and 1936, is the price at which the low seller decided to sell his product. In other words, competition, and that is evidenced by these subnormal prices that I have shown you here.

It is correct to say, that because the spot market in 1935 may have gone up 1¢, that meant an increase in the realization or income of any particular company by 1¢ a gallon, only to the extent that that company was able to reflect that increase in its actual selling price.

Q. If they were selling—take the Standard of Indiana, for instance, or any other company. If they were selling at sub-normal prices to an extent that it would substantially affect its business, then

it wouldn't be correct to say that an increase of 1¢
2355 meant an increase of 1¢ in the realization to the company, would it?

A. As I have said before, only to the extent to which we were able to apply that advance to our local selling price. We would probably apply it, but it might not last more than a few days or a week, and we would have to come back to meet competition.

When you use the word "realization," I understand you to mean gross income of the company, if I understand what you mean. You mean gross revenue.

As to Standard of Indiana being the market leader and the price leader in the Standard of Indiana territory and these 10 Mid-Western states, and how that expression came to be used and what it really means, that is quite a story, but I will try to be as brief as possible.

When I went with Standard of Indiana in 1905, it was then operating as a subsidiary of Standard Oil of New Jersey. It then was distributing its products in the Mid-Western states. It was then occupying all these 10 Mid-Western states and was engaged in increasing its facilities by the establishment of new bulk plants as the development of the business necessitated. It so continued until it had distribution throughout this entire length and breadth of these 10 states.

At that time there was very little competition.
Most of the competition we had then came from Ohio,
2356 Kansas, and Pennsylvania. There were some competitors, but of the major companies involved in this proceeding, as I recall the names, there was only one, I think, that was then in existence. That was National Refining Company. If it is not involved in this case, there were none of them. I recall that National Refining Company operated out of Cleveland and had some distribution in Michigan and Indiana. Consequently, the Standard Oil Company was a pioneer in this territory. It developed it from the standpoint of the distribution of petroleum products.

When Standard Oil Company of New Jersey was dissolved in 1911, the various 32 or 33 component units were left to occupy the territory which they had previously served.

Consequently, Standard of Indiana continued to occupy these 10 Mid-Western states, and quite naturally, and maybe even because of something in the decision or in the progress of the lawsuit, this territory became known as the Standard of Indiana territory, just as Ohio became known as the Standard of Ohio, and Kentucky as the Standard of Kentucky, and Louisiana and so forth.

At that time, due to the very mild competition, which was not at all general—there were lots of places where the Standard of Indiana was exclusive—we enjoyed probably 80% of the available business. There wasn't very much gasoline business in those days. It was not an important product such as it is today. And, of course, in a great deal of that territory today, we are still the
2357 most important factor. Taking the territory as a whole today, we still enjoy a larger percentage of the available business than any other one unit, I don't care what it is.

Competition from the Group 3 area began to be felt along about 1911, when it began to be really noticeable seriously and some of these other major companies began to get into the territory and expand their facilities and go out after business. There was a very rapid development of competition. Where there had been only 1 bulk plant before, there were as many as 3, or 4, or 5 going into these one-station towns and they were usually in the same town as ours. A similar situation existed from the service station angle. And then along came the Texas Company. It wanted an outlet, and it would put up service stations, and perhaps on the opposite corner from Standard. Along came Phillips, and it wanted one, and it would get one, maybe a block away. And along came Skelly or Continental or somebody. So the outlets multiplied very fast.

Our percentage of the whole business of the territory immediately from that time on began decreasing very rapidly. In 1930, it got down to about 29.9%. In 1936, it was down to 21.2%.

That loss of our percentage of the total business decidedly was one of the reasons for the change in the method of arriving at our prices that we put into effect in
2358 September. That was one of the important arguments the sales department had, that the outmoded price structure, which had been good enough maybe 20 years before, was no longer applicable.

When I say it was down to 29.9% I don't mean the sales decreased. I mean the percentage of our total business decreased. The sales were increasing very rapidly, since 1911 until 1930. We reached the peak in 1930, and it fell off during the depression and has not yet come back to the same peak of 1930. In 1930 it was about 29.9% as much as it was in 1911. Our percentage of the total available business in 1930 was only 29.9% and that dropped in 1936. In 1911, I testified, without any competition we got up to about 75 or 80% of the entire business in the area. Gradually competition cut it down to 21.2% in 1936. I think it was 22 and a fraction % in 1935.

Because of the fact that we were pioneers and because of the additional fact that we have at all times enjoyed a larger percentage of the available business than any other single unit, and because we have always acted independently in price matters, we have come to be regarded as the market leader in the so-called Indiana territory, but this expression, "market leader," "price leader", is very much abused.

These records I have disclosed to you here today prove to me, at least, that one cannot be a market leader with
2359 a high price which your competitors don't follow. And my impression is that you can be a market leader if you make a low price which your competitors are, maybe, compelled to follow, if they are going to stay in business. But it sometimes looks today that our price structure is pretty much a mark for the other companies to shoot at today.

Twelve of the major companies in this case are in competition. They are all represented in that area. They don't all market through their own units. Many of them are represented in a considerable portion of the territory by their jobbers.

Standard of Indiana never did business through jobbers; we do our own jobbing business. We have these tank wagons covering the whole territory, as I told you, operated by our own agents and dealers. It wouldn't be very logical to have a jobber competing with us. We occasionally sell a tank car to a jobber, but we have no jobber business as the term would be generally understood except in one instance. We sell direct to dealers.

Eight out of the ten states in the Standard of Indiana territory have these one-price laws, all except Illinois and Indiana, but we get along in Illinois and Indiana just as though they had them.

Those tabulations that I made and which have been received in evidence do not contain all of the price cuts,
2360 only those that we met. There were a great many cases where I got prices on house brand products so-called that I did not meet. I customarily do not meet such competition unless it is of a major company's branded product, well advertised and generally accepted product.

I have no record of how many of those there were in 1935 and 1936. There are some exceptions, but as a rule I usually meet the third grade prices within limits. I do not always go all the way, that is, if the cut is very deep I may only go part way in meeting it.

I think it is the general understanding that when the competition which started the cut gets back to what you might call the normal price, we are required under these one-price laws to do the same thing, but as a matter of policy we believe when our competition is removed we should remove the cut price and we simply act, although that does not very often happen. When I refer to the competition being removed, I mean the cut price eliminated.

Cross-Examination by Mr. Chaffetz.

The percentage of all the gasoline sold by our company in the Indiana territory that is third grade gasoline varies according to the seasons of the year. My best recollection, and that is all I am speaking from, is that it runs about 13% to 15% over all. I would think that true generally during 1933 and 1936.

2361 I would not be in position to state what part of this regular gasoline that is sold in the Standard of Indiana territory is not a major brand of gasoline. It is not inconsequential, it is considerable, but I would not be able to give a satisfactory estimate. I would say it was as much as 10%; I think it is more than that, because there are a great many open market jobbers. There are some private brand jobbers, and jobbers who really don't work under any brand at all, who handle non-branded major products.

The subnormal prices as to which I testified are retail prices in local areas and tank wagon prices too, also in local areas. Tank wagon prices are not prices to retailers but to consumers who buy not less than 25 gallons at a time. They are sales to consumers, at any rate, just the same as to service stations.

The competition that I refer to that brings about the subnormal price in a particular local area sometimes would be a local dealer who cuts the price, or a local tank wagon distributor, or driver for a major oil company or for a jobber. That is the kind of cut price that I refer to when I talk about the cut price competition that brings about subnormal prices. I talk about any price that is lower than our established normal as being a cut price, merely in relation to our established normal.

Q. And the people who are responsible for initiating a cut price in any particular locality, however, buy their gasoline, do they not, either from 2362
major companies or on the open market? Is that right?

A. Jobbers do, yes.

Q. And when they buy on the open market they buy on the spot market; isn't that right?

A. Well, I am not familiar with the conditions under which they buy, all of them.

I have been in the oil business 32 years. I have been with Standard of Indiana all that time. I have a general idea how a jobber buys gasoline but I don't know the details of the purchases they make. A jobber who does not buy from a major buys on the spot market.

Q. So the price he has to pay for his product is determined by the spot market; isn't that right?

A. I would think that would have a relation to it, yes.

Q. If he is the one that is responsible for cutting the price, the extent to which he can cut the price must depend upon what he has to pay for his gasoline; isn't that right?

A. I would think that had considerable effect on it, yes.

Q. And if the spot market price went up that would decrease his ability to cut the price; isn't that right?

2363 A. Well, it might cause him to pause, anyway.

Q. During 1935 and 1936 was there ever a time when any major company generally throughout the Indiana territory failed to follow a retail price increase posted by the Standard of Indiana?

A. Do you mean upwards or downwards?

Q. Upwards.

A. Oh, I think I have got lots of evidence where major companies and all of them, not anyone in particular, but all of them—

Q. I said in 1935 and 1936.

A. Yes, my files are full of evidence.

Q. Generally throughout the territory?

A. Where they were selling at lower prices than our established normal.

Q. No, that is not what I asked you. I asked you whether there was any instance in 1935 or 1936 where the Standard of Indiana posted general increases in normal retail prices throughout the territory. I understand those increases were three-tenths of a cent?

A. Yes, sir.

Q. I ask you whether there was any instance where a major company announced that it would not follow that general increase by the Standard 2364 of Indiana?

A. I do not think there was any instance when they announced it.

Q. Was there any instance where they failed to announce it generally through the territory?

A. I can see this evidence in my files. I would not know whether they did it all over the 10 states in the middle west, but I know they did do it because I immediately began to receive evidence that they sold at lower prices, all proving that they sold at lower prices.

Q. Did you ever reduce the retail price generally; normal price?

A. Oh, yes.

I do not recall that after we had announced an increase of 3/10¢ we ever withdrew such an increase because the major companies refused to follow, in 1935 and 1936. Every time we made an increase of 3/10¢ it stuck partially during 1935 and 1936. It stuck as a normal price, but not as an actual.

When I talk about price competition in the local retail areas I talk about competition with persons who are selling in that particular area. It is my testimony that all persons selling in any particular area have to buy their gasoline either under contract or on the open spot market, unless they happen to be refining gasoline them-
2365 selves. And if the general level of spot market prices
went up all persons, with the exception possibly of those who are refiners themselves, all persons competing in any particular local retail area, presumably would have to pay a higher price for their gasoline, unless they had some arrangement to the contrary.

It is pretty generally known that some jobbers have a certain amount of protection against the local market.

Q. And that price follows the spot market price, does it not?

A. No, it follows the market, the selling price.

Q. The normal local market, doesn't it?

A. Well, no, I don't think that is a correct statement, because they would not require any protection if it was based on the normal price.

Q. Don't you know the normal protection provision is based on the normal retail price?

A. My answer was directed to the condition where the situation is subnormal. It is generally known in the oil business that some jobbers get protection against a subnormal market. I am not in position to testify to the extent of that.

Q. Under contract?

A. Yes, sir.

2366 I think there are contract provisions that give jobbers local protection. I am not familiar with it. I think there are quite a few.

Q. Don't you know it is the practice of companies dealing with jobbers not to give any contractual local protection? Isn't that commonly known in the business?

A. I would think the other was more commonly known.

I think it is commonly known that jobbers are given some local protection in their contracts.

Q. And you think that is general in the contracts major companies have with jobbers?

A. Whether it is in the contracts or not I cannot say, but I am positive—

Q. That is what I am asking about.

A. I am not testifying to the contract, because I am not familiar with them.

Q. You don't know?

A. I am not familiar with the exact wording of the contracts, no.

In 1935, when the tank car price went up during the spring of 1935, from March until June, the general level of retail prices, the average level of retail prices through the Indiana territory went up too. I referred to four specific increases in price of 3/10¢ each between
2367 March and the first of June.

Q. And it was generally known in the industry that it was the policy of your company to increase the level of retail prices as the tank car price went up; isn't that right?

A. Well, I don't know how the industry could have a very thorough understanding or belief on that subject, because that policy had been in effect so short a period of time.

There was some publicity in the trade journals about it. I know of no meetings where there was any publicity given to it. I know of no meetings where that policy of Standard of Indiana was discussed. I attended one stabilization meeting in Chicago, merely as an observer. I took no part in it.

The policy I testified to this morning was a secret with our company until it was in effect long enough for other people to figure out what it was. It went into effect September 11, 1934. That was more than 6 months prior to March 1, 1935.

The policy was one of fixing the normal retail price at 5½¢ above the tank car price. Up until January, 1935, the policy was to fix the price at 5½¢ above the average of the averages of the Journal of Commerce and Platt's Oilgram. And after January, 1935, we fixed the 2368 normal prices throughout the Standard of Indiana territory at 5½¢ above the average of the low of the Chicago Journal of Commerce and Platt's Oilgram.

Q. And I ask you whether it wasn't generally known in the Indiana territory, by all persons doing business, doing a gasoline business there, that the Standard of Indiana did have that type of policy, whether they knew the actual details of it or not, I am not interested in?

A. The general policy would probably be understood, but I don't know when the general publicity in the journals took place, but probably a lot of these other companies figured out what it was for themselves.

Q. Yes, and they knew that if the tank car price went up, the retail price would probably go up following it, didn't they?

A. I don't know how they would know that.

Q. Well, if they knew in a general way what your policy was, and they knew in a general way that your policy was to fix the retail price 5½¢ above the normal tank car price, then they would know that if the tank car price went up the retail price would follow it up, wouldn't they?

2369 A. The thought I have in mind, sir, is that they might figure out our price at the moment, but I don't know how they would know what we would do under some later set of circumstances.

Q. If they knew what your policy was, and if your policy was as you have described it, then they might reasonably expect that if the tank car price went up the retail price would go up, too?

A. Well, if they knew the entire policy, of course, that is a fact, but I don't know how they would know our entire policy.

Q. And if they didn't know your entire policy, but knew the substance of the policy, that would be true, too, wouldn't it?

A. Well, I am not prepared to admit that.

Mr. Lewin: Make him say yes or no.

Mr. Chaffetz: Q. I ask you again whether you didn't know that this policy that you have described here wasn't generally known about in the industry in 1935 and 1936?

A. I recall that there were some articles in the trade journals, but I do not know now, do not remember now how much in detail they went. I don't know whether they described what would happen, or what they thought would happen under a 2370 given set of circumstances. I do know that they exhibited the fact that the price was then built on the basis of the current average of the Chicago Journal of Commerce and Platt's Oilgram, plus 5½¢.

I know that was generally known in the industry. And as the time went on during 1935 and 1936, and the retail prices did change in conformity with the tank car prices, it became better known that that was the policy of Standard of Indiana. When we followed those movements two or three times, no doubt they assumed that we might always follow them.

Q. So that it was during 1935 and 1936, commonly understood in the industry that if the tank car price went up the retail price as posted by the Standard of Indiana would go up; isn't that right?

A. Well, it occurs to me that that is an assumption that I can't say yes or no on. I want to be helpful, but I don't think I am justified in admitting that assumption. I don't know what the knowledge of other people was, or how well they understood our policy.

Q. It would be a matter of interest to you, wouldn't it, to know how well known your policy was, whether it was a secret with your company, 2371 or whether it was commonly known in the industry, wouldn't it?

A. Oh, I think some times it would be helpful if they knew just what we were doing, but I don't know that they did understand that.

This policy was used during 1935 and 1936; it was experimental with us but we in fact tried it out. The first change we made was in January 1935 when we changed from the average of the averages to the average of the lows. In June 1937 we changed to the average of the lows of the two Oklahoma markets, disregarding the Chicago quotations. There was only one change during 1935 and 1936 but we did not consistently follow this policy throughout all of those years. There was an advance in the price of crude of 10¢ a barrel in January 1936 and we made a change in our price structure then, which was primarily on that advance, and without regard to the actual position of the Group 3 market at the time. It was only when the crude advance occurred in 1936 that the tank car price increased. On January 17, 1936 our normal retail prices advanced ½¢. The tank car price of gasoline had gone up between January 13th and 20th, and reached its high point on January 20th. Our retail price went up at approximately the same time, but I call attention to the fact that there was a departure from this alleged policy that everybody understood when
2372 we went up ½¢ and not 3/10¢. The tank car price
went up from about 5⅞¢ to 6⅛¢. According to the chart or graph, the original policy I spoke of called for 3/10¢ advance after the tank car market had been up that much or more for a period of 7 days. Instead of waiting 7 days, we advanced it immediately ½¢. If we had applied our policy literally we would have advanced 1/10¢ more, that is, if we had made two advances, the total would have been 6/10¢ instead of 5/10¢. If we raised our retail price exactly the same amount it was just a coincidence, because we didn't know how far the tank market was going, or whether it was going at all. I think it was just a coincidence that the company happened to raise its retail price ½¢ at the time the tank car price went up ½¢. We paid attention and watched very closely the movements of the tank car market, but when we made that ½¢ advance, we, of course, had no knowledge of how far the tank car market was going. We did know what it was on the day we made the advance, and how much it had been for 7 days prior to that advance, but we didn't know and couldn't tell whether it would go up or stay up or go back down. If it went up after we had changed our retail

price, we could have changed our retail price upwards some more and if it went down we could have reduced our retail price.

2373 Q. I don't care what your reason was for it. Your policy was to maintain your retail price 5½¢ above the tank car price, and that is what you did, isn't that right?

A. Well, it probably wasn't even exactly 5½¢ that day. It might have been 5, 4, or 5, 6—I don't know.

Q. You didn't intend to abandon your policy at the time of that crude advance?

A. No, sir.

Q. You were carrying out substantially your policy, the same as you had?

A. We were to the extent that we were still making our computation in that manner.

Q. Yes, and, that was true, then, generally throughout 1936, the same as 1935?

A. Yes, sir.

Q. That is right. All right. Coming back to these subnormal localities that you referred to, when the tank car price went up and that was followed by an increase in the level of normal retail prices, was there any change in any of these subnormal areas?

A. Yes, quite frequently in such instances, and I would say in the majority of such instances, the subnormal prices went up correspondingly.

2374 If the subnormal area was 1¢ below normal, and if the normal price went up 3/10¢, the subnormal price went up 3/10¢, too. Every time there was an increase in the tank car price, not only the normal prices went up 3/10¢ as our policy was carried out, but the subnormal prices, generally speaking, went up to the same extent. If the tank car prices were raised 1¢, and we wanted to find out how much additional revenue would come to our Company, we wouldn't ignore the subnormal prices, except to this degree: That we know from long experience that raising subnormal prices is very frequently merely a gesture, and it only lasts a little while.

Q. But where the tank car price goes up, you have already testified that that affects the ability of anybody to cut the retail price; isn't that right?

A. It should.

Q. It forms a new basis on which the competition above takes place, the competition in the retail market takes place?

A. Yes.

It is literally true that, as the tank car price moved upwards, retail prices generally, whether normal or subnormal, moved up in the same relative proportion, momentarily, anyway. That was true during 1935 and 1936 for various periods, briefly.

2375 I gave some testimony this morning about the power of our Company or any group of companies to control the price in any local retail area.

Q. I want to direct your attention to the question of the power of the same companies to control the tank car price. First, I ask you whether those aren't two separate questions?

A. Well, I am trying to recall the testimony that I gave this morning, that you are crediting me with. I am sorry; I don't just recall that particular answer that you refer to.

Q. Do you recall testifying about the ability of your Company to fix the price in any retail area?

A. Fix the normal price?

Q. And I think you said it depended on competition, what the actual price was?

A. Yes, that is right.

Q. Now, I want to take you over to the tank car market. You have now testified that the tank car market during 1935 and 1936 did exert a controlling influence upon the level of retail prices?

A. Oh, no, I didn't testify to that.

Q. I thought we just finished with that?

A. No, we didn't.

2376 Q. Didn't you just tell me that if the tank car price went up, the retail price level went up generally in the same relative proportion?

A. I said generally it went up, but I didn't say it controlled it.

Q. I said, exerted a controlling influence on it?

A. No, I didn't say it exerted a controlling influence on it, if you will pardon me—I didn't intend to say that, at least. The actual situation was that prices went up. Now, whether they stayed there or not, is evidenced by my cut price records.

Q. Now, I ask you whether, generally speaking during 1935 and 1936, the prevailing level of retail prices didn't fluctuate—I am talking about average prices now—didn't fluctuate pretty much in relation to the tank car price?

A. At the time, yes.

Q. Yes, all right. And now I want to direct your attention to the spot market price and to the factors that affected the spot market price, which in turn affected the retail price. And I ask you this question: Whether if all of the major companies doing business in the Standard of Indiana territory, combined with the independent refiners who sold gasoline in the
2377 same territory for the purpose of influencing the tank car price, whether they wouldn't have the power to influence that price upwards?

A. Any concerted buying movement involving a sufficiently substantial quantity of the product would undoubtedly have the influence of raising the tank car market.

Q. And so, in order to determine the question of the power to control the tank car price, which in turn affects the general level of retail prices, you wouldn't look to see what the competitive factors were in the particular local—in particular local communities; you would look to see what the factors were that were determining the level of the tank car prices, wouldn't you?

A. No—no, I can't admit that. As a matter of fact, from a sales standpoint, the ultimate question is, what can you get for your product at the point of sale? And in your question you injected that word "control," again.

I have told you that a concerted buying program of sufficient volume would undoubtedly influence the tank car market upward, but I didn't say it would control it, and I do not now say that the tank car market moving upwards would necessarily and ultimately over a period—it might briefly, but not for over a period—affect the
2378 retail price structure. It is a question of what you can get for it. It is a question of what your competitors in that locality are willing to sell it for, regardless of what the tank car market is. And there have been cases where there was apparently no spread at all between the local price structure and the tank car market, after deducting freight and applicable taxes, when we have had these 5¢ and 5½¢ cuts, and we were admittedly on the

theoretical 5½¢ margin, and there just wasn't any spread; so the tank car market would not absolutely control the retail price, in my judgment.

Q. That would be true particularly during a period like 1934 when there was a quantity of illegal gasoline that was being sold on the market, this so-called hot oil. Is that right?

A. I think that hot oil is a factor in the situation.

Q. You do know that in 1935 and 1936 there wasn't any hot oil in the picture?

A. Yes.

Q. In 1935 and 1936 anybody who was selling at retail, other than the refiner who manufactured his own gasoline, had to pay a price for gasoline that was based on the spot market or the level of the spot market for gasoline, isn't that right?

A. He didn't necessarily pay the spot market. 2379 It may have been a quarter or an eighth—some relation to the spot market.

Q. Some relation to the spot market, so that if the spot market went up, he had to pay more for his gasoline than previously?

A. It would just depend if he got in contact with some fellow that had some gasoline to sell and was willing to turn it into cash; even though he didn't get the spot market.

During 1935 and 1936, if I wanted to inquire into what factors entered into the operation of the spot market, which had the effect of increasing the level of retail prices, if I had any information which would lead me to believe there was a buying program in operation during that period, I might inquire—I don't know where I would inquire—but I would just get such information as was available to me. I don't know who I could inquire of about it. I had no knowledge of the buying program other than the things I may have seen in the trade journals.

The Court: Sitting in your office in Chicago, if the tank car price of gasoline in Oklahoma and Texas was going up each week, would it arouse your interest, for the reason of it?

A. Decidedly so. I would look at the trade journals to see if I could see any explanation for it.

2380 *By Mr. Chaffetz*

I don't believe I would have called in Mr. Bullock to ask him if he knew the cause of the rise; and I don't think I would have called in Mr. Seubert. Mr. Ball and I frequently discussed the tank car market, but I did not discuss the buying program during 1935 and 1936 because I was unaware of any buying program, if it existed. So that if I were asked now to tell what the factors were that determined the spot market in 1935 and 1936, I would feel qualified to discuss that only in a general way—certain economic factors at work, of course.

By the Court

Q. You did read the trade papers, didn't you?

A. I read them very closely.

Q. Were you here yesterday?

A. Yes.

Q. A witness testified yesterday about some objective, about some program—

A. I think, your Honor, I said that the only way I had, the only knowledge I had, of anything was what I read in the trade journals.

Q. You said a minute ago you didn't know anything about any program.

A. I didn't know of my own knowledge.

2381 Q. You did read about it?

A. Yes, but that didn't really impress me very much.

The Court: That is all.

By Mr. Chaffetz

As a matter of fact, anything that I may have read in the trade journals regarding this question of a buying program didn't make much impression on me, and I again remind you that during this period you have been speaking about, 1935 and 1936, I was still engaged in travelling from the Great Lakes to the Montana and Colorado borders and away from my desk 2 weeks at a stretch. I was in Minneapolis on union negotiation matters for a period of 4 or 5 weeks at one time and 3 or 4 weeks at another; that went to arbitration, which caused me to devote my time practically entirely to it to the exclusion of other matters. During that time I didn't even see the Journal of Commerce and I don't suppose I read the National Petroleum News two or three times in several months. I am not even clear that I ever read anything about it; if it was there, and I happended to read that particular issue, I probably read of it. If I did read in the paper that there was some sort of a concerted program going on, it would have been a matter of interest to me as I am interested in every angle of the oil business.

2382 Up until the close of 1935, I was assistant general manager of Standard of Indiana and during that year I was in charge of the northern division, which includes the greater part of Wisconsin, northern Michigan, Minnesota, North and South Dakota, and 8 or 9—I think 9 main stations in that area when I had it. It was my duty then to supervise all sales activities in that area and to contact the larger places to see that they were following the policies and to consult with them and advise them and inspect our properties and all that sort of thing.

Q. Did you have anything to do directly with the formulation of that policy that we have discussed in fixing the normal retail price?

A. You mean the policy adopted as of September 11, 1934?

Q. Yes.

A. I was in consultation on it. I was one of the—

Q. Were you one of the members of the committee?

A. I wasn't on the committee that actually made the recommendation, but as a member of the service department I would add my little bit to the necessity for a change.

2383 The Court: Q. Does the Standard of Indiana sell gasoline in all the ten states?

A. Oh, yes. Yes, your Honor.

The percentage of the total gasoline business in the Indiana territory done by our Company was down to 21.2% in 1936, I think that is the exact figure. That decreasing percentage did not mean a decrease in the total gallonage of our Company nor total sales of gasoline. There is an element in there. Over this period of years when the automobile industry was developing very rapidly, and the increasing consumption of gasoline was simply remarkable, we were somewhat blinded by our increasing sales, and probably didn't realize right along how much we were losing percentage of position in our business with relation to the total volume. Our decreasing percentage is no indication at all the way in which our company did grow in actual business done by it. But it is a very strong indication of a rapidly increasing competition and the effectiveness of that competition. The total business grew by leaps and bounds.

I think the total gallonage of our Company in 1935 in
50 gallon barrels—the sales department deals with 50 gal-
lon barrels, and our statistics are made up that way—the
total sales of gasoline in the 10 states were 20,985,647 bar-
rels. That would be something over a billion gallons
2384 of gasoline. That was the year 1935. The 1936 figure
is again in 50 gallon barrels, and was 23,051,513 bar-
rels. That would be about 1,150,000,000 gallons of gaso-
line.

I testified that from March until June, 1935, there were 4 increases in price in the general retail price of gasoline, and each of those increases was 3/10¢, making a total of 1.2¢ increase in normal retail prices. And I testified that the subnormal prices, generally speaking, went up in like proportion for the time being. How long they stayed is problematical.

Q. And so, to find out the amount of money that went into the treasury of your Company as a result of those 4 increases during that period you would get some indication of that, wouldn't you, if you multiplied 1.2¢ by the total amount of gasoline sold by your Company during the remainder of that year?

A. That would be an erroneous figure.

Q. It would give some indication, wouldn't it?

A. No, because the first advance didn't take place until March or April—

Q. I said during the remainder of the year.

A. You would have the difficulty of knowing the
number of barrels—finding the number of barrels
2385 that were sold during each period succeeding an ad-
vance, and you have not forgotten, I hope, that I
testified also that within the six months prior to the
time the prices had been reduced 1.9¢.

Q. I didn't ask you about that.

A. I know you didn't ask me about that, but I wanted to remind you, because I think if you want to consider the one, you should consider the other.

Q. Let us look at this for a minute. You say there was a decrease in price on September 11, 1934?

A. Yes, sir.

Q. That decrease in price substantially reduced the margin between the tank car price and the retail price, didn't it?

A. In some places, yes.

Q. In most places?

A. In order to arrive at an average, it reduced it in some places, and possibly increased it in some places a little bit.

Q. Didn't it increase it in most places?

A. Yes, I think that is a true statement.

Q. Generally speaking, just prior to September 11, 1934, the jobber in this territory who was buying his gasoline on the spot market, was making a margin in excess of 5½¢, wasn't he?

A. I think that was true.

2386 Q. Usually his margin was somewhere between 6¢ and 7¢?

A. In some places.

Mr. Donovan: We weren't permitted to go back to September, 1934.

Mr. Chaffetz: This was opened up on direct examination of this particular witness over our objection.

The Court: I think that is right.

Mr. Chaffetz: And I am going—

Mr. Donovan: May I have exception to that?

The Court: Yes.

Mr. Chaffetz: I want to make it clear, your Honor, that I am going to limit myself entirely to the particular question opened up on direct examination by this witness, not going into other factors at all.

Mr. Kirkland: There wasn't anything said about jobbers on direct. I understand this man doesn't do any business with jobbers.

Mr. Chaffetz: I am talking about the prevailing level of retail prices.

Mr. Kirkland: I submit that this question about jobbers is not cross-examination. This man doesn't have anything to do with jobbers.

2387 Mr. Chaffetz: Q. The last question that I asked you—and I think you answered it in the affirmative—was whether the usual jobber margin in this territory prior to September 11, 1934, was not between 6¢ and 7¢.

A. No, you didn't ask me the "usual" jobber margin. You asked me if there were cases where the jobber margin was as high as that.

Q. And on which, I think, you testified it was over 5½¢.

A. And in order to arrive at our average and the method I described this morning, in computing the price, we found that the general average was about 5½¢.

Q. The average between the retail price—the normal prevailing retail price and the tank car price was 5½¢ before you changed your policy?

A. The average was. And that was one reason why we selected 5½¢. We found that that would about meet the general situation.

Q. You said you reduced your normal retail price by how much?

A. By 1.6¢.

Q. 1.6¢ average?

A. Yes; yes.

2388 Q. And you brought it down to 5½¢ when you reduced it by 1.6¢ average.

A. Yes.

Q. So that the average could not have been 5½¢ when you began, could it?

A. I am talking about the average actual prices.

Q. But I am talking about the average normal price.

A. Oh, well, that is something else again. That is something else again.

Q. And I was talking about the margin between the tank car price and the normal prevailing retail price.

A. Well, that, of course, was a very variable factor, because of the method we pursued prior to September, 1934 of computing our normal price.

Q. Wasn't one of the purposes of reducing that price to reduce the margin to the jobber?

A. Not one of the purposes, no, sir.

2389 **JOHN W. FREY**, a witness for defendants, testified as follows:

Direct Examination by Mr. Donovan.

I live in Washington, D. C. I am associate director of the Petroleum Conservation Division, Department of Interior, in charge of refining and marketing. That Division is the administrative office used by the Secretary of Interior, as Administrator, in the enforcement of the Connally Act. My position is more advisory and administrative than having to do particularly with direct enforcement of the Connally Act. The Federal Tender Board in East Texas and special attorneys of the Department of Justice have more to do with the enforcement than I have.

It is part of my duty to make an analysis of markets and possible adverse effects of the Connally Act. I try to keep informed on marketing conditions. I do not directly advise the Secretary of the Interior of the operation of the Act in relation to markets. There is a director in the Division who has more immediate contact with the Secretary of the Interior. Of course, if the Secretary of the Interior should raise a question concerning such a subject, it probably would be referred to me.

2390 By education, I am a geologist, with a great deal of geographic training along that line, and I have done considerable work in economics. My particular type of training is a mineral economist, with special emphasis on petroleum. I have a bachelor of science degree from the University of Chicago, and a doctor of philosophy degree from the University of Wisconsin.

I have had experience in dealing with economic problems, particularly with those of the petroleum industry, during the past 9½ years. I have been a student of general geology, especially economic geology, and also marketing, for more than 20 years.

I taught at the University of Wisconsin from 1920 to 1928, and also at the University of Chicago. I have assisted in writing books on minerals, and I have written and edited pamphlets having to do with phases of the petroleum industry. I was responsible for the final report of the Petroleum Administrative Board.

I have held my present position with the Department of the Interior since April 1, 1936. Before that I was a member of the Petroleum Administrative Board. Before that I was chief of the Petroleum Section, Minerals Division, Bureau of Foreign and Domestic Commerce. And before that I was temporarily employed by the Bureau of Mines to make a study on the rights of Americans to 2391 explore and exploit minerals in foreign countries. I was a member of the Voluntary Committee on Petroleum Economics of the Petroleum Conservation Board. At one time I was chairman of that Committee.

The Petroleum Conservation Board was originally appointed by President Coolidge, consisting of the Secretaries of Commerce, Navy, War, and Interior. They were studying and doing what they could, informally, to preserve the American petroleum reserves.

September 11, 1933 was the date when I became a member of the Petroleum Administrative Board. When the Board was organized, Mr. Margold, solicitor of the Department, was chairman; Mr. Fahy was vice-chairman; Mr. Myers and Mr. Marshall were members; Mr. Swanson was a member in charge of the Production and Refining Division. I was the member in charge of the Marketing Division. For a brief period we had a special technical adviser by the name of Thomas.

The functions of the Petroleum Administrative Board with respect to marketing were to carry out the purposes of Article V of the Code of Fair Competition for the Petroleum Industry. Those purposes briefly were essentially to do away with many of the abuses that had developed in marketing, and to create conditions which would make it possible for the marketing branch of
2392 the oil industry to operate at a profit, so that it would be possible for that branch to pay living wages to those employed.

The Board was normally not conducted as a solid group; it was rather departmentalized. We had a group of men who were in law; Mr. Marshall, Mr. Myers, Mr. Fahy, and Mr. Margold were lawyers; Mr. Swanson gave his attention to production and refining; and I gave mine to marketing. We rarely met as a Board. We usually reported what was happening in our particular field to the chairman of the Board. If he felt it was necessary for all of us to get together, he called a meeting; but normally we operated independently, each more or less in his own division. Insofar as I could solve any problems that had to do with marketing, I did that myself. If necessary, I called in help.

Q. Now, in connection with your work as chief of the Marketing Division of the Petroleum Administrative Board, did you deal on behalf of the Board with the stabilization activities, carried on by Mr. Arnott and committees appointed by him under the authority of a letter of the Secretary of the Interior to Charles E. Arnott, dated July 20, 1934?

Mr. Chaffetz: That is objected to.

2393 A. I did.

Mr. Chaffetz: That is objected to, and I ask that the answer be stricken. It is objected to as incompetent, irrelevant, and immaterial, and having no bearing on the issues in this case.

Mr. Donovan: Your Honor, I hope to establish that it is—

Mr. Crawford: If the Court please, this can have no relevancy at all unless it is followed up by the use of the letter to which he refers, which has been excluded from evidence on three definite and particular times after days and days of argument. The question is objectionable for that reason alone.

Mr. Lewin: That is the retail letter, your Honor.

The Court: Objection sustained. I think if this witness tells what he did at that time, if it is material—objection sustained. Exception allowed.

Mr. Donovan: Q. Well, will you tell us what you did in connection with the activities carried on by Mr. Charles E. Arnott and committees appointed by him, dealing with the tank car stabilization work?

2394 A. Your Honor, there is a confusion here on that, because the first committee was the Stabilization Committee, and the Tank Car Stabilization Committee was more like an off-shoot of it, and I think it is a question of sequence that makes it very difficult for me to answer.

Mr. Chaffetz: The question is with relation to the Tank Car Stabilization Committee.

The Court: Yes, you can answer that question—

Mr. Lewin: So-called.

The Court: (Continuing)—no matter whether it is difficult or not.

A. All right. So far as direct participation of sitting in at all meetings and knowing everything that happened in connection with the Tank Car Stabilization Committee, I can't testify that I did. But I was acquainted with the work that Mr. Arnott was doing in connection with general stabilization and I also was acquainted with the objectives of the Tank Car Stabilization Committee.

Mr. Donovan: Q. Now, do you know what the objectives of the Tank Car Stabilization Committee were?

2395 Mr. Chaffetz: That is objected to. He wasn't a member of that Committee. I don't see how he could know.

Mr. Donovan: He said he was acquainted with the objectives, your Honor.

Mr. Chaffetz: Find out how he was acquainted.

Mr. Lewin: Certainly he had no official connection with it whatever.

The Court: Q. Just what contact did you have with that Committee, that you have described now as a Tank Car Stabilization Committee?

A. Mr. Arnott was General Stabilizer. He reported to us—

Mr. Donovan: When you say to "us" whom do you mean?

A. The Petroleum Administrative Board.

Mr. Crawford: He gives Mr. Arnott a brand new title here, so far as I know, and he hasn't any right to do it. Where does he get it?

Mr. Donovan: Will you let him cross examine the witness, your Honor? I am examining the witness now.

Mr. Lewin: What possible relevancy can it have, that Mr. Arnott had a talk with him and reported to him, when he had no authority whatever
2396 to get such reports?

Mr. Donovan: Now, your Honor—

The Court: Just a moment. I have asked him what contact he had with the work of that Committee.

The Witness: The answer is, sir, no direct connection.

The Court: You don't have to describe Mr. Arnott in any way. You say, no direct connection.

A. That is right.

Mr. Donovan: Q. Did Mr. Arnott report to you?

A. Yes.

Q. Did he report to you in 1935?

A. He reported to me in 1935, in March; I think the date was the 12th.

Q. Who were present at that time, when he reported to you?

The Court: Q. Did he report in writing, or orally?

A. Orally.

Q. Where?

A. In Washington, at our office.

By Mr. Donovan

Our office was at 1729 New York Avenue, Washington. This was the Petroleum Administrative Board office 2397 of the Department of the Interior. When Mr. Arnott reported to me there were present Mr. Fahy, at that time chairman of the Board, Mr. Swanson, a member of the Board, I think Mr. O'Shaughnessy, one of the legal advisers of the Petroleum Administrative Board, Mr. Collender, Mr. Furlow, Mr. Majewski, Mr. Jackson—

Mr. Chaffetz: Q. Is that Mr. Allan Jackson?

A. Mr. Allan Jackson; Mr. Carnes—

Mr. Lewin: Q. Is that Mr. Bernard L. Majewski?

A. That is right.

Mr. Donovan: Q. Is that meeting of March 12th that we are talking about now? You have said that he saw you on March [illegible]th, Mr. Arnott saw you then?

A. Yes.

Q. Now, were these other gentlemen present on March 12th, or isn't that confused with another meeting?

A. Let me see—yes, that—I will have to strike that out, back—let's see—Mr. Arnott was there, that is sure. And the gentlemen of the Board that I referred to were there. Mr. Allan Jackson and Mr. Carnes were not there. I can't remember now whether Mr. Majewski was or not.

2398 Q. Well, what was discussed at this meeting?

Mr. Crawford: Object to that as incompetent, irrelevant, and immaterial. We are getting right now into conversations between this witness and another group of people, and there isn't any conceivable ground upon which they can have any bearing at all upon this controversy, unless it is that there is going to be some admission or declaration here, testified to by this witness, supporting the Government's case, and we don't expect that.

Mr. Donovan: Your Honor, I only wish to point this out in answer to the objection made by counsel for the Government: This gentleman here was a member of the Petroleum Administrative Board. He said that he had to make an analysis of the activities of the work of the Stabilization Committee, conducted by Mr. Arnott. He said that he was familiar with the Tank Car Stabilization work.

He said that Mr. Arnott reported to him on this day. I think we are entitled to know what Mr. Arnott reported.

Mr. Chaffetz: Unless, your Honor, they can show that this witness had authority to grant approval of a buying program, I don't think that anything
2399 that was said between him and anybody else is of any significance, unless they intend to show that that led up to the kind of approval that would be required. I don't understand they can or are going to attempt to make that proof, and therefore I think this testimony is all immaterial.

Mr. Donovan: Your Honor, I have said repeatedly that we are not here for the violation of the Code. I have said repeatedly that our contention is, under our theory of the case, that what we did was right and proper. I have urged, too, upon your Honor, that we are entitled to show all the facts and circumstances bearing upon what was done by these men during that period. And this has relation to the charge in this indictment—

Mr. Crawford: The Court has made a very definite limitation of how far they can go in that regard. And counsel has said something about what they are claiming here. They mustn't overlook what is being claimed by the Government here, that there was a conspiracy, a gigantic one, in which all the major oil companies referred to. And this class of testimony to which counsel now
2400 refers, I submit, it would have no possible bearing upon that question. And that is the question here, did they or did they not engage in the conspiracy alleged in the indictment?

Mr. Donovan: Let us take the words of Mr. Crawford himself, your Honor, improper though they may be before this jury.

He says we are charged with a gigantic conspiracy. We are therefore charged with something unlawful. We are entitled to show that what we did was lawful; that it was not furtive, that it was in the open; that here was a representative of the Government, to whom Mr. Arnott went to report the activities of this Tank Car Stabilization Committee. If that isn't relevant and material, I don't know what is.

Mr. Lewin: The witness can't possibly give approval to this thing.

Mr. Chaffetz: As a matter of fact, they ought to show that this witness had some official connection, if they can, with the buying program, and I don't believe he did. And if they can't show that, then all this material is clearly irrelevant and immaterial.

Mr. Lewin: Your Honor, are they to be permitted to go into that office and, because a man appears 2401 to hold a job in Washington, they can show conversations between any one of these conspirators and that man working in Washington? That is just as relevant as this is. This man had no more authority to approve these buying programs than I had, and I had none. We are right back to that question.

The Court: I will ask him that question:

Q. Did you have any authority to approve any buying pool?

A. The Secretary of the Interior was the only—

Q. Did you have, I am asking you?

A. No, I didn't.

The Court: Well—

Mr. Donovan: Now, your Honor, in view of your Honor's question there, I desire to show just what this gentleman did, who was on the Petroleum Administrative Board, the adviser to Mr. Ickes; what he did in relation to Mr. Arnott, particularly bearing upon the question of furtiveness and secrecy, as showing what was revealed to the Government at the time; and what if anything, what if anything this gentleman or other members of the Board or those connected with the administration of the oil industry 2402 did with Mr. Arnott. Now, it seems to me we are entitled to show that, if we can.

Mr. Chaffetz: On that question, your Honor, it is perfectly obvious that they didn't reveal to this gentleman or to anybody the things they now deny they were doing—

Mr. Donovan: I object to that statement.

Mr. Chaffetz: Just a minute. You didn't hear me out—

Mr. Donovan: If it please the Court, I ask—I must ask, your Honor, that the Court instruct the jury to disregard such a statement by counsel as highly improper.

Mr. Chaffetz: You didn't even hear me out.

Mr. Donovan: I heard enough.

The Court: Just a minute, gentlemen.

Mr. Donovan: I ask for that ruling.

Mr. Chaffetz: No, he can't have any objection to what I said, your Honor.

Mr. Donovan: I ask for a ruling by your Honor.

Mr. Chaffetz: All I said was this: That it is obvious that he didn't tell this gentleman that they were doing things which they now deny that they were doing—

2403 Mr. Donovan: That isn't what he said, and I ask for a ruling.

Mr. Chaffetz: I ask the Reporter to read what I said.

The Court: Just a moment—

Mr. Chaffetz: I ask the Reporter to read what I said previously.

The Court: Go ahead, read the statement.

(Statement of Mr. Chaffetz read by the Reporter, as follows:)

> "On that question, your Honor, it is perfectly obvious that they didn't reveal to this gentleman or to anybody the things they now deny they were doing."

Mr. Chaffetz: That is all I said.

Mr. Donovan: I still ask for that, your Honor, that the jury be instructed to disregard that statement.

Mr. Chaffetz: Now, I say this—

Mr. Lewin: Why not concede it? I wouldn't mind.

Mr. Chaffetz: Now, I say this: That being so, we still come back to the question of what they were doing, which is the question in this case, the facts of what they were doing. We claim they were doing one thing; they claim they were doing something else. 2404 And what they told somebody they were doing in 1935 doesn't help us at all to the decision of what they did do.

Mr. Donovan: Your Honor, if we don't—the question is this, what did we tell Dr. Frey?

Mr. Lewin: What difference does it make?

Mr. Donovan: Now, we ought to be given the opportunity of showing what we did tell him. We have heard testimony here of Mr. McDowell—

The Court: Q. Well, you had this talk with Mr. Arnott, where was it had?

A. In our office.

Q. And by that, you mean the Petroleum Administrative Board's office?

A. Yes, sir.

Q. And what members of the Board were present, Mr. Fahy?

A. Mr. Fahy, Mr. Swanson, and then we had assistants, but we were the only members, the three of us.

Q. And was any record made of his report to you for that Board?

A. There was a memorandum—no, there wasn't.

Q. When was that report made?

Mr. Lewin: He said there wasn't any, your Honor.

2405 The Witness: I say there wasn't any.

The Court: Q. No. I say, what was the date of that report he made to you; was it in March, 1935?

A. That is right, March 12th.

Q. And there was no record made of any kind?

A. No.

Mr. Lewin: Unofficial.

The Court: Q. Was there a minute book or record kept of the meetings of this board?

A. No, sir.

Q. There wasn't?

A. No, sir.

Mr. Chaffetz: If your Honor please—

Mr. Donovan: I wish—

Mr. Chaffetz: If you were asking that, I would just as soon that you would ask the witness whether this report that was made was an official report; and secondly, whether it was made in connection with asking for approval of what was being done.

Mr. Donovan: Now, your Honor—

Mr. Chaffetz: Those are the things that are pertinent.

Mr. Donovan: Now, your Honor, I think I should be permitted to conduct my examination—

The Court: Well, I just want to find out just
what authority this man had, and what this Board
2406 did. They kept no records of any kind, or minutes
of their meetings?

A. No, sir, we never kept minutes.

Mr. Donovan: I think it might aid, your Honor, if I were to ask him just how the work of the P. A. B. Board was conducted. I do ask him that question.

Mr. Lewin: Your Honor, would you ask him whether or not this was an official report, or whether this wasn't simply an unofficial conversation.

Mr. Donovan: I object to such a question, your Honor. Let us get the facts—

Mr. Lewin: I want the facts.

Mr. Donovan: Let us get the facts.

By Mr. Donovan

Our contact was very informal with the industry in carrying on the work of the P. A. B. We had frequent occasion to arrange various things with them, controversies of one type or another would develop, and in just a few minutes we might rush into a particular situation. The period was extremely hectic. We didn't have time to sit down and assemble the Board formally to deal with every detail. Every fellow was out to do as much as he could to restore the industry to normal.

2407 Sometimes it was necessary to meet with members of the P. & C. Committee in Washington, in Chicago, in Detroit, in New York, wherever it happened to be convenient. All of us were at these meetings in very few instances.

We were sort of a buffer between the committee of the industry, that is, the Planning and Coordination Committee, and the Administrator of the Code, the Secretary of the Interior. Very frequently all preliminary negotiations were carried out in that informal way; and in some instances they were formalized by an order of the Secretary; in other instances, they were not.

The Court: Q. Did you make a detailed report to Secretary Ickes of the report Mr. Arnott made to you and your Board?

A. I rarely reported directly to Mr. Ickes—

Q. Well, I am asking you if you did make a report to Mr. Ickes?

A. Personally—no, I did not.

By Mr. Donovan

The chairman of the Board, Mr. Fahy, was there. I do not know whether he made a report to Mr. Ickes or not. It was the duty of the Chairman of the Board to report to the Secretary of the Interior.

Q. Now, will you tell us what took place—

2408 Mr. Chaffetz: Just a minute.

Mr. Lewin: Your Honor, will you ask him whether he doesn't know that there was no such report ever in existence, not only then, but at all times before and after?

Mr. Donovan: I object to that question at this time, your Honor. He can ask that on cross-examination.

The Court: Q. There is nothing in writing now with reference to any report of Mr. Arnott to you and your Board now, is there, that you made at or about the time the report was made?

A. No, I can't recall that there was, that there is any memorandum to the Secretary exactly coincident with the act. Is that—

Q. Do you know how long the price war was in existence that Mr. Arnott was dealing with?

A. Oh, months and months. If—

Q. When did it start, and when did it end?

A. Well, to begin with, we came into the Code period with tremendous price disturbances, and fought them all through 1933 and 1934. We were just beginning to get things—

Q. I am talking now about the price war that was on after November 30, was it?

Mr. Chaffetz: July 20, 1934, your Honor.

2409 The Court: Q. July 20, 1934, from that time on?

Q. After July 20, 1934, and on July 20, 1934, there was a price war on?

A. Yes.

Q. Now, what do you mean by a price war?

A. I mean a condition in which there is general price demoralization, where there is a large amount of selling below normal prices, and where the competition is so bitter, that, in cases, it may lead to selling below cost.

Q. You mean where the service stations are, one is selling lower than the other, and they are trying to meet that competition?

A. Yes, sir.

Q. And that is where the price war existed, among the service station men, and the jobbers?

A. Yes, sir. Of course, the tank car price was very subnormal, too; that is an incident—

Q. Well, I am talking now about the price war that Mr. Ickes was telling him to stabilize.

A. Yes.

Q. The price war existed between the service station men and owners?

A. Between service stations, between jobbers, between integrated companies, between refiners—everything was in turmoil.

2410 Q. Well, what did you understand to be the price war that was raging in July, 1934, and continued, and reached its peak in October, and practically ended in December? Now do you know anything about that price war?

A. Yes, sir.

Q. What was it?

A. Do you mean what was happening during that period? That price war was very extensive all through the Middle West, and I was in that; in the position that I occupied I was trying right along to see what could be done to get the prices normalized.

Q. The prices at the service stations?

A. At the service stations, and between jobbers, and between track-side operators. Everyone that was engaged in marketing in any way seemed to be in that embroilment; and it was part of my job to see if I couldn't iron out that difficulty.

Q. What did you do during that time?

A. I worked very closely with Mr. Arnott as the Chief Stabilizer of the Stabilization Committee, to iron out these difficulties between various contending forces. We held meetings in quite a number of places in the Middle West, trying to get the companies to determine what was wrong and what could 2411 be done to get prices back to normal.

Mr. Chaffetz: Q. That is, retail prices?

A. All prices.

By Mr. Donovan

When I say all prices, I mean the general price structure. I mean retail prices, jobber prices, tank wagon prices, tank car, right back to the refinery.

The Court: Q. What was done to eliminate the price war between July, 1934, and January 1, 1935?

A. Well, many, many meetings were held to get —to overcome the abuses that were partly responsible—

Q. What were those abuses? Well, let's just start out; you first felt the effects of this price war among the service stations, did you, one was underselling the other?

A. Yes.

Q. Now, what did you do to eliminate that?

A. We went into that—at first, we went in and tried to hold local meetings.

Mr. Donovan: Q. When you say "we" whom do you mean?

A. The Petroleum Administrative Board, acting with Mr. Arnott's Stabilization Committee. Now, 2412 this is the period late in 1934. And we very soon found that it was impractical to try to solve the problem just locally, where we would get a group of dealers or jobbers to agree that they would eliminate underselling, under-price posting, chiseling of one variety or another. And gradually our activities expanded. The first—

The Court: Q. Did you have any success at all dealing locally with the service station owners?

A. It was very unsatisfactory.

Q. What was the next step?

A. The next step was to take a larger area. For instance, the first large area that we dealt with was, as I recall, Michigan, in which we tried to handle the entire state. Our efforts in Michigan were not entirely successful either. Then we tried to handle a very much larger area, such as the Standard of Indiana territory, but it was a gradual movement outward from a very local situation to a state, to several states, to a large territory. In some of those meetings we discussed conditions all the way from the Rocky Mountains to the Ohio line.

Q. You discussed conditions, but what did you do to cure that trouble?

2413 A. We got companies to enter into agreements with each other to—in some instances we even got a company to volunteer for a period to raise the general price level to see whether it would stick, as an example.

Mr. Donovan: Q. When was that, Doctor?

A. Well, we tried that experiment in a small way as early as the beginning of 1934. I tried that personally all through the summer of 1934, and then in connection with the stabilization committees through the fall and winter of 1934 and into 1935.

Q. Do I understand—

The Court: What was the result of that?

A. That work was more successful.

Q. What did you do after that?

A. Co-incident with that this buying started, and we had also—

Q. What do you mean by the buying started?

A. Buying by the major companies of distress gasoline from independent refiners.

Q. When did that start?

A. Oh, there were several periods of that, but—

Q. When did it start?

A. February.

2414 Q. Of 1935?

A. Of 1934—no, 1935.

Q. 1935. Now, up to that time, up to February 1, 1935, what was the condition of the price wars? Had they been pretty well eliminated then?

A. Sometimes they were. We would get a period in which there was a decided benefit from our activities, but usually they would slide back after a relatively short time.

Q. What percent of the price wars were wiped out in January, 1935, would you say?

A. Oh, a very high percentage in this territory had been wiped out by January, 1935.

Q. By "this territory" you mean—

A. Indiana territory.

Q. In 1935?

A. Yes.

Q. So there was very little of it existing after January 1, 1935?

A. The condition was very much better after January, 1935.

Mr. Donovan: Q. Were there any price wars during that period, January, 1935?

A. Yes, yes. I never have seen the market when it did not have a price war at some place or another.

2415 The Court: Well, you kept in pretty close touch with what was going on? You worked with this stabilization during the price wars?

A. Yes, sir.

Q. And worked with it up until December, 1934?

A. Yes, sir.

Q. And you continued the work after that?

A. Yes, sir.

Q. January, 1935, and February?

A. Yes, sir, we worked with them right up to the end of the Code. That was May 25th or 27th.

Mr. Chaffetz: Colonel.

Mr. Donovan: No, I want to finish with this witness.

Mr. Chaffetz: Well, I want to—

Mr. Donovan: Now, your Honor, I should think I would be permitted to have this question answered.

The Court: That is what I am trying to find out.

Mr. Donovan: Yes, I know your Honor is, and I am not going up to the bench at this time.

(Mr. Chaffetz went to the bench and conferred with the Court.)

Mr. Donovan: Now, your Honor, I want to enter this objection at this time to counsel for the Govern-
2416 ment interrupting the examination of the witness in the manner he is doing at this moment.

The Court: Overruled. Exception allowed.

Mr. Crawford: Let the record show just what he is referring to.

Mr. Donovan: I think, your Honor, that I am entitled to an uninterrupted examination of this witness.

The Court: Counsel is referring to a letter written by the witness to somebody.

Mr. Chaffetz. Another member of his staff.

Mr. Donovan: I object to that action by counsel for the government in view of the question that is now addressed to the witness.

The Court: Overruled; exceptional allowed.

Mr. Chaffetz: I have an objection pending to all this line of testimony.

The Court: You have, and I am trying to find out whether it is material or not.

Mr. Chaffetz: The objection is this, your Honor; that there is no showing that this witness had any authority to approve anything that was done along the lines involved in this case. Your Honor has seen the letter which was Mr. Arnott's authority, and you construed that; it shows the scope of his authority under that letter.

2417 There is no showing here that the head of the Department, Mr. Ickes, knew about this or authorized it or acquiesced in it in any way.

There is no showing as to why they call this man instead of calling the chairman of the Board. There is some evidence here that the chairman of the Board may have had authority to report to the Secretary of the Interior. The chairman of the Board has not been called as a witness.

We think nothing can be gained in testimony along this line in the way of supporting the defendants' case, and we ask that the entire line of questioning be stricken out.

Mr. Francis: Now, we think there can be something gained in support of defendants' case, by showing that there was an administrative approval of the things which we did, and that will certainly be beneficial to our case.

Mr. Chaffetz: I wish you would ask the witness whether he had the authority to approve, or whether he did approve, or whether he—

The Court: (To the witness) Answer that question. Did you have authority to approve any action of Mr. Arnott or anyone else?

Mr. Chaffetz: With respect to buying programs.

2418 The Court: With respect to buying programs. Answer that.

A. We could not formalize any buying programs.

Q. Did you have any authority or any power to approve any action of Mr. Arnott or anyone else in the buying programs?

Mr. Francis: I said administrative approval.

The Court: I am asking him.

A. Well, I think we did approve many things. Now, whether we had the authority to approve I am not sure, but we did approve.

Mr. Crawford: But that is not the question.

Mr. Donovan: Your Honor—

The Court: Q. You know what authority you had, don't you?

A. Well, even the question of authority was indefinite. We had no written instructions from the Secretary of the Interior as to just how far that authority runs and no further.

Mr. Chaffetz: I would suggest to your Honor you ask him whether he was asked for approval of any of those things.

Mr. Donovan: Now, may it please the court, can't I proceed in a proper manner with my examination?

2419 The Court: Yes, but I want to find out about this.

Mr. Donovan: I have no objection to the questions, but I wish to proceed with my examination.

The Court: I will ask the question:

Q. Did Mr. Arnott ask for approval to conduct a buying program?

A. No.

Mr. Donovan: Now, I would like to ask just what the conference was, your Honor, and what was said.

Mr. Chaffetz: I think, your Honor, the last question you asked is conclusive; they did not ask for approval. There are some legal questions involved. Your Honor has read Article 6 of Section 4 of the

Refinery Amendment of the Code, and that section of the Code describes exactly the thing that the defendants were doing. It says arrangement may be made for the purchase of gasoline from refiners and for the orderly resale thereof by and with the approval of the President.

The Court: Let me ask the witness:

Q. Did you ever hear that section he has referred to?

A. Yes, sir.

2420 Q. Did you know it was in existence at the time you were on this Board?

A. Yes, sir,

Mr. Chaffetz: I think in view of the fact that no approval was asked of this witness, not asking for the approval of the President or the Secretary of the Interior, that we certainly ought not to go any further with this.

Mr. Donovan: Now, in view of those questions which counsel for the Government has asked, I submit we are entitled to hear the entire conversation that took place there. We cannot have go before this jury a question that amounts to a conclusion, when they are the ones that must pass on that very question. Now, I am entitled to know, and these defendants are entitled to know, what was said at that meeting, particularly since it now appears in response to your Honor's question that this gentleman was cooperating with Mr. Arnott's committee in stabilization work throughout this whole territory, that he was in constant contact with him, that he knew the condition that was going on, and that Mr. Arnott would make a report to him—what did Mr. Arnott say? What did Dr. Frey say? What occurred there? What happened subsequently? Those things we are entitled to know.

2421 The Court: Dr. Frey had no power to bind the United States.

Mr. Donovan: Your Honor, to listen to such a technical argument by counsel for the Government—

Mr. Lewin: It is not technical.

The Court: Nevertheless I think it is irrelevant and immaterial, but I will let him state what report Mr. Arnott made. I think it is entirely irrelevant and immaterial.

Mr. Crawford: Now, if the court please—

Mr. Donovan: Now, I must ask for an exception to your Honor's statement that this is irrelevant.

The Court: Then it is sustained because I don't think it is material. Exception allowed.

By Mr. Donovan

(Document submitted by Mr. Donovan marked Exhibit 914 for identification.)

It is stated on the face of Exhibit 914, "The Final Report of the Marketing Division, Petroleum Administrative Board." It was prepared in my division under my direction following the close of the Code period. My division was under the Department of the Interior, of which Secretary Ickes was the head. Page 120 of that report under the head, "Stabilization," was prepared under my supervision, and at my direction. That Final Report is a 2422 publication of the Department of the Interior, and was submitted to the Secretary of the Interior. It refers to the Code period and subsequent to the Code up to the end of October, 1935.

Mr. Lewin: And written in 1936?

A. The writing was started immediately after the reports came in. The bulk of the writing was done in December, January, February of 1936.

Mr. Donovan: Now, your Honor, I offer in evidence this Final Report, 914, and particularly that portion of it running from page 120 to 126, both inclusive, headed: "Stabilization."

(Passing exhibit to the Court.)

Mr. Chaffetz: If the Court please, the Government objects to the introduction of that document on the ground that it is an ex parte report, is not evidence in any event. The statement is not evidence of the facts.

Second reason, that it was written a year after the expiration of the Code, and doesn't purport to be any sanction by the Secretary of the Interior of anything that was done during the Code period. It is an historical statement a year later of some things that had taken place, without any indication at all of whether they had been approved at the time they were being carried on.

2423 I think the report is—

The Court: Who is this report by? By the Secretary of the Interior?

Mr. Chaffetz: No. It was written by this man (indicating the witness). He is head of his branch—marketing division. It was written, as he said, in June—published in June, 1936, and can't be any evidence of any official sanction of what was being done at the time the Code was in operation in the spring of 1935.

The Court: I want to give some consideration to this. I started to read part of it, but I haven't yet finished it.

Mr. Chaffetz: All right.

The Court: But I want to give a little more attention to this other question, about this report that Mr. Arnott is supposed to have made to you (addressing the witness) in March, 1935. You did not communicate that report to Secretary Ickes?

A. I did not.

Q. You kept no record of it?

A. No, sir, we kept no record of it.

Q. Do you think you would remember now what he said to you?

A. Yes, sir.

2424 The Court: (Addressing counsel) On this question of whether or not everything was done secretively, it may be admissible.

Mr. Chaffetz: I don't think it matters a great deal whether it was done secretively or not. The question is whether they did the things that were changed in the indictment, and, as I said to your Honor before, obviously any statement that was made at that time would be a self-serving statement by one of the defendants and would be stated in the light in which he would want to state it.

The Court: You wouldn't expect it to be self-serving if he was making it to a man on the Petroleum Administrative Board?

Mr. Chaffetz: That is when we would expect it to be self-serving. He would state it in the light in which he wanted to state it; therefore—

Mr. Donovan: I object. That is a statement—

The Court: We won't have any more argument about it. You may answer that.

A. What is that?

The Court: He made a report in March, 1935?

Mr. Donovan: March 12, 1935.

By the Court

Mr. Arnott told the members of the Petroleum Administrative Board present that arrangements had been

2425 made by which quite a large number of major companies would buy distress gasoline from independent refiners.

He also stated that there was no pool made for such purchases, that the buying was strictly informal, that no refiner was committed to a definite quantity of gasoline which he would have to buy, and that the hope was that by such informal buying the price of gasoline at the refinery could be improved so that the lack of parity which had existed between the crude oil and the tank car market could be eliminated. In other words, they would have a stabilized market as between the crude price, the tank car price, and the wholesale and retail price.

Mr. Donovan: Q. What did you say to him when he made that report, Doctor?

Mr. Crawford: Same objection.

The Court: He may answer that.

Mr. Chaffetz: I wonder whether the witness purports to have said anything Mr. Arnott said to him.

The Court: Q. Have you told us all? If not, do so.

A. All that I can recall now.

Q. You haven't missed anything at all?

A. Nothing at all.

Q. You have thought about this a great deal before you came on the witness stand, have you?

2426 A. Well, we have talked it over with Government attorneys for a year and a half now and—

Q. Have you talked it over with the defendants' attorneys?

A. No, sir.

Q. You mean to say you haven't talked with any of the defendants' attorneys before you got there on this witness stand?

A. Yes, sir.

Mr. Donovan: Your Honor, we are absolutely prevented from talking with him except in the presence of Government counsel. I want to show this to your Honor (producing paper). And here is a letter which I think in view of the statement I should read to the Court.

(Document passed by Mr. Donovan to the Court.)

The Court: What I had in mind was that the attorney talked to the witness before he put him on the stand.

Mr. Thomas: The Government isn't the only one.

Mr. Chaffetz: Since that was said: With every counsel's witness who got up on the stand except Judge Denton's, there was a lawyer present.

2427 Mr. Donovan: I object to that statement before the jury, and ask that the jury be instructed to disregard it.

Mr. Chaffetz: Now the attempt was made by Mr. Thomas to say that the Government was the only one who followed that, that counsel be present when opposing counsel talked to the witness. I say I talked to 6 or 7 or 8 witnesses, and with every one there was a lawyer present except Judge Denton's.

Mr. Donovan: It is an entirely different position, your Honor, with counsel for the Government.

The Court: We are getting way off. I want to say to the jury that counsel has a perfect right to talk to his witness before he goes on the witness stand, and we expect every counsel to do so, and it may be that counsel for the defense have talked with other witnesses, did so in the presence of counsel, opposing counsel, which was perfectly all right, also, but—(addressing the witness) well, it is a fact you did not talk to defense counsel before you went on the witness stand?

A. That is true.

2428 Mr. Crawford: I think in that connection he ought to be asked whether he ever told Government counsel this story that he is telling here.

Mr. Donovan: Now, I think again that is an improper question.

The Court: You may go into that on cross-examination, Mr. Crawford.

Q. Now, have you told us all?

A. Yes, sir.

Q. On that report?

A. Yes, sir.

Q. Nothing that you—

A. Nothing that I know of—I am not holding back anything. If there is anything more, it has slipped my mind.

Q. Now, have you told us all—everything you said to Mr. Arnott?

Mr. Donovan: He hasn't told that, your Honor.

A. I didn't reply to that question, but the—I made no particular reply. It wasn't necessary for me to. Mr. Fahy was content in making—

The Court: Q. Were you familiar with Section 6 of Article 4 that we have been discussing here at that time?

A. Yes, sir.

2429 Q. Did you call his attention to that?

A. No.

Mr. Donovan: Your Honor, I must—I am sorry, but I must object to the last question of your Honor to the witness.

The Court: You may have your objection and exception; objection overruled.

By Mr. Donovan

At that meeting, Mr. Fahy asked Mr. Arnott whether there was any question about their violating the Sherman Anti-Trust, whether their purchases would be in violation of the Anti-Trust law. Mr. Arnott replied that he didn't think that they were in violation of the Anti-Trust laws.

Q. Was Mr. Arnott told to discontinue this work or told to go on with it or anything said about that?

Mr. Crawford: I object; incompetent, irrelevant and immaterial. We now get to this acquiescence.

The Court: Objection sustained. Exception allowed. We have had the report. That is as far as I think we ought to go.

Mr. Donovan: Your Honor, may I not ask any particular thing that was said at the conference?

The Court: The witness told us now that he has told us all the report he can remember.

2430 Mr. Donovan: I would like to ask him further on that, but in view of your Honor's ruling—

The Court: I think that is as far as we ought to go.

Mr. Donovan: May I ask him if he has told us all that Mr. Fahy said?

The Court: Mr. Fahy? I think we ought to leave that alone. Exception allowed.

Mr. Donovan: I understand your Honor's ruling bars any line of questions that I might ask pertaining to what was further said in this conference?

The Court: He has told us about the report Mr. Arnott made and what he said to Mr. Arnott, and that is as far as I want to go. Exception allowed.

Mr. Donovan: And as to any further questions regarding that, your Honor would sustain the objection?

The Court: Yes.

Mr. Donovan: I want an exception to that.

I knew about a month or a month and a half before March 12 about the Tank Car Committee. I knew that a Tank Car Committee had been talked about and was under the impression it had been appointed, but I didn't know definitely until Mr. Arnott reported.

2431 Q. In May, 1935, did you become aware of the condition of the independent refiners in Western Pennsylvania?

Mr. Crawford: I object to that. Wholly immaterial to anything involved here.

Mr. Donovan: It may not be, your Honor. Just move one step at a time here.

Mr. Crawford: Pennsylvania!

Mr. Chaffetz: I think it is clearly immaterial and irrelevant.

The Court: Yes. Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, may I ask a few questions without violating your Honor's ruling and consider the objection made on them and the objection sustained?

The Court: Go ahead.

Mr. Donovan: I would like to ask the witness:

Q. You must not answer these questions—

Mr. Chaffetz: Well, I object to that procedure. That is improper.

Mr. Donovan: How can I make my offer of proof unless I have the questions present here?

Mr. Chaffetz: He can make his offer of proof at the proper time.

2432 Mr. Lewin: In former cases he has made his offer of proof in question and answer form.

Mr. Donovan: But I am not permitted to talk to this witness.

Mr. Lewin: That is unfair—

The Court: You have a perfect right to talk to the witness whenever you want to.

Mr. Donovan: I am glad of that, your Honor. In view of that, we will prepare an offer of proof and submit it for this witness.

The Court: Q. The orders you got not to discuss this case with defendants' counsel were not from the attorneys?

A. No.

Q. It was from somebody in Washington?

A. It was from the Secretary of the Interior.

Q. Secretary Ickes? I see.

Mr. Lewin: And you were authorized to talk with any counsel if Government lawyers were present? You were told not to discuss it at all except in the presence of Government lawyers?

A. That was the understanding.

The Court: Q. Were those instructions from the Secretary of the Interior?

A. Those instructions were from the Secretary of the Interior.

2433 The Court: It is clear you were permitted to discuss this case with defense counsel if Government attorneys were present?

A. Secretary Ickes instructed me to talk with counsel for the defendants only in the presence of a representative of the Department of Justice.

The Court: He got instructions from his superior officer, and I think he better carry them out. If you talk with counsel for the defendants, do so in the presence of Government attorneys. I don't want you to lose your job.

(Documents submitted by Mr. Donovan, marked Exhibits 915 and 916 for identification.)

Mr. Donovan: Those are marked for identification in connection with our offer of proof.

(After a conference with the witness in the presence of Government counsel the following offer of proof was made.)

(The following proceedings were had in the absence of the jury.)

Mr. Donovan: This is an offer of proof in question and answer form which would be made in question and answer form if Dr. Frey were on the stand; and I ask that it be considered in that form now: (Reading offer of proof.)

"On May 13 and 14, 1935, the Petroleum Ad- 2434 ministrative Board had a conference with Mr. G. E. Willy and Mr. S. M. Vockel of the Waverly Oil Works of Pittsburgh, Pennsylvania.

"On behalf of the Petroleum Administrative Board those present were Mr. Charles Fahy, Chairman of the Board, and Mr. E. B. Swanson, and myself, members of the Board.

"At the conference on May 13th, Mr. Vockel did most of the talking. He stated that in the prior conference that he had with the Petroleum Administrative Board on April 8, 1934, he had told the Board that he wanted a 30¢ cut in the price of Pennsylvania grade crude oil. Mr. Vockel said that at this prior meeting the Petroleum Administrative Board had informed him that if he waited 30 days they felt that the situation of the small Pennsylvania refiner would be alleviated and that they had said that the prices of the refinery products in Pennsylvania would rise because of the useful and constructive work that had been going on in the southwestern states under the sponsorship of the Stabilization Committee of the Planning and Coordination Committee in connection with the refinery gasoline market, and that within 30 days this condition would benefit the entire oil industry and would be reflected back in the Pennsylvania prices. Mr. Vockel said that the 30 days had elapsed and the condition of the small Pennsylvania refiner was just the same. He then again asked the Board to take steps to reduce the price of Pennsylvania grade crude oil 30¢ a barrel. 2435

"We told Mr. Vockel that he would have to wait a little while longer, and that we still expected that the work of the Stabilization Committee in connection with refinery gasoline in the southwestern states would have a good effect on the prices for finished products in Pennsylvania within 30 days. We did not tell them that we would do anything about causing the price of crude oil in Pennsylvania to be cut. That is all I can recall about this conference. Mr. Vockel and Mr. Willy then left the Board.

"There was another conference on May 14, 1935. Mr. Willy and Mr. Vockel came back to the Petroleum Administrative Board. Mr. Fahy and Mr. Swanson were present, and I was present. The conference only lasted a few minutes.

"Mr. Fahy said that the Petroleum Administrative Board had been thinking over the situation of the Pennsylvania refiner since the conference the day before and had arrived at a solution of the difficulties. Mr. Fahy then said that he was sending a telegram to Mr. Arnott, who was in charge of stabilization work, asking him to go into Pennsylvania and work out some immediate adjustment to save the small Pennsylvania refiner. 2436

"No member of the Petroleum Administrative Board explained to Mr. Vockel and Mr. Willy what steps Mr. Arnott was to take in connection with the refinery lubricant market in Pennsylvania. We told them that we thought Mr. Arnott would look into the situation and would be able to help them in a very short time. That was all there was to the conference.

"On May 14, 1935, I was familiar with the situation of the small Pennsylvania refiner and the difficulties in the Pennsylvania situation.

"The price of crude oil was then below the normal price. I think it was selling in western Pennsylvania at $2.02 a barrel. The prices of refined products were very low and had been declining for some months. The small Pennsylvania refiners were losing 30¢ to 40¢ on each barrel of crude oil that ran through their stills.
2437 There had been overproduction of Pennsylvania grade crude oil and too much crude oil had been run through stills. The result of this was that excessive inventories of lubricants had been built up and were in the hands of the small Pennsylvania refiners and in the hands of the larger refiners. These products could be sold only at distress prices. A number of the small Pennsylvania refiners were going out of business and some of these refiners had been in business for a great many years.

"Both Mr. Swanson and Mr. Fahy at that time knew about the plight of the refiners in Pennsylvania. Messrs. Meyers and Marshall probably did not because they had been away from Washington for some months.

"As a member of the Petroleum Administrative Board I discussed the telegram Mr. Fahy sent to Mr. Arnott on May 14, 1935, with Mr. Fahy and Mr. Swanson before it was sent.

"The Petroleum Administrative Board wanted Mr. Arnott to go into Pennsylvania to help out the refinery lubricant market by the same method that the Stabilization Committee had taken in the Mid-Continent area in regard to the
2438 refinery price of gasoline. Because of the excessive inventories of Pennsylvania lubricants we believe that Mr. Arnott could make some arrangements whereby the major companies would

purchase these excessive lubricants which were overhanging the market in Pennsylvania from the small independent refiner and in that way both relieve the plight of the independent refiner and cause the prices of refinery finished products to rise to their proper parity with the price of Pennsylvania grade crude oil.

"Before sending the telegram of May 14, 1935, the Petroleum Administrative Board considered that Mr. Arnott had the Authority to undertake this work in Pennsylvania because it was part of the stabilization work which he was authorized to undertake.

"Thereafter Mr. Arnott undertook to help the Pennsylvania refiners. He made some survey in Pennsylvania and called a meeting of the Pennsylvania refiners for May 28, 1935, at the Waldorf Hotel in New York. Mr. Swanson was invited to that meeting, but the day before the Schechter decision was passed and consequently Mr. Swanson did not go. It was my understanding that the meeting was never held."

2439 Mr. Chaffetz: That proffer is objected to, for the reasons previously stated.

The Court: Objection sustained. Exception allowed.

(The following proceedings were had in the presence of the jury.)

Mr. Donovan: I would also like to have marked for identification the Annual Report of the Secretary of the Interior for the fiscal year ending June 30, 1935, with particular attention to the chapter entitled "Petroleum Administrative Board, Charles Fahy, Chairman," and more particularly to page 36 of that report.

(Document referred to be marked Exhibit 917 for identification.)

Mr. Donovan: Your Honor, in connection with the Stabilization Report I also offer this report in evidence.

Mr. Craword: Objected to as immaterial and irrelevant.

The Court: The Court will reserve its ruling on that.

Mr. Chaffetz: We are familiar with this. We object to it on the ground it is incompetent, irrele-

vant and immaterial. They don't show anything at
2440 all with respect to the issues in this case. They have nothing to do with it, and they don't even show with respect to what was taken up there, that anything was authorized of the kind of thing that is involved here.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, accepting the ruling, I only say that I want to offer those as administrative authority—administrative recognition of authority.

Mr. Chaffetz: I don't see anything—I don't see any basis for the statement of counsel now.

The Court: You may make your offer of proof.

By Mr. Donovan

Mr. Arnott appointed the Stabilization Committee under authority of the letter of July 20, 1934.

Mr. Donovan: Q. Now, did you consider that the letter, you referred to of July 20, 1934, from Mr. Ickes to Mr. Arnott, gave authority to Mr. Arnott, if the circumstances required, to deal with the problem of stabilization and markets, including the tank car market?

Mr. Crawford: I suppose that letter tells its own story. I object to it.

Mr. Donovan: I am only asking for his construction of that letter.

2441 Mr. Lewin: I would rather have the Court's construction.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, I simply renew my offer again, of this letter marked Exhibit 891 from Mr. Ickes to Mr. Arnott.

Mr. Chaffetz: We object to it. That is the same letter that was offered before. We object to it for the same reason.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Would you tell us what interpretation you, as a member of the Petroleum Administrative Board, charged with the Marketing Division, placed upon that letter of Mr. Ickes to Mr. Arnott?

Mr. Lewin: That is the same question, your

Honor. That is objected to. The letter speaks for itself. It has already been construed by the Court. The construction was that it was unambiguous and it had nothing to do with the issues in this case, as I understand it.

The Court: Objection sustained. Exception allowed.

2442 *Cross-Examination by Mr. Chaffetz.*

Q. You testified that you have exhausted your recollection and you have told us everything that Mr. Arnott said to you on that occasion, on March 12th; is that right?

A. Everything pertaining to buying.

The occasion for Mr. Arnott talking with the members of the Committee on that day was to report on general stabilization. I would not say that he mentioned this subject of buying somewhat casually and incidentally on March 12th, after reporting on his stabilization activities.

Q. Didn't he say to you that he was conducting some buying activities on his own responsibility and that he didn't want your approval—and by "you" I mean the approval of the Board—and didn't he say to you that he didn't want your blessing or your criticism?

Mr. Donovan: Awful lot of questions in that one question.

The Court: The question is clear. You may answer.

The Witness: Mr. Arnott said that—

Mr. Chaffetz: No, no.

The Court: Just answer that question.

The Witness: Repeat it, please.

2443 (Question read.)

The Court: All right. Answer that.

The Witness: Mr. Arnott stated—

Mr. Crawford: I think we are entitled to an answer to that question.

The Witness: I am trying to. If I don't give it—

The Court: Can you answer that yes or no?

The Witness: I can't answer those four questions yes or no.

The Court: Break that up.

Mr. Chaffetz: Take the first one:

Q. Did he say he was doing this sort of thing on his own responsibility?

A. Yes.

Q. Didn't he say it was purely an industrial activity and not a Code activity?

A. He did not.

Q. Are you sure of that?

A. I am.

Q. Did you ever say to anybody that he said that it was an industrial activity and not a Code activity?

A. I said that it was work that was being done by the industry—if that is what you mean.

Q. Did you say that it was being done unofficially and had no official standing?

2444 A. Yes.

Q. Yes. What do you mean by that?

A. What I said.

Q. And what does that mean?

A. That it was not definitely approved by anybody in the Petroleum Administrative Board nor by the Secretary of Interior.

Q. And he stated to you specifically that he didn't want your approval; isn't that true?

Mr. Francis: May it please the Court, I think the Court ought to stop Government counsel from using bulldozing methods on this witness. It is certainly highly improper.

Mr. Lewin: This witness can take care of himself.

The Court: He may answer that.

Mr. Francis: I want an exception.

Mr. Chaffetz: (To the witness) Is that true?

The Witness: Repeat it again, please.

The Court: Will the reporter read the question.

(Whereupon the question was read by the reporter.)

A. Mr. Arnott stated that he did not ask our blessing.

Mr. Chaffetz: Yes.

Q. And he told you, also, that he didn't want any criticism from you or from any of the members of your Board; isn't that true?

2445 A. I don't think so.

Q. Have you ever said any such thing as that to anybody else?

A. I can't recall.

Q. Did Mr. Arnott say that to you at any other time?

A. What—that he didn't want any criticism?

Q. Yes, he didn't want any criticisms or suggestions from you or from the members of the board.

Mr. Donovan: About the buying program, you are asking? Let's find out about that. Is it about the buying program?

Mr. Chaffetz: Yes, about the buying program.

The Witness: I don't think—Mr. Arnott didn't ask our approval, and he didn't ask any constructive criticism.

Mr. Chaffetz: Q. He didn't ask for any suggestions or criticism whatsoever from you with respect to the buying programs?

A. He didn't ask for it.

Q. And he said he didn't want it?

A. He didn't ask for our blessing.

Q. Yes. And he said he didn't want—he didn't ask for your blessing, and he also said he didn't want any suggestions from you, or criticism; isn't that true?

2446 A. I can't remember that.

Q. I ask you whether you remember Mr. Arnott saying that on any occasion, at that meeting, or any subsequent occasion, whether he didn't say to you—whether he didn't say to you—that he didn't invite any suggestions or criticisms from you or other members of the board.

Mr. Donovan: I would like to know if that relates to the buying program.

Mr. Chaffetz: With respect to the buying program.

A. If I ever did make such a statement, I have forgotten it.

The Court: The question is, did he ever make such a statement to you?

The Witness: I can't be sure.

I suppose Mr. Fahy raised the question as to whether there was a question of a violation of the anti-trust law involved because in the letter of July 20 it was pointed out that the stabilization work should not do anything in violation of the anti-trust laws; and naturally Mr. Fahy would raise the question, or sort of throw out the suggestion, have you considered it from this aspect. Mr. Fahy is a lawyer.

2447 Q. Dr. Frey, I want to try to clear up one or two matters that we were dealing with at the close of your previous testimony before adjournment. Do you recall when you were before the grand jury you testified in part as follows:

> "It was definitely stated to him"—that is, Mr. Arnott in your presence—"that the letter of July 20th gave him no authority, that he had no authority under the Code, and anything that was being done in that respect"—that is, with respect to the buying program—"was being done by him on his own responsibility?
>
> "Answer: And the"—

Mr. Donovan: Now, if it please the Court, I object to this form of examination, anything to do with the grand jury minutes, and I submit, as I submitted before, that those minutes if brought to the attention of Dr. Frey should be brought by the minutes themselves and not in this manner of questioning. I make the further objection so we won't have any question about this, and if he is going to ask him anything about any conference, we must place it as to what date—

Mr. Chaffetz: I am going to ask him.

Mr. Donovan: Because I am going to object to anything beyond our direct examination. Your 2448 Honor held me down to the March 12th conference, and did not permit me to go into all that occurred at that time. Now, I am going to object to anything other than March 12th.

Mr. Crawford: Although that may be true, that his direct examination was confined somewhat to March 12th, nevertheless if another conference at another time and place, or a conversation occurred which might reflect on and discredit or entirely break down what he testified to about March 12th, we are not shut out under the rules of cross-examination from going into that.

Mr. Donovan: I want to state my objection, if I may, to this manner of directing his attention to the grand jury minutes, and in order that I may be accurate about it I want to refer particularly to the objection already made upon the direct case of prosecution at R. pp. 373-74, 446, 630, 680-81, 682.

We object to the use of the grand jury testimony of this witness because the transcript of testimony of the witness before the grand jury has not been shown to be properly authenticated, and there is

no showing that such testimony was reduced to writing in the presence of the witness by the right authority, or examined by him at the time, and
2449 furthermore the record of such testimony, even if properly authenticated when contemporaneous with the facts or occurrences as to which he is now asked to testify and give such testimony was given at a time too remote from the occurrence of the fact inquired about, and likewise too remote from the date of trial to render said grand jury testimony competent for the purpose of refreshing the recollection of the witness, within the rule of *Putman* v. *United States*, 162 U. S. 687.

Mr. Thomas: I would like to add to that objection this: The use that is being made of the testimony before the grand jury in this instance is impeachment and not to refresh the recollection of the witness. If he wants to refresh the recollection of the witness the proper way to do it is to show the witness the testimony in the absence of the jury.

Mr. Chaffetz: Let me ask this question of the witness—

Mr. Donovan: Furthermore, your Honor, there is no showing here that this question is relevant to anything he said upon direct, and furthermore, there is no showing that the witness needs to have his recollection refreshed.

2450 Mr. Chaffetz: I think you will recall the proceedings before the recess. The question that I just read to the witness bears directly on the entire substance of this witness' testimony. The only purpose for which he was called was to talk about the report that he says Mr. Arnott made to him, and that testimony was offered by the defense for that purpose. Now, this deals specifically with just what it is that was said by Mr. Arnott, and what the effect is of what he says. I think it is relevant to the entire direct examination. On the question of showing the minutes—

The Court: Are you offering it to refresh his memory?

Mr. Chaffetz: To refresh his memory.

Mr. Donovan: He has not shown his recollection needs refreshing. That is the first ground, and it is not the proper way to do it.

Mr. Chaffetz: I think I have shown on the previous day—

The Court: Will you read some of the last of the cross examination, just to refresh our memory? Not the grand jury testimony, but the cross examination. How many pages is there of this witness' testimony?

Mr. Chaffetz: All his testimony is quite long, your Honor, from page 1263 to 1294.

2451 Mr. Lewin: Here is a question that may bear on that: Mr. Chaffetz' first question on cross examination was this: "Dr. Frey, you testified that you have exhausted your recollection and you have told us everything that Mr. Arnott said to you on that occasion, on March 12; isn't that right?" And his answer is: "Everything pertaining to buying."

Mr. Francis: That refers to a letter from Arnott that you mentioned.

The Court: Will you read the question now before the witness?

Mr. Chaffetz: The question now is whether he recalls having given this testimony.

Mr. Donovan: I have made my objection to that, your Honor.

The Court: Yes.

Mr. Chaffetz: It is this: There are three questions and answers about the same subject successively that I wanted to call to his mind:

> "Was it definitely stated to him in your presence"—that is, to Mr. Arnott—"that the letter of July 20th gave him no authority and that he had no authority under the code, and anything that was being done in that respect" —referring to buying programs—"was being done by him"—

2452 Mr. Donovan: What do you mean? Is that in your question, referring to buying programs?

Mr. Chaffetz: It is in my question.

Mr. Donovan: I mean is it in your question, part of your question?

Mr. Chaffetz: I am asking this witness whether he remembers having given such testimony.

Mr. Donovan: Your Honor has heard my objection. I am not going to—

Mr. Chaffetz: "And anything that was being done in that respect was being done by him on his own responsibility?

"Answer: Absolutely."

The Court: Are you making your objection?

Mr. Donovan: I made my objection, and I move to strike out that question, furthermore, your Honor.

Mr. Chaffetz: I will withdraw the question, and ask another question.

Mr. Donovan: If it please the Court, counsel now withdraws the question, having submitted it, and I ask the court to instruct the jury to disregard that question.

The Court: The jury will disregard that question and all that was said with reference to it.

2453 Mr. Chaffetz: Q. Dr. Frey, you were present at a conference on the day that court last adjourned, together with certain of opposing counsel and certain of Government counsel isn't that true?

A. Yes, sir.

Q. That conference was called for the purpose of giving the defense counsel an opportunity to ask you certain questions; isn't that true?

A. Yes, sir.

Q. In the presence of Government counsel?

A. Yes, sir.

Q. And during that conference did I read to you a small portion of your grand jury testimony?

It is true that you did read to me a portion of my grand jury testimony, and I said I remembered having so testified.

Q. Can you remember what the substance of that was that you said you remembered giving before the grand jury?

Mr. Donovan: If it please the Court, I object to this further unless it is directed to what the witness testified on his direct examination, and is directed particularly to March 12.

The Court: You may answer that question. Objection overruled. Exception allowed.

2454 Mr. Chaffetz: Q. I asked you whether you remembered the substance of that testimony.

A. Yes, I do.

Q. Can you state it?

Mr. Donovan: I object to that, your Honor.

The Court: I think you better ask your question.

Mr. Donovan: Your Honor, I think we may save time and trouble if I make the objection now. I make it particularly on the ground that it is obvious that this is done for the purpose of refreshing the recollection of the witness, and the witness, as I understand it, does not need his recollection refreshed.

The Court: It now appears the witness' recollection has been refreshed.

Mr. Donovan: That is what I object to. There is no showing he needs his recollection refreshed.

Q. Dr. Frey, do you recall that on some occasions between March and June of 1935 that it was definitely stated by a member of the Petroleum Administrative Board to Mr. Arnott in your presence that the letter of July 20, 1934, from Mr. Ickes to Mr. Arnott gave him no authority with respect to the operation of a buying program—

Mr. Donovan: I object to that.

2455 Mr. Chaffetz: Q. —and that Mr. Arnott had no authority under the Code, and anything that was being done by Mr. Arnott in that respect was being done by him on his own responsibility?

Mr. Donovan: In the first place, your Honor, the letter of July 20th was excluded. If he is going to ask the witness anything about the letter of July 20th, we ought to have it in evidence. That is number one.

Number two: There is no reference here specifically to any date other than March 12th. If he is going to any date other than March 12th, I have a further objection I wish to make, and upon which I wish to make argument, which I cannot make with propriety before this jury.

The Court: March 12th was the date he made the report?

Mr. Donovan: Yes, your Honor.

Mr. Chaffetz: Yes.

The Court: I think I have confined the defense to that report, and that report only.

Mr. Donovan: That is right.

Mr. Chaffetz: No, your Honor, the witness testified that he was in contact with Mr. Arnott down until June; and the witness was never asked 2456 by counsel about the conference of May 8th. Had they asked, we never would have objected.

The Court: My recollection was that up to now most of the witness' testimony was with relation to the report Mr. Arnott made to the Board.

Mr. Chaffetz: I ask the witness whether the subject matter of the questions I have been dealing with didn't relate to the March 12th meeting.

A. March 12th and May 8th.

Q. And May 8th, both?

A. Yes.

Mr. Chaffetz: Very well, then.

The Court: Objection sustained.

Mr. Chaffetz: Q. And do you recall at the March 12th meeting, that it was definitely stated to Mr. Arnott in your presence that the letter of July 20th gave him no authority, that he had no authority under the Code, and anything that was being done by him in respect to buying programs was being done by him on his own responsibility?

Mr. Donovan: Are you directing that to March 12th, now?

The Court: Yes, March 12th.

Mr. Chaffetz: Directing that to March 12th.

The Court: You may answer that.

2457 Mr. Donovan: Your Honor, I desire to call your Honor's attention to the fact that the letter is not in evidence.

The Court: I know that.

Mr. Chaffetz: Yes, and this shows why it shouldn't be in evidence.

The Court: This deals with the report.

The Witness: As I recall, the question of whether Mr. Arnott was operating under the letter of May, or—

Mr. Crawford: Object to that.

The Court: You understood that question?

A. Yes, sir.

The Court: Well, answer it.

Mr. Thomas: Do you want the question read, Doctor?

The Court: Do you want the question read?

The Witness: Yes, please.

The Court: Read the question.

(Question read by Reporter.)

A. I can't remember that that statement was made March 12th.

Mr. Chaffetz: Q. Do you think it may have been made on March 12th?

A. There is a possibility that it may have, but I can't recall that it was.

Q. Let me ask you this: When I asked you that question in this conference with opposing counsel, 2458 I asked you when you thought that statement was made, didn't I?

A. I don't remember.

Q. Don't you recall that you answered that it was made on March 12th? Wasn't that your best recollection when I first asked you that question.

A. Well, Mr. Chaffetz, part of it was in March 12th, but not all of it. The reason I answered the way I did is because I think part of it was on March 12th and part of it was on May 8th.

Mr. Chaffetz: All right—

Mr. Donovan: Now, I move to strike out that portion of the answer that related to May 8th.

The Court: It may stand. Exception allowed.

Mr. Chaffetz: Q. And you can't recall now which part was on March 12th, and which part was on May 8th; is that right?

Mr. Donovan: Did your Honor rule on that motion?

The Court: Yes, objection overruled, as to striking out that part. Exception by defendants.

Mr. Donovan: Then I ask also that the jury be instructed to disregard that portion of the answer that relates to May 8th.

The Court: Well, he simply says he doesn't know whether the statement was all made on March 12th or May 8th.

2459 The Witness: No, your Honor, part of it was made on March 12th, and part on May 8th.

Q. Do you know what part was made on March 12th?

A. I think I do.

Q. What was it?

A. The "anything that was being done by him was being done on his own responsibility" was made on March 12th.

Mr. Chaffetz: Q. And all the rest was made on May 8th.

A. May 8th.

Mr. Donovan: Now, may I ask a preliminary question, in view of this examination?

The Court: Yes, you may.

Mr. Donovan: Q. Did the meeting of May 8th, Dr. Frey, relate to buying, or did it relate to some other subject matter?

A. The question of buying was incidental at the May 8th meeting. The main purpose of the May 8th meeting was to discuss methods to be used by the Stabilization Committee in the carrying on of meetings and various things of that sort. It was not specifically directed to the buying.

2460 Q. Then I ask you, did the conference of May 8th relate to the subject you have discussed, and not to buying?

A. It is related to the subject which I have described, but there was an incidental discussion on buying.

Q. And did the remark to which you have referred relate to buying, or did it relate to the subject matter you have discussed?

A. It related to buying.

Mr. Chaffetz: Q. At the March 12th meeting, didn't Mr. Arnott state in his own words that what he was doing with respect to buying, he was doing on his own responsibility?

A. I have always answered that the same way—

The Court: Well, answer it now.

A. (Continuing)—that Mr. Arnott did not ask our authority for the buying program, and that he was doing it on his own responsibility.

Mr. Donovan: Q. Is that what he said, or did you characterize it—

A. That is a characterization. It is not an exact statement. I don't remember exactly what the words were that Mr. Arnott used.

Mr. Chaffetz: Q. It is a characterization of what Mr. Arnott said?

2461 A. That is right.

Q. All right. And it is your best recollection of what he said?

A. Yes.

I was not familiar with the detailed operation of the Tank Car Stabilization Committee. The Committee did not report to me from time to time. I did not attend any meetings of the Committee.

Q. On how many occasions after March 12th did Mr. Arnott report to you with respect to major company buying?

Mr. Donovan: Objection; it is beyond the direct examination, your Honor.

Mr. Lewin: He said he reported to him right along.

Mr. Chaffetz: I think he testified on direct examination, talking generally, not with respect to buying, that Mr. Arnott reported to him from time to time.

Mr. Donovan: No. He said, as I remember the testimony of the witness, he said that he kept touch with the stabilization activities under the Committee.

Mr. Chaffetz: That is right, and I want to see—

The Court: Objection overruled. Exception allowed.

2462 Mr. Donovan: And he is asking for a conference—

The Court: Overruled. He may answer. Read the question again, please.

(Question read.)

A. Several times, I don't remember exactly how many.

The occasions of those reports after March 12th were usually informal occasions when I happened to meet Mr. Arnott, or when he happened to be in the office. The only time he came in to report to us after March 12th in the way I say he reported on March 12th, when he reported at any length, was May 8th.

Q. Will you tell us how that meeting of May 8th came to be called?

Mr. Donovan: Now, if it please the Court: For the reasons I have already said at R. p. 1299, I object to that question, and if counsel persists in it, I must ask that we be permitted to make argument on it, and I think it could not be properly made before the jury.

Mr. Chaffetz: I think there is no—Colonel Donovan himself just asked the witness the question a little while ago, as to what the purpose of the May 8th conference was, and the witness answered; and he now states that he didn't state the full purpose.

2463 Mr. Donovan: Well, I make that objection, your Honor, and I ask permission that we submit argument on it.

The Court: You can, but I think we ought to find out all about it. You have asked a part; now let's find out—

Mr. Donovan: Well, your Honor, it relates to a subject that has no materiality to this case, and it is something that affects these defendants very materially, and I think that your Honor should be advised before you make a ruling on it.

The Court: Well, the jury may retire for a few moments.

(Jury retires.)

(During the course of argument before the Court the following statements were made by counsel:)

Mr. Dorr: We are not here, your Honor,—we are not here saying that we have got an iota of immunity out of the letter of July 20th, or anything else. That is not our claim, never has been. We are here to say that that is important as showing how these voluntary cooperative efforts came into effect. We are here to say that these gentlemen, the Petroleum Administration Board, thought that what we were doing was useful, and useful in the stabilization of retail markets because distress gasoline, sold as it 2464 was, was one of the contributing causes of these very price wars that the Administration was setting out to carry out. We do not claim for an instant that that letter of July 20th was a license to violate the anti-trust laws. Right in that letter, as your Honor has read, is a provision that there must be no agreement, and if Mr. Arnott finds that there is any agreement—comes across any agreement which violates—which tends toward a monopoly, which creates a monopoly, which is the very essence of the Sherman law, if any of those things appear in any of these stabilization efforts, he is to report it.

Now, we are not here claiming any immunity against the anti-trust laws. We don't think we need it.

The Court: Bring in the jury. The objections to the questions are overruled. Exception allowed.

Mr. Thomas: May there be considered the same objection relating to all the questions relating to this May 8th meeting and the same ruling?

The Court: Yes, the same objections are made and the same rulings.

(Thereupon the witness was recalled into the court room and resumed the stand, following which the jury was recalled into the court room and resumed the jury box.)

2465 Mr. Chaffetz: I will withdraw that question and ask another question.

The Court: All right.

Mr. Chaffetz: Q. Will you tell us more fully what the purpose was in calling the so-called May 8th conference?

Mr. Thomas: Now, if the Court please, I would like to have the same objections appear in the record at R. pp. 1302-04 to this question as was made to the question that was withdrawn and upon which your Honor ruled, and I would like to have the same ruling as your Honor made, and the objection need not be repeated, because I assume that the same objections will be made to the same questions as to this May 8th meeting and the same ruling by the Court.

The Court: The record may so show.

A. On April 22, we wrote a letter to Mr. Arnott, imposing three conditions on general stabilization work. At the same time we had had some complaints, especially from jobbers and also from dealers' association as to the employment of moratoria, the question of representation on stabilization committees, and some protest as to the closed meetings, or sometimes called secret meetings, which were held by stabilization committees.

2466 The stabilization committee objected to our letter of April 22nd, because they didn't think it was practical to operate under the three conditions which we imposed, and their coming to Washington to talk with us at that time was primarily to see if something couldn't be done to change those conditions so that it would be possible to work more effectively in stabilization.

It was contended that it was not always possible to have a government representative present. It was also contended that it was not always desirable to have all elements involved present at any one meeting. There were a number of considerations of that type, and this meeting of May 8th was primarily on the general problem of stabilization.

Do you want me to go on with their conclusions?

Q. No.

Mr. Donovan: Your Honor, it seems to me that if we are going into the May 8th meeting, we ought to have the whole story of May 8th.

Mr. Chaffetz: I asked only one question, your Honor. That was the only question.

A. The purpose was to adjust these difficulties which had arisen in stabilization.

Q. And wasn't the purpose also to find out just
2467 what it was that Mr. Arnott and his committees were doing, because you didn't know?

A. We always wanted to know what Mr. Arnott was doing and didn't always know.

Q. And specifically when you called this meeting, didn't you call it for the purpose of asking him to tell you what it was he was doing so that you would know?

A. Yes. We had reports from our field men as to what was being done, and we wanted Mr. Arnott to confirm or deny.

Q. Did you know—did you think you knew all the things he was doing?

A. No, sir.

Q. You thought you didn't know, isn't that right?

A. There were so many things being done, we couldn't have known everything.

Q. Didn't you think you were calling Mr. Arnott on the carpet for his failure to keep you informed?

Mr. Donovan: I object to any such characterization and ask that the jury be instructed to disregard it.

Mr. Chaffetz: Cross-examination.

Mr. Donovan: I don't care what kind of examination it is. It is an improper question.

2468 Mr. Chaffetz: I am trying to get the facts.

The Court: This witness may answer that. Exception allowed.

A. Well, if you want to put it that way, Mr. Arnott was always on the carpet, as far as we were concerned.

Q. I didn't ask you whether he was always on the carpet. I wish you would answer my question: In calling that specific conference on May 8th, wasn't your Board calling Mr. Arnott on the carpet to request him to explain to you what he had been doing?

A. Yes.

Mr. Chaffetz: I want to know only what I want to know about that conference. If he wants to ask additional questions—I asked him what representa-

Mr. J. W. Carnes was present at that meeting. He is vice-president in charge of sales of Sinclair Refining Company, and, as far as I know, he is a defendant in this case. I never looked at a complete list of the defendants. Mr. Allan Jackson was there. He is vice-president of Standard Oil Company of Indiana, and was occupying that position at that time. Mr. H. T. Ashton was there. I am not certain of Mr. Ashton's position, but I know he is connected with Socony-Vacuum in one of the subsidiaries, and was
2469 at the time. I don't know his official position. Mr. Arnott was there.

I told you at that meeting there was some discussion with respect to buying programs.

Q. And I ask you whether at that meeting with respect to buying programs, it wasn't stated to Mr. Arnott in your presence that he had no authority under the Code or under the letter of July 20th to operate any buying programs?

A. I don't know whether that statement was made exactly that way, but that subject matter of that type was incident to the conference.

Q. And that was the substance of what was said to him?

A. Yes.

Q. In your presence?

A. Yes.

The Court: Q. By whom?

A. Mr. Fahy.

Mr. Chaffetz: Q. And did not Mr. Arnott expressly state that he was not acting under any governmental authority in the operation of his buying program or buying programs?

A. He didn't put it that way. But he didn't ask for any authority from us in any of his operations.

Q. Do you remember Mr. Meyers being present at that meeting?

2470 A. I don't recall that he was.

Q. I think you are right. I don't think he was. Do you remember Mr. Arnott turning to anybody in that meeting and saying picturesquely, "We do not ask your blessing"?

A. That is my characterization of Mr. Arnott's conversation.

Q. At that meeting of May 8th?

A. That—well—I made that characterization on the meeting of March 12th. As you remember, I wrote to Mr. Meyers on March—

Q. Well, we are past March 12th now. I want to know only what was said at that meeting on May 8th. Now, I ask you whether Mr. Arnott didn't use some such language on May 8th with respect to his buying programs?

A. It is entirely possible that he did, but I characterized that conversation as of March 12th.

Q. You can't recall whether he said substantially the same thing at the May 8th conference?

A. Oh, he probably did, but I can't say for sure.

Q. Did you at that meeting of May 8th, or any time between March 12th and May 8th, have any discussion with Mr. Carnes with respect to the buying program?

Mr. Thomas: Objected to. Not cross-examination.

2471 Mr. Donovan: Certainly that hasn't been opened up on direct examination.

Mr. Lewin: Mr. Carnes was present at that same meeting.

Mr. Donovan: That doesn't make any difference.

The Court: Overruled. Exception allowed.

A. I can't remember whether I saw Mr. Carnes between March 12th and May 8th or not. I may have, but I wouldn't be sure. I certainly saw Mr. Carnes sometime between March 12th and May 25th, but I don't know just exactly when.

Mr. Chaffetz: Q. Do you recall Mr. Carnes saying to you that his company, Sinclair Refining Company, was buying more gasoline than it had any immediate need for, but they felt they had to do it, in order to bring about stabilization?

Mr. Thomas: Objected to. Not cross-examination.

Mr. Chaffetz: The broad question was asked the witness on direct examination, "What was your contact with the activities of the Tank Car Stabilization Committee?" This is information that he got.

The Court: Objection overruled. Exception allowed.

2472 The Court: Mr. Carnes was a sales representative of Sinclair?

Mr. Chaffetz: Vice-president in charge of sales, of Sinclair Refining Company, shown in this case to be buying in the Mid-Continent buying program—

Mr. Lewin: And in East Texas.

Mr. Chaffetz: (Continuing)—and also in East Texas.

Mr. Thomas: And on the direct examination, no reference was made whatever to any conversation with Mr. Carnes, and I object to going into it at this time on cross-examination, because it isn't proper unless they make this man their own witness. If they want to make him their own witness, of course, that is different.

Mr. Chaffetz: Q. Wasn't Mr. Carnes a member of the General Stabilization Committee?

A. Yes, he was.

Mr. Chaffetz: Yes—

The Court: Objection overruled. You may answer. Exception allowed.

The Witness: Will you repeat the question, please?

(Question read.)

A. I remember that Mr. Carnes reported to 2473 me—or, not reported—it wasn't necessary for him to report—he said to me, one time when I saw him—exactly when, I don't know—that their company was continuing buying. I am not sure about the rest of the statement.

Mr. Chaffetz: Q. If your testimony before the grand jury was read to you, might that refresh your mind?

A. It wouldn't make any difference, because that was a year later, too, and I couldn't be positive.

Q. If you volunteered that testimony before the grand jury, without any introduction at all from anybody else, wouldn't that lead you to believe that you were telling the truth?

Mr. Donovan: I object to that question, your Honor, as a means of refreshing the recollection.

The Court: If you want to refresh his recollection, you may do so, if you want to ask him the question.

Mr. Lewin: Show that to the Court.

Mr. Chaffetz: If your Honor please—

Mr. Donovan: May it please the Court: If counsel intends asking that question, referring to the grand jury minutes, I make the same objection that 2474 I made before, your Honor, in relation to refreshing by means of grand jury minutes—

Mr. Chaffetz: I will ask the question—

Mr. Donovan: Just a minute—and the method that should be followed. Such objections appear at R. pp. 373-74, 446, 630, 680-81, 682, 1295-97.

Mr. Chaffetz: Q. I will ask this question: Between March and May, 1935, did you hear one man, Jack Carnes, say that they were buying more than they had any immediate need for, but they felt they had to do it in order to bring about stabilization?

Mr. Donovan: Now, if it please the Court: I submit to your Honor that this cannot be for the purpose of refreshing; it must be for the purpose of impeaching.

The Court: He is not reading now from the grand jury testimony, as I understand.

Mr. Donovan: Yes, he is, your Honor.

Mr. Francis: He is supposed to be.

The Court: He asked this as an independent question, as I understood, right now.

Mr. Donovan: But as he read that, he was holding in his hand what appeared to be grand jury minutes.

Mr. Chaffetz: You don't know that.

Mr. Donovan: I said what appeared to be.

2475. Mr. Chaffetz: And I understand, your Honor, that I have got to ask the direct question before I can use the grand jury minutes.

The Court: Yes. You may answer that question. Exception allowed.

(Question read by Reporter.)

A. It would have to be the same answer I made before. I do remember that Mr. Carnes talked with me, and he indicated that the Sinclair Company was buying gasoline. I can't remember for sure at this time whether he said that it was necessary for stabilization or not; that may have been said. If it was, I don't recall it exactly now.

Q. Do you recall testifying before the grand jury on July 21, 1936?

A. I remember testifying before the grand jury, somewhere about that time, yes.

Q. Yes. And you recall, before that grand jury, you were asked about conversations you may have had with different individuals; is that right?

Mr. Donovan: Well, I object, your Honor. It is very clear, it seems to me, and it must be to your Honor, that this is not for the purpose of refreshing recollection; this is for the purpose of impeachment.

Mr. Crawford: All right. That is what it is for. 2476

The Court: Well, let's find out.

Mr. Donovan: Then, if it is for impeachment, this is an improper way to do it.

The Court: As I understand, it is to refresh recollection.

Mr. Chaffetz: It is, your Honor.

Mr. Donovan: But counsel just said it was for the purpose of impeachment.

Mr. Chaffetz: I may use it for impeachment later on. At this stage, it is for the purpose of refreshing recollection.

Mr. Thomas: If you are asking it for the purpose of impeachment, we must ask that his document which you are using be marked for identification, and be made available to the defendants on the redirect examination.

Mr. Crawford: Counsel knows what he is doing it for, and I didn't, and I withdraw the statement that it was for impeachment purposes.

Mr. Francis: But it was so obvious to everybody in the court room that Mr. Crawford would have to characterize it for what it was.

Mr. Chaffetz: This testimony isn't going to do me any good for impeachment; I want it for affirmative evidence, if I can get it.

2477 Mr. Donovan: Your Honor, I still make the same objection I made at R. pp. 373-74, 446, 518-19, 630, 680-81, 682, 1295-97.

Mr. Chaffetz: The pending question, as I understand it is: Were you asked before the grand jury about conversations you may have had with various individuals who were named?

Mr. Donovan: Your Honor, I ask for a ruling.

The Court: Objection sustained. We are getting too close to the edge here. If you want that grand jury record in here, you will get it, I am afraid—

Mr. Chaffetz: I am not offering it for impeachment, your Honor. It won't do me any good for impeachment; I want it for affirmative evidence—

The Court: Yes.

Mr. Chaffetz: Q. I ask you this question now: If you volunteered such a statement to the grand jury at the time you were before the grand jury, then must that statement not have been true, and didn't you believe it to be true at the time you volunteered it?

Mr. Donovan: Now, if it please the Court: Just think of the ifs and the assumptions in that question. Furthermore, I object to it upon the ground 2478 that your Honor has already ruled on, when it had fewer ifs than it has now.

Mr. Chaffetz: It has only one if, and that is: If you said it, wasn't it true? That is all I am asking.

The Court: You may answer that. Exception allowed.

Mr. Thomas: Before the witness answers, I make the same objection which was made originally this morning, and read into the record by Colonel Donovan. I also object to it on the ground that it is not cross-examination; I object to it on the ground that it is impeachment, and the proper foundation has not been laid; and if the grand jury testimony is to be used in that manner, I ask that the testimony be marked for identification, and be made available to the defense so that we may have it for use on the redirect.

The Court: I think I will have to sustain the objection to that.

Mr. Kelleher: Ask him if he said it.

Mr. Chaffetz: Q. Did you state before the grand jury that you heard one man, Jack Carnes, say that they were buying more than they had any immmediate need for, but they felt they had to do it in order to bring about stabilization?

Mr. Thomas: I object to that.

2479 Mr. Wood: May I ask Mr. Chaffetz if he is reading from the grand jury minutes in framing that question?

Mr. Lewin: What difference does it make? He can phrase his question with reference to any notes he may have.

Mr. Francis: You don't mean to say that those are notes that he has there, do you?

Mr. Lewin: Of course, they are notes.

Mr. Wood: Your Honor, I am addressing my question to Mr. Chaffetz, and not to Mr. Lewin. May I ask Mr. Chaffetz if he is reading from the grand jury minutes?

Mr. Lewin: Don't answer it at all.

Mr. Chaffetz: I would rather not answer the question at this time; but I will answer, if your Honor instructs me to.

The Court: You may answer it.

Mr. Chaffetz: I am reading from the grand jury minutes.

Mr. Wood: Then I ask that the minutes be marked for identification, and be made available on the further examination of this witness, as it is perfectly apparent that the question is not asked for the purpose of refreshing recollection, but for the purpose of impeachment.

2480 Mr. Chaffetz: I can only re-affirm my statement that this is important testimony; I want it as affirmative testimony in the record. It is a long time ago, and I am trying to refresh the witness' memory.

The Court: All right. Objection overruled. Exception allowed.

Mr. Donovan: Then, your Honor, in view of the statement of the counsel that he wants it for affirmative testimony, grand jury questions and answers cannot be used for affirmative testimony. It can only be used for the purpose of refreshing recollection or for impeachment.

The Court: As I understand, counsel is now attempting to refresh the witness' memory; and he may do so by reference to the grand jury testimony.

Mr. Wood: He has asked that question twice, if your Honor please.

The Court: All right. Then let the witness answer it.

Mr. Wood: I renew my motion, and I would like a ruling on it, that the paper which Mr. Chaffetz has in his hand be marked for identification and be made available on the redirect examination of this witness.

The Court: Your motion is denied. Exception al-
2481 lowed.

Now, you have heard the question. Does that refresh your memory?

Mr. Chaffetz: No, your Honor. The question was, did he so testify when he was before the grand jury? That is the question.

Mr. Donovan: That is an improper question, your Honor. It is obvious that it is not being used for the purpose of refreshment.

Mr. Chaffetz: No. Then the next question will be whether it refreshes his recollection.

Mr. Lewin: Your Honor, that was just the form your Honor followed when we had the other witnesses—

The Court: Let me see that.

(Document purporting to be the transcript of testimony before the grand jury is handed to the Court by Mr. Chaffetz, and examined by the Court.)

Mr. Wood: In view of counsel's last question, I renew my motion that the paper be marked for identification, and be made available on redirect examination.

Mr. Francis: May the record now, your Honor, reflect that the Court is reading from the same document that Mr. Chaffetz was reading from?

The Court: Yes. I think the procedure we will follow in this case, a little later on, or now, if you wish—the witness may retire, and you may—the witness may retire to another room, and you may read that testimony to him that he gave before the grand jury, for the purpose of refreshing his memory, and then recall him later.

Mr. Chaffetz: We will do that later, your Honor.

The Court: All right.

Mr. Chaffetz: Q. Were any reports by Mr. Arnott or any member of any stabilization committee, with reference to buying programs, made to you after May 27, 1935?

A. No.

Mr. Chaffetz: That is all I have of this witness, your Honor, except for that one question; so, if we may have a recess, now, we will follow the procedure your Honor suggested.

The Court: We will take a recess.

(Following the recess, the following proceedings were had before the Court and jury.)

Mr. Chaffetz: Q. Now, I ask you, Dr. Frey, whether you recall having a conversation with Mr. J. W. Carnes in the spring of 1935 with respect to the buying programs?

A. Yes.

Q. Do you recall Mr. Carnes making a personal remark to you at that time to the effect that his com-

2483 pany, the Sinclair Refining Company, was buying more gasoline than it had any immediate need for, and that they were doing it in order to aid in bringing about stabilization?

A. I remember that he made the statement that they were buying gasoline, more gasoline than they had immediate need for. The last part of the question I cannot be sure about.

Redirect Examination by Mr. Donovan.

Q. When was it that you talked with Mr. Carnes?

A. I don't remember the date, but sometime between March 12th and May 25th.

Q. Did you tell him to stop buying.

A. No.

Q. Why didn't you tell him to stop?

Mr. Chaffetz. That is objected to as incompetent, irrelevant and immaterial.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Could you have stopped him if you wanted to?

Mr. Chaffetz: That is objected to as incompetent, irrelevant and immaterial.

The Court: Same ruling. Exception allowed.

2484 The Court: Q. You had no authority, did you? Could you tell him to buy or not to buy?

A. If we had told him to stop that I think he would have.

Mr. Chaffetz: I ask that answer be stricken out. It is not responsive to your Honor's question.

The Court: It is not responsive. I asked you if you had any authority to stop him from buying?

A. No.

Mr. Chaffetz: Then I ask that answer be stricken out.

The Court: The answer may be stricken out. Exception allowed.

Mr. Donovan: Q. Then I ask you the question, if you had told him to stop would he have stopped?

Mr. Lewin: We object on the same ground.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Did you believe that buying was helpful to stabilization?

Mr. Chaffetz: That is objected to as incompetent, irrelevant and immaterial.

The Court: I will let him answer that.

A. Yes.

Those gentlemen who were present at the meeting
2485 of May 8th, and whom I have named, were members
of the Stabilization Committee of which Mr. Arnott was chairman. They were there in that capacity. James D. Collett, chairman of the P. and C. Committee, was present on that occasion.

Q. Was not the purpose of that meeting to discuss the so-called Chicago moratorium?

A. That was one of the subjects.

The Chicago moratorium was a recommendation on the part of the stabilization committee in Illinois to have a period in which there would not be any transfer of dealers between jobbers.

Q. That was the purpose of calling this meeting?

Mr. Chaffetz: That is objected to. We have what the witness said. It is contrary to his testimony, and is leading.

The Court: He said that was one of the things discussed.

Mr. Chaffetz: He said that was one of the things.

The Court: Objection sustained. Exception allowed.

I cannot recall that we had prepared an agenda or a schedule of what was to be discussed at that meeting. Mr. Shaughnessy, as I recall, did not prepare an agenda,
2486 but he did prepare a summary of stabilization work.

Q. You don't know whether or not he prepared any agenda or schedule for the meeting of May 8th? Do you recall that?

A. I think the question is rather as to the meaning of the word "agenda" there. It was not a definite program in the sense that you usually think of the word "agenda." It was a report made to Mr. Fahy by Mr. Shaughnessy covering the entire question of stabilization. That is, it was more comprehensive than just a program of events that was to be taken up.

I do not recall that before the meeting of May 8th, Mr. Shaughnessy prepared a memorandum or program or a list of matters that were to be discussed at the meeting of

May 8th. Mr. Shaughnessy was one of the attorneys of the P. A. B. at that time.

Q. Now, Doctor, did you as a member of the Petroleum Administrative Board consider the dumping of distress gasoline upon the market as an unfair practice in the oil industry?

Mr. Chaffetz: That is objected to. "Unfair practice" is a legal term. It is a question for the court and jury to decide what is fair and what is not fair. The question calls for a conclusion.

2487 Mr. Lewin: I was objecting to it on this ground: that after all the issue here, as we have debated so many times, is whether or not there was a conspiracy to fix prices. That is our issue. And if that was so, then it does not make any difference what anybody thought about the wisdom or unwisdom of dumping distress gasoline on the market. The term "distress gasoline" is susceptible of all kinds of construction. There is not anything here we think that could be gained by having Dr. Frey's personal opinion about whether it would be wise to stop the dumping of distress gasoline, if there was dumping of distress gasoline, all of which is assumed.

We think the question of the "rule of reason" so-called is eliminated from this case. There was some suggestion that perhaps this case might be one within the Appalachian Coals case. It is perfectly apparent now that it cannot be; that the evidence brings it within the Trenton Potteries case, which is the law of the land, and prevents these opinions from the people who had no authority to carry out their opinions.

It might be well to have had legislation to have dealt with lots of these things, but that is not the question before the court. The question is whether these people conspired to fix prices. 2488

Mr. Chaffetz: May I supplement my colleague's objection?

The Court: Yes.

Mr. Chaffetz: By pointing out that if this was an unfair practice, if it was, the way to deal with it was through the Code. The N. R. A. was in force at that time. The Code was supposed to have dealt with unfair practices. There was the provision in the Code, with which your Honor is familiar, that dealt with this subject, which indicated the way it was to be dealt with under the Code.

It appearing that there is no evidence that this was submitted under the Code, I think we go very far afield when we go into the question of one man's opinion as to what should be done or should not be done, when nothing was done in compliance with the law.

Mr. Donovan: Now, we desire to show exactly what was done between the members of the P. A. B. Board and these defendants in relation to this matter of distress gasoline, and as bearing upon that it is very important for us to show that this witness, who was a member of the P. A. B., who was charged specifically with dealing with these marketing con-2489 ditions, as to how he, in the administration of the marketing provisions of the Code, how he regarded the dumping of distress gasoline.

The Court: The objection is sustained. Exception allowed.

Mr. Donovan: Q. Did you, as a member of the Petroleum Administrative Board, know that there were large quantities of distress gasoline in the hands of independent refiners, both in the East Texas and in the Mid-Continent fields, during the period from February 1 to June 1, 1935?

Mr. Lewin: Now, your Honor, we submit that nothing short of approval could matter. His knowledge of what independent refiners had, or of their plight, or of how much they had or anything of the sort, couldn't possibly justify these gentlemen in buying up the gasoline, could it?

Mr Donovan: I am asking for his knowledge.

Mr. Chaffetz: There is the further objection that this isn't proper redirect examination. The subject wasn't gone into on either direct or cross, and Mr. Thomas was laying down some rules for me to follow on cross-examination.

The Court: Objection sustained. Exception allowed.

Q. Now, as a member of the Petroleum Admin-2490 istrative Board, did you, Dr. Frey, encourage industry action to bring about a parity between the price of crude oil and the tank car price of gasoline?

Mr. Chaffetz: That is objected to, in view of the testimony from this very witness that, with respect to the matters now in controversy, they specifically said in his presence that they were not asking for approval under the Code; that what they were doing, they were doing on their own responsibility—I submit to the Court that the question is immaterial and irrelevant.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Doctor, do you know of your own knowledge whether or not the chairman of the Petroleum Administrative Board, Mr. Fahy, urged industrial action to bring about this parity?

Mr. Lewin: That is the same objection; the same question exactly.

The Court: Q. Did Mr. Fahy have any more authority than any other member of the Board?

A. No, he didn't have any more authority.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Do you know whether or not 2491 Administrator Ickes urged industry action to bring about a parity between the price of crude and the price of gasoline?

Mr. Chaffetz: That is objected to. If he urged it, he obviously urged it in compliance with the law. If he told anybody to do anything, or asked anybody to do it, he did it lawfully.

The Court: Well, I will say this: What Mr. Ickes said after March, 1935, I think would be material. You may answer that, after March of 1935.

A. Secretary Ickes favored parity between crude—

Mr. Chaffetz: That isn't answering the question.

The Court: You just answer the question. You can answer that by yes or no; don't go off on a long speech.

A. Yes.

Q. What did he say?

Mr. Chaffetz: After March 12, 1935?

The Court: Q. And where did he say it, and whom did he say it to?

2492 A. He said it in the presence of members of the P. A. B. in his office, following the submission of the Blazer report—that would be following March 15th —that if a parity between crude oil prices and gasoline was not, did not come about soon, that within three or four weeks, he would call a meeting of representatives of the industry to see what could be done about it.

Mr. Donovan: Q. What was the Blazer report, that you speak of?

A. The Blazer report was the so-called report on small industries; it was called for by Secretary Ickes at our request, to get recommendations as to what should be done to overcome the difficulties which were then facing the industry.

Q. And who appointed that committee?

A. Secretary Ickes.

Q. And when did he appoint that committee?

A. I don't remember the exact date, but it must have been about January, 1935; somewhere early in January, 1935; I don't know the exact date.

Q. I show you Exhibit 894 in evidence, which is a letter dated February 1, from Charles Fahy, chairman, to Mr. I. A. O'Shaughnessy, Globe Oil & Refining Company, and direct your attention to this sentence:

2493 > "We are hoping soon for a report from the special committee which the Secretary appointed to look into this kind of thing and make recommendations."

Do you know whether or not that special committee to which he refers is the Blazer committee?

A. Yes, I think it was.

That Blazer committee made a report to Secretary Ickes.

(Document submitted by Mr. Donovan marked Exhibit 918 for identification.)

Exhibit 918 for identification is a copy of the Blazer report.

The members of that committee were on special duty for the Government. They were paid a per diem. I think I recall the membership: Mr. Blazer, Mr. Swensrud, Mr. Hoagland, Mr. Allen, and Mr. Fell. I didn't confer with that committee during the progress of their work. After their report was completed, I did not discuss that report with them as a committee, but I talked with various individuals on that committee afterwards. It was our object not to talk with them during the period that they were writing it.

I know the positions in the industry that those various members of the committee held. Mr. Blazer was president of Ashland Refining Company, an independent re-
2494 finer in Kentucky. Mr. Swensrud was in the office of the president of Standard Oil Company of Ohio. Mr. Allen was a member of the Central Proration Committee

of California. Mr. Hoagland was president of Spur Distributing Company. Mr. Fell was a labor leader. I am not so sure about Mr. Fell, because I think the Labor Relations Board suggested Mr. Fell.

Mr. Donovan: Referring to Exhibit 918 for identification, which is the so-called Blazer report, I offer in evidence pages 30 to 32, both inclusive.

Mr. Chaffetz: Q. Dr. Frey, was that Blazer report ever adopted by the Secretary of the Interior?

A. No action was taken on it.

Mr. Chaffetz: We object to the introduction of the report on that ground, your Honor.

The Court: Objection sustained. Exception allowed.

(Document submitted by Mr. Donovan marked Exhibit 919 for identification.)

Mr. Donovan: I offer in evidence EXHIBIT 919, which is the certified copy of a duplicate original of five letters, dated March 26, 1935, signed by Harold L. Ickes, and addressed to H. B. Fell; Mason Hoag-
2495 land; Robert E. Allen; Sidney Swensrud; and Paul G. Blazer, these being the gentlemen referred to by the witness as members of the Blazer Committee.

Your Honor, I would like to offer at the same time, because it may have a bearing upon your ruling, EXHIBIT 920 for identification, which is a duplicate original of a letter dated April 8, 1935, signed by Charles Fahy, who is the chairman of the P. A. B. Board, and sent to J. D. Collett, who was the chairman of the P. and C. Committee; and I offer that letter in evidence, which shows or indicates that action was taken on that report.

Mr. Chaffetz: I think it indicates that action was not taken; and I think the letter confirms the statement of the witness that no action was taken; and I object to each of these exhibits severally on the ground that they are immaterial and irrelevant.

(Document submitted by Mr. Donovan marked Exhibit 921 for identification.)

Mr. Donovan: I offer in evidence certified copy, being EXHIBIT 921 for identification, duplicate original of a telegram dated April 23, 1935, from Charles Fahy, who was chairman of the P. A. B.
2496 Board, to Paul G. Blazer, who is chairman of the Blazer Committee.

Mr. Chaffetz: I object to that, also on the same ground, your Honor; immaterial and irrelevant.

Mr. Donovan: And also a telegram dated April 23, 1935, from Paul G. Blazer to Charles Fahy, being a reply to that telegram.

(Document referred to marked Exhibit 922 for identification.)

Mr. Chaffetz: Same objection.

(Document submitted by Mr. Donovan marked Exhibit 923 for identification.)

Mr. Donovan: Press release, dated May 7, 1935, issued by the Department of the Interior, relative to the report of the Blazer Committee; and I offer that in evidence.

Mr. Chaffetz: I object to it on the same ground.

Mr. Donovan: Your Honor, may I say this: This goes directly to the point that knowledge of these activities were brought to the attention of the Secretary of the Interior; that a press release was issued in relation to the Blazer report, which referred to these activities; that action was taken by the P. A. B., in referring the matter to the P. and C. Committee; and that final action was not taken for the reason stated in that press release.

2497 The Court: (To the witness.) Q. You are familiar with that release, are you?

The Witness: A. Yes, I remember that.

The Court: Q. You are familiar with that release?

A. Yes, sir.

Q. Who gave that out?

A. It went through the Secretary's office. It originated in our office. That was the usual custom. We prepared all press releases, and then they went to the Secretary's office for approval.

Q. And were released from his office?

A. Released in his office. We had no section ourselves. Everything went through the publicity—I think it was the Publicity Division of the Department of the Interior, by way of the Secretary's office.

Mr. Chaffetz: Q. You don't mean to say that this went over the Secretary's desk personally; that he saw it personally?

A. I cannot say without following this thing through, whether the Secretary signed that personally or not, but it was the custom for him to do it.

Q. And isn't this true, that you and one or two other members of the board made the decision not to 2498 take any action on the Blazer report, and your decision was that you just publish it?

A. We decided not to answer the report one way or the other—that is, not to challenge the report nor to agree with it, but to put it out as is.

Q. Just to publish it?

A. Yes.

Q. And that is what you did?

A. Yes.

The Court: Q. Were all the press releases we are concerned here with issued out of the Secretary of the Interior's office? I am now referring to the release of the Blazer report.

A. The Blazer Committee was the Secretary's committee, and we tried to keep clear of it as far as we could because it was their recommendation to the Secretary, so it was the Secretary's office that was responsible.

Mr. Lewin: The press release itself shows on the top of it that it was issued from the Petroleum Administrative Board.

Mr. Chaffetz: Q. And didn't you testify five minutes ago in answer to my question that you and one or two members of the board were the ones who made the decision as to what to do about that report, and 2499 you decided to do nothing? Isn't that right?

A. We decided not to act, neither to take up the cudgel for it nor against it.

Q. That is right.

A. But to have it published.

Q. That is right, and that was what was done.

Mr. Donovan: Q. Whatever action you took, you had it published?

A. We did.

The Court: Q. Just how did that get into the hands of the press, who prepared it, and by what—(showing exhibit to witness)

A. Without having the full carbon I would not be positive, but the usual procedure was for this to be prepared by the Petroleum Administrative Board, usually signed by three members of the Board. It was then sent to the office of the Secretary. Now, just exactly what happened in the office of the Secretary I cannot be positive about, except that it went to his office first, and then from there to the press section or this mimeographing section where it is prepared for the press.

Q. Then who releases it?

A. It is released by the Department.

Q. Who in the Department of the Interior re-

2500 leased this particular document?

A. This would be released by the press section, that is, the information given to the information division; that was the official contact with the newspaper people.

The Court: Exhibits 919, 920, 921, 918, 922 and 923 have been offered in evidence. The objection of the government to all of these exhibits except Exhibit 923 is sustained. The objection to Exhibit 923 is overruled.

Mr. Donovan: I may have an exception to that, your Honor?

The Court: Yes.

(Document referred to is received in evidence as EXHIBIT 923, and read to the jury.)

(Document submitted by Mr. Donovan marked Exhibit 924 for identification.)

Mr. Chaffetz: You might tell the Court you are offering the Blazer report in another form.

Mr. Donovan: No, I am not. I never offered the Blazer report as a whole. I offered a particular part of the Blazer report. (Handing document to the Court.)

The Court: (To the witness) Q. Was that last release that was just read to the jury, was that published by the papers?

A. Yes, sir, I think quite extensively.

2501 (The Court reads document silently.)

Mr. Chaffetz: Does your Honor understand that is the same document you had in your hands a few minutes ago?

The Court: I know it is. Objection sustained. Exception allowed.

Mr. Donovan: Your Honor, now having offered it generally, I offer it specially for the purpose of showing that there was no secretiveness or furtiveness on the part of these defendants and that this particular activity of buying referred to in the report was brought directly to the attention of Secretary Ickes. I offer it specially for that purpose.

The Court: The objection is made, and the objection is sustained. Exception allowed.

Mr. Wood: Your Honor please, I would also like to offer this report, preceding report, in the evidence of this witness, as to his subsequent conversations and his beliefs in respect to various questions that have been asked of him on these further grounds:

First, upon the ground that they establish knowledge and acquiescence on the part of the governmental authorities, irrespective of whether, taken with other circumstances, they established approval.

2502 And also upon the ground that they bear on the reasonableness of the conduct of the defendants and of their objective.

The Court: The objection is sustained. Exception allowed.

Mr. Donovan: Q. Now, Doctor, after the meeting in March—after the meeting in March, on March 12, 1935, you told us that Mr. Arnott explained to you the buying activities that were then going on; is that correct? Am I right about that?

Mr. Lewin: Yes.

A. Yes.

Mr. Donovan: Q. And after that meeting, did you regard those buying activities as a contributing factor in bringing about parity between the price of crude and the price of gasoline?

Mr. Chaffetz: That is objected to, your Honor. It doesn't make any difference what this witness regarded.

Mr. Lewin: It is the same question. We had a number of those before. He wants this man's opinion.

Mr. Donovan: Here is the man who was in charge of marketing—

2503 Mr. Lewin: They ought to have gotten the opinion of Congress, we think.

Mr. Chaffetz: If they wanted his sanction or his approval, there was only one way to do it. When Mr. Arnott was in there that day, he should have said, "We want the approval of the Government." He said the contrary; and they can't now, two years later, get that approval through any subordinate of the department.

Mr. Donovan: I am not asking for any sanction at all, your Honor. I am asking if he believed that these activities were a contributing factor in bringing about parity between the price of crude and the price of gasoline.

Mr. Lewin: Suppose he believed it was so lily-white that it ought to be a portion of the Bible, it still wouldn't have any effect in this case. His opinion doesn't amount to a row of beans in this case; this gentleman's opinion couldn't possibly have any bearing.

The Court: This man had no authority to act, one way or the other. This witness has already testified that he didn't make any report of Mr. Arnott's report to him to Secretary Ickes. All right. Apparently you didn't attach enough importance to that report he made to you to convey it to Mr. Ickes; is 2504 that true?

A. No, sir.

Q. Then why didn't you convey it to Mr. Ickes?

A. I am not the responsible reporting officer. Mr. Fahy is the responsible reporting officer.

Q. Just what are your duties down there—what were your duties at this time?

A. I was a member of the Petroleum Administrative Board. Mr. Fahy was the chairman of the Petroleum Administrative Board.

Q. I asked you this morning if he had any more authority than you had on that Board, and you said no.

A. He had no more authority, but he was the direct reporting officer. We always reported through Mr. Fahy to the Secretary.

Q. In writing?

A. No, not necessarily; sometimes yes, and sometimes no; but Mr. Fahy, we always assumed, was the person that should go from our group and talk with the Secretary, or have us prepare a memorandum for his signature, for the Secretary. He had more responsibility; he didn't have any more authority. None of us were given the authority to sign anything for the Secretary.

Mr. Chaffetz: I think we have gotten away from 2505 the objection, your Honor. The objection—the question was, the narrow question, was this thing that was done outside the Code the contributing factor to carrying out what counsel referred to as an objective of the Code?

Your Honor has said that the only question, so far as the Court is concerned, is whether they acted within the Code in carrying out the objectives of the Code. If they did, it is immaterial whether what they did had any relation to those objectives.

The Court: The objection to this last question is sustained. Exception allowed.

By Mr. Donovan:

Distress gasoline is gasoline that is forced on the market for one circumstance or another, usually at a lower price than that prevailing in the market. It is almost always due to a condition of over-supply, where the refiner is not in a position to finance the holding of that gasoline over a longer period of time.

Q. Was it your observation, as a member of the Petroleum Administrative Board, that distress gasoline, the distress gasoline of independent refiners, was one of the obstacles which, in January and February, 1935, was preventing the price of gasoline
2506 from rising to parity with the price of $1.00 crude?

A. Yes.

Q. Was hot oil an obstacle to such parity at that time?

A. Up to March 1st, yes; that is, between the break-down of one—

Q. In January and February?

A. Yes.

Q. What was the policy of the Oil Administration in relation to these obstacles which existed to the restoration of the price of refined gasoline to parity with crude?

Mr. Chaffetz: That is objected to. The policy of the Administration is disclosed in the Code and the lawful orders issued under the Code; and there is nothing in the Code that deals with the subject of buying programs, except the provision that your Honor is familiar with; and, as we have said time and again, they haven't brought themselves under that provision.

The Court: Objection sustained. Exception allowed.

Q. Was it recognized by the Oil Administrator that, after the price of crude oil reached a dollar, that the price of gasoline was below parity with dollar crude?

2507 Mr. Chaffetz: That is objected to on the same reasons; it is the same question in another form.

The Court: Objection sustained. Exception allowed.

The Secretary did consider that it was an undesirable state of affairs for the price of gasoline at the refinery not to be in parity with crude, and it was particularly hard on independent refiners.

Q. What relation, if any, did the sale of gasoline at distress prices have to price wars?

A. It encouraged the number of them, and intensified the price differentials.

By intensifying the price differentials, I mean that those who normally sold below the regular price of the majors had a large differential; that is, they could sell at a greater difference through the presence of distress gasoline. That was very frequently responsible for price wars.

Q. And at the March 12th conference, did you, or to your knowledge did any other member of the P. A. B. Board, the Petroleum Administrative Board, tell Mr. Arnott to stop buying activities?

Mr. Chaffetz: I object to it, your Honor, on any ground. As I say, when they came in here and said they weren't asking for any approval, that they were 2508 going ahead and doing it on their own responsibility, I don't think it matters an iota whether anybody said they should stop or shouldn't stop. They said they were going on, and they were going on their own responsibility, they don't want your approval. Talk about—what is the word that Judge Denton likes to use—

Mr. Lewin: Entrapment

Mr. Chaffetz: (Continuing) —instigation or entrapment—where you come to a Government officer and say, "I don't want your approval; I am going to do this, and I am going to do it on my own responsibility"—and then, when you are charged with doing it on your own responsibility, you say; "Well, you didn't tell me to stop."

Mr. Donovan: Let's find out about this, your Honor. Let's hear what took place there.

Mr. Chaffetz: We have heard it.

Mr. Donovan: We have heard your side of it.

Mr. Chaffetz: We have heard it already. I object to that question.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: At the March 12th meeting did Mr. Arnott use the words, "I am not asking your blessing"? Did he use those words?

2509 Mr. Lewin: Your Honor, that has already been testified to.

Mr. Donovan: Well, I have not asked about that, your Honor. I have not had a chance to ask it.

The Court: He has already testified to the use of those words. Now you may ask him.

Mr. Donovan: Well, I am asking if Mr. Arnott used that expression?

A. I do not recall the exact words that Mr. Arnott used. That is my own characterization.

Q. Then is your answer that he did not use those words?

Mr. Crawford: Now, I object to that.

The Court: Yes; objection sustained. Exception allowed. Now, let me see the cross-examination of this witness.

Mr. Donovan: Q. In May, 1935, subsequent to May 8th, was the question of lack of parity between the production of the Pennsylvania refineries of crude oil brought to the attention of the Petroleum Administration Board?

Mr. Chaffetz: That is objected to as immaterial and irrelevant, something about Pennsylvania.

Mr. Donovan: I would like to show why that

2510 is material.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: I would like to ask some questions on that in order to make an offer of proof.

The Court: Make your offer of proof in writing, and I will determine whether any of that shall be received.

Mr. Donovan: May the jury be excused, and I ask the witness these questions now without the presence of the jury?

Mr. Chaffetz: I do not see any basis.

Mr. Donovan: Obviously if I undertake to make an offer of proof when I have not asked the questions of the witness, I have not laid any proper foundation for my offer of proof. That is obvious.

The Court: If in your offer of proof you also indicate the questions you wish to ask the witness, to lay the foundation, the Court will pass upon them.

Mr. Donovan: But that has not been made, and it is not in the record by questions to the witness.

The Court: I can determine it.

Mr. Donovan: I can ask these. It will be simpler if the jury be excused and I ask the questions 2511 of the witness in order to lay the foundation for my offer of proof.

The Court: I am not going to take this jury back and forth. If you have an offer of proof you may submit it in writing.

Q. Did you and other members of the Petroleum Administrative Board confer with certain Pennsylvania refiners?

Mr. Chaffetz: Objected to.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. On May 14, 1935?

Mr. Chaffetz: Objected to.

The Court: Objection sustained. Exception allowed.

Mr. Chaffetz: I object to this line of questioning for the further reason that it is not proper redirect. It was opened up on direct and was not touched on on cross-examination at all. I would like the records to show that.

The Court: It is not properly redirect.

Mr. Donovan: I would like to submit that it is proper redirect, that we be permitted to proceed. I think it has great materiality as bearing upon the line of question pursued by the Government and by 2512 ourselves as bearing upon this very question of acquiescence and administrative action.

Q. Did Mr. Fahy as chairman of the board, with the concurrence of you and Mr. Swanson send a telegram to Mr. Arnott on May 14, 1935?

Mr. Chaffetz: That is the same telegram that was offered on direct examination and was excluded. The same objection is now made that was made on direct examination.

The Court: If it is, the objection is sustained. Is it the same telegram with reference to Pennsylvania?

Mr. Donovan: This is it (showing paper to the Court.) Your Honor, I only had that marked for identification, and it was not offered at the time.

The Court: My recollection was that it was offered and objection was sustained. Objection is now made to it, and the objection is sustained. Exception allowed.

(Exhibits 915 and 916 for identification were offered in evidence, the same objections made and sustained and exceptions allowed.)

Q. Was the problem presented by the Pennsylvania refiners the same kind of problem, lack of parity and surplus production, that Mr. Arnott had been dealing with by the buying activities in the Mid-Continent?

2513 Mr. Chaffetz: That is objected to.

Mr. Lewin: Objected to on the same grounds.

The Court: Objection sustained. It is rather leading and suggestive also. Exception allowed.

Mr. Donovan: Q. What was the problem in Pennsylvania?

Mr. Lewin: Objected to as incompetent, irrelevant, and immaterial.

The Court: Objection sustained. Exception allowed.

Mr. Donovan: Q. Was it your judgment that the stabilization of the—

Mr. Chaffetz: That is objected to as leading, obviously going to be leading.

The Court: Refrain from asking leading questions.

Mr. Donovan: Q. What was your judgment, if any, as to the stabilization of retail markets being maintained without stabilization of the tank car market?

Mr. Lewin: Objected to as calling for an opinion from this witness that could not have any bearing whatever on the issues, and it is incompetent, irrelevant and immaterial.

Mr. Donovan: I am asking him for his judgment,
2514 as having charge of that.

The Court: How much of an expert is this man in the oil industry?

Mr. Donovan: Well, I will ask him how much of an expert in the oil business—

The Court: Q. Did you ever sell any gasoline?

A. Yes.

Q. Where?

A. At Peoria, Illinois, when I was a child.

Q. Did you ever work in a refinery?

A. No.

Q. Did you ever work in an oil field?

A. I haven't worked for any oil company under any circumstances whatsoever.

Q. Then you have not had any actual experience?

A. I have been a student of the problem for 20 years.

Mr. Chaffetz: I object to the pending question on the ground it is immaterial and irrelevant to the issues in this case.

By Mr. Donovan

I have testified as an expert for the Government more
than once. I testified as an expert witness in the Mills
2515 case before the District Court in Baltimore, and in
the Victor Silverman case in Detroit. The Mills case
was an oil case under the Code.

The Court: Proceed with your questioning. You may answer the question. Put the question.

Q. Did you have any judgment as to the effect—as to whether or not retail markets could be stabilized without maintaining stabilization of tank car markets?

A. Yes, I did have a judgment in such—

Q. What was that judgment?

A. That it was impossible to maintain a normal retail market with a subnormal tank car market. Likewise it would be impossible to maintain a normal tank car market with a very extensive subnormal retail market.

Q. Then as a member of the P. A. B. did you consider the work of the tank car stabilization committee as a useful means of stabilizing the retail situation?

Mr. Chaffetz: I must again object to that question, and also—

The Court: Your objection is sustained. Exception allowed.

I would not consider it unusual for a major company
to be buying in anticipation of its needs at a later date,
such as getting ready for the summer traffic,
2516 even though they might buy beyond the needs of the
moment.

Q. Dr. Frey, do you know how much distress gasoline there was on the market in January and February, 1935?

Mr. Chaffetz: Object to that question, unless he is asked how he knew.

The Court: You may answer it Yes or No. You may answer the question Yes or No. If you know.

A. I know approximately how much was in distress.

The Court: Q. How did you know?

A. From reports.

Q. Reports from where?

A. Reports of the Bureau of Mines and also reports from Mr. Arnott.

Mr. Chaffetz: What reports of the Bureau of Mines does the witness have reference to? Are they published reports?

The Witness: That is just like you get the Bureau of Mines Statements; on the monthly statements, you know.

Mr. Chaffetz: Q. Could we find out how much distress gasoline at any time by looking at the Bureau of Mines reports?

2517 A. You could do this: you could take the East Texas allowable, for instance, and subtract that from the Bureau of Mines, monthly report on East Texas, and that would give you about how much crude there was there in distress; and you can also tell the condition of the stock in the Bureau of Mines report. And then you remember, too, that there were the reports that were made by the committee that Mr. France headed—let's see, what is the name of that—the Program Committee, also had reported and—

Mr. Chaffetz: We are talking about the spring of 1935—how much there was in the spring of 1935?

The Witness: Yes, sir. And then, of course, the Federal Tender Board was in there in March; so that we know from them about how much distress there was down there.

The Court: Q. Have you made a study to determine from the records and reports, to determine how much distress gasoline there was on hand during those months?

A. We tried to keep current on that information.

Q. Well, I am asking you now if you have made a study so that you can testify.

A. Oh, yes, I have made a study of that.

Q. And have you prepared that in writing?

2518 A. No, sir.

Q. Have you got your figures here in writing?

A. No, I do not.

Q. Have you any of the data that you worked out in reaching your conclusion?

A. No, sir. I haven't any data here.

The Court: Well, if this witness has made a study for the purpose of coming here to testify and furnishes Government counsel with reports which he used to arrive at that figure, I think we will take the testimony.

The Witness: I haven't done that, your Honor. You see, I didn't know what I would be asked to testify on, so I haven't made any particular reports for that purpose. I simply am trying to get a background in the situation, have a statistical picture as of that time; and I am only speaking in general terms. I cannot give specific figures, because I don't have them in mind; and I have no data with me to refer to.

Mr. Donovan: I am asking him your Honor, only about January and February.

Mr. Chaffetz: Is that right?

Mr. Donovan: 1935.

Mr. Chaffetz: I think I will withdraw the objection, your Honor.

2519 The Court: You may answer.

A. I can answer in general terms, that there was a very large quantity of distress gasoline on the market—a quantity approximating 600 to 700 carloads a month, in the Mid-Continent, and about that same amount in East Texas. There was also some in Louisiana, but I can't tell you what that amounted to. I know that there was distress gasoline in Louisiana also.

I have stated that Mr. Arnott and his Stabilization Committee reported from time to time to the Petroleum Administrative Board.

Q. Under what provisions of the Code were the stabilization activities carried on?

Mr. Chaffetz: That is objected to. The stabilization activities, apart from the buying program, have nothing to do with this case.

Mr. Lewin: It is an attempt to go back into the same old subject time and time again.

The Court: Objection sustained. Exception allowed.

Q. Can you tell us how the Stabilization Committee obtained compliance with the provisions of the Code?

2520 Mr. Chaffetz: That is objected to as immaterial and irrelevant. It has nothing to do with the issues in this case; and counsel himself made the objection when I asked a similar question this morning, that we would have to go into some other case and deal with something that isn't involved here. I make the same objection that he made.

The Court: Objection sustained. Exception allowed.

Q. I haven't clearly gotten in my mind, Dr. Frey, and I wish you would help me, as to just how this question arose, when Mr. Arnott said that he wasn't asking for any authority at the meeting of March 12th and May 8th. I would like to understand, if you can tell us, just how that arose. I think it was "approval", and not "authority". I will substitute the word "approval" for "authority." Let's deal with March 12, first.

A. I think the question was raised by Mr. Fahy as to whether or not there was any possibility that the buying which was going on was in violation of the anti-trust laws; and Mr. Arnott replied, as I stated the other day, that he didn't believe there was; and then described what they were doing.

Q. Now, is that all that occurred on March 12th?

2521 A. Oh, no, there were many other things that were discussed on March 12th. Mr. Arnott discussed the whole problem of—not the whole problem, rather—but discussed some of the important problems in stabilization at that same meeting.

Q. Was there anything said at that time about approval?

A. Mr. Arnott did not ask for our approval at that meeting.

Q. Did Mr. Arnott point out that there was an informal program?

Mr. Crawford: I think these questions are leading.

The Court: Objection sustained. That is leading. Exception allowed.

On that occasion, there was nothing said one way or the other about our approval. It arose in a very incidental way on May 8th. That was a very warm session. The principal subject was not the buying program. It came up incidentally towards the close of the meeting, in which there were a few remarks exchanged on whether the buying was continuing and whether Mr. Arnott was taking the letter of July 20th as the authority for his work. I think those questions were asked by Mr. Fahy. I would not be certain about that, though.

Mr. Arnott said that he was not relying on the 2522 letter of July 20th, for approval; and that the buying was still on an informal basis; more or less repeating what he had said before. He didn't ask for our approval at that time, either. I think that there were many things talked of, but I think that was the essential—

Q. You say he said that he was going forward on an informal basis. What did you understand by that?

A. I understood that the tank car committee was supplying information as to where distress gasoline was, who had it, and in what quantities, and bringing that to the attention of the companies that were in position to buy, and that companies were buying gasoline. I did not understand that there was any pool; there were no required purchases by any company. It was purely on an informal basis, in which the Tank Car Committee supplied the information, and the major companies acted.

Q. Now, in previous years, more particularly in 1934, had there been what were called formal buying plans?

Mr. Lewin: Objected to as leading, irrelevant and immaterial.

The Court: Objection sustained. Exception allowed.

2523 Mr. Donovan: Q. Was anything said at this meeting of May 8th, one way or the other, about approval or disapproval?

A. Not by us, no.

Q. You say that the meeting opened up rather warmly. How did it end?

A. Well, it ended much better. I mean, there was a good deal of heat at the beginning of the meeting. Mr. Arnott came in a rather rebellious frame of mind. He thought that we had double-crossed him by dealing with a man by the name of Blackwell, I think it was—Blackhawk or Blackwell—without first giving him some information on what we had been doing, so he came in prepared to tear up the place, and proceeded to do it for a considerable length of time. There were some very hot exchanges between Mr. Fahy and Mr. Arnott at that meeting, both of whom, I think, said things that would have been better left unsaid. But after we got to understand each other, things calmed down, and we decided on how we would proceed.

This group of Mr. Arnott considered that our requests in the letter of April 22nd were just impossible. They couldn't have someone present. There were many thing that they objected to. We decided at the end of that meeting to have one of our men 2524 from Chicago, Mr. Moore and Mr. Shaughnessy, the attorney, work with Mr. Majewski, who had come with Mr. Arnott on that occasion.

The Court: You may confine yourself to what was said about what related to buying programs. Confine your answer to what was said by Mr. Arnott and Mr. Fahy and yourself about the buying programs.

A. Then at the close just before this meeting broke up, the remarks which I have previously made, Mr. Arnott's statement concerning the buying program were made.

The Court: Just what was that statement?

A. That they were continuing to buy informally, that there wasn't any pool, that no one had to make the purchases, there was nothing obligatory about it, but they were working toward lifting from the independent refiners this distress gasoline which was burdening the market. Those are not the exact words.

Recross Examination by Mr. Chaffetz.

Q. Dr. Frey, on your redirect examination, did you intend to change any of your testimony on cross-examination in response to questions that I asked?

A. No.

2525 Q. You are thoroughly conscious of all your answers you gave to me, are you?

Mr. Donovan: I object to that question, your Honor. That is argument before the jury.

Mr. Chaffetz: I want to make sure.

The Court: Objection overruled. Exception allowed. You remember your testimony, don't you, both direct and cross-examination, don't you?

A. Well, I suppose I—

The Court: All right, go ahead.

Mr. Chaffetz: Q. Didn't I ask you and didn't you tell me in your cross-examination this, that you recalled that it was definitely stated to Mr. Arnott in your presence that the letter of July 20th gave him no authority, that he had no authority under the

Code with reference to buying programs? Do you remember giving that testimony?

A. Yes. I don't think I have changed that any.

Q. And you don't want to change that any?

A. No.

Q. All right.

A. I have said right along, Mr. Chaffetz, that Mr. Arnott didn't ask our authority.

Q. And I asked you and didn't you answer in
2526 fact what I just said to you in your own words?

A. Yes.

Q. Yes. And then I asked you and you told me that he said that they were acting on their own responsibility?

A. Yes.

Q. And on the advice of their own lawyers?

Mr. Donovan: There was no such—that isn't my recollection, your Honor, as to any such question. What page is that?

Mr. Chaffetz: I have the testimony before me.

Mr. Arnott: —

Mr. Donovan: What page?

Mr. Chaffetz: Page 1302.

> Q. (Reading.) "Q. At the March 12 meeting, didn't Mr. Arnott state in his own words that what he was doing with respect to buying, he was doing on his own responsibility?
>
> "A. I have always answered that the same way—
>
> "The Court: Well, answer it now.
>
> "A. —that Mr. Arnott did not ask our authority for the buying program, and that he was doing it on his own responsibility.
>
> "Mr. Donovan: Q. Is that what he said, or did you characterize it—
>
> 2527 "A. That is a characterization. It is not an exact statement. I don't remember exactly what the words were that Mr. Arnott used.
>
> "Mr. Chaffetz: Q. It is a characterization of what Mr. Arnott said?
>
> "A. That is right."

A. Yes.

Q. You don't want to change that testimony?

A. No, sir.

Mr. Chaffetz: That is all.

The Court: That is all.

Mr. Donovan: Now, your Honor, on the question of the authority of the Petroleum Administrative Board, and particularly of Dr. Frey, we have never contended that this Board had the authority to do what only the President of the United States had to do. But we do contend that they had the power of approval, such as was exercised, both in the Steel case and in the Hawaiian case, which I presented to your Honor, and which Mr. Wood made more argument about.

Now, let's deal directly with this question of what authority this Board had. There have been a lot of words bandied about concerning that; now let us get the fact.

I have in my hand now, your Honor, a certified copy by the Secretary of the Interior himself, Mr. 2528 Ickes, which was signed yesterday, which gives here the classification of authority of these members of this Board, and delegates, on their classification sheet, the specific power and authority that they had. And, in view of the question raised by Mr. Lewin, I now offer that certification of their powers and their authority and their duties in evidence. I ask to have it first marked for identification.

(Document referred to is marked Exhibit 974 for identification.)

Mr. Donovan: Now, I offer that in evidence, your Honor; and I direct your Honor's attention particularly to the definition of duties of Dr. Frey.

(Handing exhibit to the Court.)

Our contention here is not—we are not talking about the kind of approval that they are talking about.

We say this: That these men, under the definition of their powers and duties and authority in these classification sheets, which the Secretary of the Interior himself has certified, gave them the power to deal with this subject matter, and to encourage or prevent. And we are entitled to offer that proof.

2529 Mr. Lewin: Your Honor, the only kind of approval that ought to be talked about in this case—and I am glad to hear counsel say that he is not talking about the kind of approval that the Government is talking about. The only kind of approval in this case to be talked about, I submit, is legal approval; that kind of approval that would have some effect; upon which intelligent, smart men like

Mr. Arnott would be entitled to rely. Not on what he says he imagined he had, but on what he had. That is the only kind of approval that ought to be considered in this case.

And why is that? I suggest to your Honor, why is that?

If, by walking into minor officials' offices in Washington—and there are hundreds of them, maybe thousands of them, of the same dignity as Dr. Frey and Mr. Fahy; Washington is full of them, of public officials that have the same sort of thing—perhaps as Special Assistants to the Attorney General, for instance. Suppose you could walk into those offices and talk over great big problems like this in a more or less half-baked way, and get a more or less acquiescence or good-will toward what you were doing, 2530 which might be based on all kinds of assumptions, and that could be the equivalent of an approval of the President of the United States, established by Congress—just think where the law of the country would be.

It would be a complete suspension of all the statutes and of all the law, if all we had in the government in this United States, in order to do anything we pleased as against jobbers or in favor of independent refiners or anybody else, was to get on the train and go down and find some subordinate official in Washington, who would listen to your tale of woe and pat you on the back, perhaps, or anything else, and say, "Fine, old fellow, go to it." If that was the law, then we might just as well repeal all the statutes. That would be a Government of men—not of responsible men; not of high officials, not even of that dignity; but a Government of thousands of subordinate office holders. That is what our Government would come to, if they can go in there and chat with these minor officials and come out of there with approval which is the equivalent of what the law says, Presidential approval, then law is gone.

2531 There are two documents there that relate to Frey. One has some bearing about his duties. It is signed by Nathan Margold, the Solicitor of the Department of the Interior; and it is approved by Harold L. Ickes. Now that is one short sheet in there. And that shows the duties of Dr. Frey.

Plus another document, which is the order of the

Secretary appointing the Petroleum Administrative Board itself.

Now, those two documents, and those two documents only, I submit to your Honor, are the expression of Frey's authority; first, the document appointing the Board, which is to advise and make recommendations, and to do certain administrative duties that may be delegated to it—administrative duties that may be delegated to it by the Administrator. That is the first authority: No authority on the part of this Board can rise about that document. And the second document that is pertinent is the one I am telling you about, that is signed by Nathan Margold and approved by the Secretary.

Now, in addition to that—in addition to that you will find a document that is well known in Washington. It is a write-up of a lot of detail, of various functions that a man does come in contact with. And
2532 it is a salary write-up. It is to justify a certain classification of salary, and it isn't approved by any Secretary of the Interior; it never gets to any such official as that.

It is written up, down in the subordinate offices, and it goes into your personnel file as an outline of the various things that you consider. And of course, it is to your credit, the more that you can pack in there about things you can consider, the more authority that you feel you have, and can swell your chest out about, and all the rest of it. And it is the justification for your salary; that is what it is.

Mr. Francis: Certainly in view of those remarks, your Honor, we will let the Exhibit go to the jury, in view of counsel's misinterpretation.

Mr. Donovan: I understand that Exhibit Number 974 is received in evidence.

The Court: Exhibit 974 will be received.

(Document received in evidence as EXHIBIT 974, and read to the jury by Mr. Donovan.)

Mr. Donovan: There has been received in evidence a certification by Mr. Ickes of the power and authority of the various members of the P. A. B. Board with the exception, which I didn't have at the
2533 time, of Mr. Fahy; and I will now offer that, which is Exhibit 988.

(Document referred to is received in evidence as EXHIBIT 988, and read to the jury by Mr. Donovan.)

Mr. Thomas: Exhibit 996 for identification is an uncertified document, your Honor, being a telegram to R. R. Irvine, one of the attorneys for the defense, from Harold L. Ickes, Secretary of the Interior, and unless certification is insisted on by the Government, I would like to offer it for the purpose of showing allocation of positions to salary grades on job sheets, the action of the Secretary of the Interior taken and the date the action was taken.

(Document referred to is received in evidence as EXHIBIT 996 and read to the jury.)

2534 STEWART M. VOCKEL, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Pittsburgh, Pennsylvania. I have been president of Waverly Oil Works Company since May, 1932. I look after financial matters, make contacts for business purposes, and have something to do with the purchase of crude oil.

George E. Willey is vice president in charge of sales of Waverly Oil Works Company, and William H. Millhiser is purchasing agent and vice president in charge of refining operations.

The business of Waverly Oil Works Company since 1880 has been refining. Our company does not own its own producing wells. We purchase all our crude oil.

It is a very small independent refinery, having no connection with any major companies in any manner. We are below the average size refinery in Pennsylvania.

Right now we have monthly production of 45,000 barrels. In the spring of 1935, we were running about 24,000 barrels per month. We use Pennsylvania grade crude oil. We get somewhere around 10 gallons of lubricating oil out of a barrel of our Pennsylvania crude. A barrel is 42 gallons.

The principal products of our company are cylinder
2535 stocks, neutrals and bright stocks. Gasolines and kerosenes are more or less by-products.

On April 8, 1935, we had a conference with the Petroleum Administrative Board.

Q. Did you personally arrange for that conference?

Mr. Lewin: Your Honor, we object. It is purely killing time and it can't have any—

Mr. Donovan: I object to any such statement, "purely killing time."

Mr. Lewin: We haven't—we feel—

Mr. Donovan: No matter how he feels, I ask that the jury be instructed to disregard it. Mr. Lewin is making too many of those statements.

The Court: Just a minute. The jury may disregard that remark. Is this leading up to the matter that was referred to in those telegrams?

Mr. Donovan: Yes, your Honor.

The Court: I think we are wasting time, then. Go ahead and ask your question.

Mr. Donovan: Well, now, your Honor, I don't think your Honor should make—

The Court: I don't care what you think. Those telegrams are immaterial.

Mr. Donovan: Now, your Honor, I don't think any such statement should be made in relation to
2536 my offer before this jury.

The Court: I will say it again. I think it is immaterial.

Mr. Donovan: And then I object, your Honor, also, to the statement of your Honor's that it is any waste of time. I don't think it is a thing your Honor should do. I don't think it is fair to me or these defendants.

The Court: I don't care what you think or anyone else thinks. I made the statement, and the statement will stand. Proceed with the case.

Mr. Donovan: I take an exception.

The Court: I am telling you now that it is immaterial and irrelevant and has no basis in this case. No more discussion.

Mr. Donovan: I have a right to make a statement, and your Honor must permit me to do it. I objected to your Honor's statement that it is a waste of time, and I think your Honor must recognize that it is an unfair thing to say in relation to me as an officer of this Court and unfair to these defendants, when I have stated frankly to your Honor as to what I desired to prove.

Mr. Chaffetz: May I say a word—

The Court: I am saying to you it is immaterial and irrelevant and we shouldn't waste time with it.

2537 Mr. Chaffetz: I just want to say this, your Honor—

The Court: What do you want to say?

Mr. Chaffetz: This particular proof was proffered twice already, and your Honor has said that counsel may make offer of proof, and I understand counsel has reserved the right to make that offer of proof.

Mr. Donovan: Does your Honor rule on that?

The Court: Yes. I have seen the telegrams and read them, and I don't think they are relevant and material, and when they were objected to, I sustained the objection. I don't think we should waste any more time with them. You can make your offer of proof, if you wish.

Mr. Donovan: Now, your Honor, I think in view of the statement of the Court to me in relation to what has been said about the waste of time, I am with great reluctance forced to ask for the withdrawal of a juror, and a continuance of this case.

The Court: Oh, motion is denied.

Mr. Donovan: I take exception.

The Court: You may have your exception; proceed.

Mr. Donovan: Now, I understand, your Honor, that the evidence that I attempted to adduce from 2538 the testimony of this witness is to be made as an offer of proof, and it would be unnecessary for me to ask any more questions of this witness.

Mr. Crawford: I don't think the Court should be bound by any such statement.

The Court: I asked counsel if it referred to the subject matter of those telegrams, and he said, "yes", and I say now it is irrelevant and immaterial and has no bearing on the case at all. If you want to, you may submit that proof in writing without any more discussion on it.

Mr. Donovan: Well, I will make submission of offer of proof, your Honor, and this witness may step down.

The Court: You may step down.

(The following preceedings were had in the absence of the jury.)

Mr. Donovan: I first make an offer of proof in regard to the testimony of Stewart M. Vockel. This offer of proof is made by reason of the fact that the Court has sustained the objection to any line of testimony relating, First, to the situation of the independent refiners of Pennsylvania in April, 1935; and

Second, the conference between S. M. Vockel, G. E. Willey, and the Petroleum Administrative Board on April 8, 1935; and 2539

Third, conferences between S. M. Vockel, G. E. Willey and the Petroleum Administrative Board on May 13 and 14, 1935; and

Fourth, correspondence by the Petroleum Administrative Board relative to the above subjects during April and May, 1935.

And I am sure your Honor will permit it to be understood that proper questions will be asked as to each sentence and statement set forth in the offer of proof which I make in question and answer form.

If allowed to testify, the witness would testify as follows:

> "I am Stewart M. Vockel, president of the Waverly Oil Works Company, Pittsburgh, Pennsylvania. I have been president since May, 1932. I am chief executive of the company, make the necessary contacts, handle financial matters, and generally run the business. The other officers of the company are G. E. Willey, vice president in charge of sales, and W. H. Millhiser, vice president in charge of refinery operations and also chief engineer and purchasing agent for the company."
>
> "The Waverly Oil Works Company is in the refinery business. It has been in that business for 57 years, having been established in 1880. 2540 It has continually operated except for a short time during the flood in the spring of 1936. The Waverly Oil Works Company does not own its own producing wells, but purchases all its crude oil. It is a very small refinery; it is below the average size refinery in Pennsylvania. The Waverly Oil Works Company has always been an independent company. Its only connection with a major company is that it sells a sizable amount of its products to major companies. The operating capacity of the refinery is now 35,000 barrels a month. During the year 1935 it ran approximately 24,000 barrels of crude oil per month through

its stills. The only kind of crude oil it uses is Pennsylvania grade crude oil. It obtains about 10 gallons of lubricating oils out of every barrel of Pennsylvania grade crude oil. Pennsylvania grade crude oil contains about 10 times as much lubricating oil per barrel as Mid-Continent 36 gravity crude oil.

"The principal products of the Waverly Oil Works Company are lubricants. Its main products are cylinder stocks and neutral oils. It makes kerosene and gasoline, but these are considered merely by-products. Pennsylvania gasoline is of low octane value and is manufactured merely in the process of making lubricants.

2541 "On April 2, 1935, I telephoned the Petroleum Administrative Board in Washington and told someone I wanted to talk about the price of Pennsylvania grade crude oil. I was put in contact with Mr. E. B. Swanson, a member of the Board. I told him that our company was having difficulty in Pennsylvania because of the price of crude oil. He suggested that I come to Washington to confer with the Board. He suggested a conference at ten o'clock Monday morning, April 8, 1935. On the same date I sent him a confirming letter regarding the proposed conference. On April 2, 1935, I wanted to see the Petroleum Administrative Board as soon as possible. My reason was that the Blazer Committee report had just been released and had pointed out vividly the difficulties of the small independent refiners in Pennsylvania. It showed that Pennsylvania refiners were losing 32¢ on each barrel of crude oil refined. I wanted to use this report as an argument to show why the Petroleum Administrative Board should help the small Pennsylvania refiners. April 8th was the first date that a conference could be arranged.

"On April 8, 1935, Mr. G. E. Willey, our vice president, and I had a conference with the Petroleum Administrative Board in Washington. The conference lasted about two hours. 2542 The persons present on behalf of the Petroleum Administrative Board were Mr. Charles

Fahy, the chairman, Mr. E. B. Swanson, a member of the Board who, we understood, was in charge of production and refining, and Mr. Ben Lindsey, a geologist who was familiar with the general situation in Pennsylvania.

"At this conference I told the Petroleum Administrative Board that our company secured Pennsylvania grade crude oil in the southwestern district of Pennsylvania. I said that at that time we were having to pay $2.02 a barrel for such crude oil. I pointed out that there had been two recent rises in the price of Pennsylvania grade crude oil. The first rise was on January 4, 1935, when the price rose 15¢ from $1.72 to $1.87. The second rise was on February 4, 1935, when the price rose another 15¢ from $1.87 to $2.02 per barrel.

"I told the Petroleum Administrative Board that we could see no justification for the 30¢ rise in the price of crude oil. I said that at this time the market prices for finished products were decidedly weak and that the prices for finished products had been dropping month by month. By finished products I mean cylinder stocks and neutral oils. I pointed out to the Petroleum Administrative Board that 2543 the 30¢ crude price rise in Pennsylvania was hurting the small Pennsylvania refiner because he could not get back enough to recover his costs when he sold his finished products. I pointed out that the prices for finished products were below normal prices in relation to the price of crude oil. My recollection is that I mentioned the gasoline price then existing. I explained to the Petroleum Administrative Board that we were not interested in gasoline because it was merely one of our by-products in Pennsylvania.

"The Petroleum Administrative Board recognized that the prices we were receiving for our finished products were too low in relation to the price we were having to pay for crude oil in Pennsylvania.

"I asked the Petroleum Administrative Board to take steps to cancel the 30¢ price rise for crude in Pennsylvania. The persons pres-

ent on the Board at this conference were evasive to my request. I also told the Petroleum Administrative Board that we were losing money because of the price of crude oil and the prices of refined products. I pointed out that there were 10 or 15 people in the refining and marketing end of the oil business in Pennsylvania, compared to one in the producing end. I said that unless something was done about the price situation in Pennsylvania many
2544 people would be thrown out of work. I specifically told the Board that we had men in our refinery who had been working over 40 years and knew no other line of work if we had to shut down our plant.

"The Petroleum Administrative Board, through Mr. Swanson, told us that the Stabilization Committee of the Planning and Coordination Committee was doing a very useful and constructive job in stabilizing the refinery gasoline market in the southwestern states. They said that they expected that this Stabilization Committee work would continue and that there would be further rises in the price of refinery gasoline in the Mid-Continent area. They said that the effect of this stabilization work and these price rises would soon be reflected through the entire industry. They said that within 30 days they expected that this fine work of the Stabilization Committee in the Mid-Continent area would cause prices for refined products in Pennsylvania to rise. They said that the Stabilization Committee work was helping the refiners and others in the Midwestern states.

"The Petroleum Administrative Board did not state whether the Stabilization Committee had authority to handle matters pertaining to the gasoline refinery market in the Midwestern
2545 area. However, they made some statement that gives me the present impression, I cannot recall what it was, that the Petroleum Administrative Board was backing the Stabilization Committee work in the Mid-Continent area.

"I said that we would wait 30 days to see whether we in Pennsylvania would be benefited by the work of the Stabilization Committee in the southwestern states in connection with refinery gasoline markets. The Petroleum Administrative Board told us that if our situation in Pennsylvania had not improved within 30 days to come back and they would again consider our problem.

"On May 7, I received the following letter from E. B. Swanson, for the Board."

(Exhibit 972 for identification was here read in full into this offer of proof by Mr. Donovan.)

"By the statements contained in the second paragraph of Mr. Swanson's letter I understood him to mean that under the Petroleum Code the Stabilization Committee in the Midwestern area was removing the difficulties or forces which were holding down refinery prices for gasoline in the Mid-Continent area. Mr. Swanson at our conference on April 8, 1935, had said that during the next several weeks the price of refinery gasoline in the Mid-Continent area would be brought more in line with the price of Mid-Continent crude oil, due to the useful and constructive work of the Stabilization Committee in the Mid-Continent area.

2546

"On May 8, 1935, I sent the following letter to Mr. E. B. Swanson of the Petroleum Administrative Board."

This letter is dated May 8, 1935, addressed to Honorable E. B. Swanson, Member, Petroleum Administrative Board, U. S. Department of the Interior, Washington, D. C.:

"Dear Mr. Swanson:

Thank you for your letter of May 7th. If we were operating on Mid-Continent crude I would agree with the premises as expressed in your letter. With the present quotations on United States Motor Gasoline and with Mid-Continent Crude selling at $1.00 per barrel you are correct. However, Pennsylvania crude is valued at twice that of Mid-Continent, but unfortunately with the same prices ruling on the finished products as far as light ends are concerned, you can see the predicament of the Pennsylvania refiners. It is with this thought in mind and the seriousness of our situation that I would like very much to

see you either Monday or Tuesday of next week.
2547 As advised you by telephone yesterday, I will wire you Friday as to the day I will be in Washington and trust it will be convenient for you to see me some time during that day.

"Thanking you, I beg to remain,

"Yours very truly,

"Waverly Oil Works Company,

"President."

"I used the words 'Mid-Continent crude' in that letter because I believed that Mr. Swanson was trying to inform us that our situation was improved because of the accomplishments of the Stabilization Committee in the Mid-Continent area in connection with refinery gasoline prices. I wanted to point out to him that our situation had not improved as he had predicted. I wanted to arrange for another conference.

"On May 13, 1935, Mr. G. E. Willey and I had another conference with the Petroleum Administrative Board. Those present on behalf of the Board at this conference were Mr. Charles Fahy, the Chairman, and Messrs. E. B. Swanson and John W. Frey, members of the Board. The other members of the Board, Messrs. Norman Meyers and J. Howard Marshall, were out of town at that time. This conference lasted about 15 minutes.

2548 "I brought to the attention of the Board the then existing condition of the Waverly Oil Works Company. I told the Board that the conditions in Pennsylvania had not improved. I said that the prices of our refined products had not risen. I said that the Stabilization Committee work in the Mid-Continent area had not been reflected back into Pennsylvania as the Board had predicted at the conference on April 8, 1935. I again asked that the Board take steps to cause the price of crude oil in Pennsylvania to be reduced 30¢ a barrel.

"The Petroleum Administrative Board said that we would have to be patient for a few weeks more. They said nothing could be done by the Board to cause the price of crude oil in Pennsylvania to be reduced. Nothing was accomplished at the conference.

"Mr. Willey and I then went back to the hotel

in Washington at which we were staying. We sat up until 3 o'clock in the morning trying to determine whether or not we would close our refinery which had been operating for 57 years. We decided to ask our Senator to intercede for us with the Petroleum Administrative Board. The next morning I went to see Senator Davis of Pennsylvania, who was a friend of mine. He was ill. I talked with his executive assistant, Mr. Boal. Mr. Boal telephoned the Petroleum Ad-
2549 ministrative Board in my presence and asked that something be done to help the small Pennsylvania refiners, particularly the Waverly Oil Works Company.

"When I got back to the hotel Mr. Swanson phoned us and arranged for a conference at 12 o'clock on May 14, 1935. At 12 o'clock, May 14, 1935, Mr. Willey and I again went to see the Petroleum Administrative Board. Mr. Fahy and Mr. Swanson were present at that conference. I do not recall whether Dr. Frey was present. The conference lasted about 5 or 10 minutes.

"Mr. Fahy said that they had been considering our situation. He said that the Board felt that it had arrived at a plan which would help us. They read to us a telegram they had sent, or were about to send, to Mr. C. E. Arnott, at Tulsa, Oklahoma. The telegram that they read to us is as follows:

(Exhibit 916 for identification was here read in full into this offer of proof by Mr. Donovan.)

"This was the first time that the Petroleum Administrative Board had mentioned Mr. Arnott's name at any of our conferences. I had heard of Mr. Arnott for many years. I read the trade journals and knew that he was head of the Stabilization Committee. Upon hearing
2550 the telegram from Mr. Fahy to Mr. Arnott, I realized for the first time that Mr. Arnott was in charge of the Stabilization Committee work which was going on in connection with the refinery gasoline market in the southwestern States. I knew of this Stabilization Committee work in connection with refinery gasoline markets in the southwestern states because of the statements by the Petroleum Administrative Board at our conference on April 8, 1935.

"The members of the Petroleum Administrative Board on May 14 did not state what they thought Mr. Arnott could do to help the Pennsylvania refiners. They made some comments along the line that the Petroleum Administrative Board had gotten in back of our problem and would help us out. They did not state that Mr. Arnott had the authority to deal in only local price situations in the retail and tank wagon markets. They did not state that Mr. Arnott had no authority to handle matters in connection with tank car refinery markets.

"I did not understand, nor did the Petroleum Administrative Board state at the conference on May 14, that the telegram to Mr. Arnott meant that he was to come into Pennsylvania to cause the price of crude oil to drop. I understood that Mr. Arnott and the Stabilization Committee had 2551 authority under the telegram to take whatever steps were being taken in the Mid-Continent area, to bring about a more normal relation between the price of crude oil in Pennsylvania and the price the refiners were receiving for their finished products.

"Neither Mr. Willey nor I at any time suggested to the Petroleum Administrative Board that Mr. Arnott or the Stabilization Committee go into Pennsylvania and start a buying program of Pennsylvania lubricants. The Board indicated, however, that Mr. Arnott and the Stabilization Committee would do for the refiners in Pennsylvania regarding their lubricants what was being done for the independent refiners in the Mid-Continent area regarding their gasoline.

"I know that Mr. Arnott replied to the telegram of May 14, 1935. Soon after the Petroleum Code was declared invalid on May 27, 1935, I was in the office of Senator Davis of Pennsylvania. Mr. Boal showed me a letter, dated May 17, 1935, which Senator Davis had received from Mr. E. B. Swanson on behalf of the Petroleum Administrative Board. I read this letter. Mr. Boal let me make a copy of it, which I have. The letter contains a reply by Mr. Arnott to the telegram of May 14, 1935. The letter of May 17,

1935, from Mr. Swanson to Senator Davis reads
2552 as follows:

(Exhibit 973 for identification was here read in full into this offer of proof by Mr. Donovan.)

"After the conferences on May 13 and 14 I went back to Pittsburgh. I kept in touch with the Petroleum Administrative Board by letter and telephone.

"On Friday, May 24, 1935, I telephoned Mr. Swanson in Washington. I told him that we were still having difficulty in Pennsylvania because the price of crude oil had been cut only 10¢ a barrel. I asked him whether the Board had received any reply to the telegram that they read to us at our conference on May 14, 1935, which was addressed to Mr. C. E. Arnott. Mr. Swanson told me that a reply had been received. He said that the reply stated that Mr. Arnott and his Stabilization Committee would get to work in Pennsylvania very shortly. He said that the matter of the Pennsylvania refiners would soon be taken care of by the Stabilization Committee.

"I do not know whether Mr. Arnott or the Stabilization Committee in fact took any steps to help out the situation of the small Pennsylvania refiners. The Petroleum Code was declared invalid on May 27, 1935. There was not much time to help us in Pennsylvania.

"I do not recall a conference that Mr. Arnott
2553 called in New York on May 28, 1935, for the purpose of considering the difficulties of the Pennsylvania refiners. I was not invited to any such conference. The Waverly Oil Works Company did not go out of business after the Code was over. Prices became more in line soon after the Petroleum Code was declared invalid. Our company was able to remain in business."

Mr. Chaffetz: Is that all of that offer?

Mr. Donovan: Yes.

Mr. Chaffetz: That is objected to, on the grounds we have previously stated.

The Court: Objection sustained. Exception allowed.

2554 **W. J. BRUNDRED**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Oil City, Pennsylvania. I am 55. I am an independent oil producer and have been since 1904. I produce oil principally in western Pennsylvania and a very little in Kansas.

I am vice-president of the Central Pennsylvania Oil Producers' Association, with a membership in excess of 700. I am a director of the Pennsylvania Grade Crude Oil Association, which is an association of producers and refiners and marketers that deal in Pennsylvania grade oil. And I am a director and past vice-president of the Independent Petroleum Association of America.

Q. Will you tell us whether you imparted any information to the Petroleum Administrative Board from time to time as to the conditions of the oil industry in Pennsylvania during the years 1934 and 1935?

Mr. Lewin: I object. Incompetent, irrelevant and immaterial.

The Court: Objection sustained. Exception allowed.

2555 Mr. Donovan: Now, your Honor, without pressing the witness any further, I desire to make offer of proof—

The Court: You may.

Mr. Donovan: —in regard to the testimony we would submit from him. Your Honor, since these witnesses would like to leave town, I would like to make that offer of proof now.

The Court: All right; the jury may retire.

(Thereupon, the jury retired from the court room, and the following proceedings were had in the absence of the jury:)

Mr. Donovan: Here is the statement of Mr. Brundred. This is in question and answer form, and I make this as an offer of proof (reading offer of proof:)

"Q. Mr. Brundred, I show you a photostatic document certified by the Department of the Interior as being a true copy of a letter dated May 9, 1935, signed by you and addressed to

Charles Fahy, chairman of the Petroleum Administrative Board, and ask you whether you wrote and sent the original of this letter to Mr. Fahy?

"A. Yes, I did. I have the carbon copy of the letter with me.

2556 "Q. I show you a photostatic document certified by the Department of the Interior as being a true copy of the duplicate original of a letter dated May 18, 1935, signed by Mr. E. B. Swanson for the Petroleum Administrative Board, and as being sent to you and ask you whether you recall receiving the original of this letter?

"A. Yes, I do. I have the original letter with me."

Mr. Donovan: I would like to have this marked for identification.

(Letter referred to marked Exhibit 925 for identification.)

Mr. Donovan: Also the reply letter dated May 18, 1935, from Mr. E. B. Swanson to W. J. Brundred. That is marked Exhibit 915. I think your Honor has read that letter, so I won't read it now.

(Continuing reading offer of proof:)

"Q. Mr. Brundred, in the letter of May 18th signed by Mr. Swanson for the Board, it is stated that Mr. Fahy telegraphed Mr. Arnott, who replied that he would take the matter up and thought some good could be accomplished for the Pennsylvania refiners and others. It

2557 also states that as a result of the conference with Messrs. Vockel and Willey of the Waverly Oil Works Company, it was 'felt that the Stabilization Committee of the Planning and Coordination Committee which is under the chairmanship of Mr. C. E. Arnott might be of definite assistance in connection with lubricants as they have been in connection with gasoline.' We want to know what the P. A. B. wanted done by the Stabilization Committee in Pennsylvania. Do you know whether the difficulties in the oil business existing in Pennsylvania were known to the Petroleum Administrative Board before May 14, 1935?

"A. Yes. I think the P. A. B. knew all about our situation before that time.

"Q. Will you tell us whether you imparted any information to the Petroleum Administrative Board from time to time as to the conditions in the oil industry in Pennsylvania during the years 1934 and 1935?

"A. Yes, I did.

"Q. How did you impart such information to the P. A. B.?

2558 "A. By personal conference and by letters.

"Q. During the period I have mentioned how often did you have conferences with the members of the P. A. B. relative to the conditions existing in Pennsylvania?

"A. Every time I went to Washington I believe I dropped in at the P. A. B. and talked with one of its members; usually I saw Mr. Swanson or Mr. Fahy.

"Q. Do you recall whether at most of these conferences you discussed the situation in Pennsylvania?

"A. Yes, I did.

"Q. I wonder if you can recall what letters you wrote to the P. A. B.?

"A. I wrote quite a number of letters to the P. A. B. I recall that on June 19, 1934 I wrote to the P. A. B. in which I enclosed a copy of a speech I had made before the Pennsylvania Crude Oil Association at Pennsylvania State College. In this speech I described the condition of the small Pennsylvania producer and of the refiner in Pennsylvania. The P. A. B. acknowledged this letter on June 29. 2559 Apparently they were interested in the facts and statements that I had made. Most of the speech related to the economic situation which existed in Pennsylvania.

"I also recall writing letters to the P. A. B. on August 29, 1934, and on January 18, 1935. In these letters I discussed the overproduction of crude oil in Pennsylvania and how the increased volume of lubricants manufactured from this oil was demoralizing the refinery lubricant market in Pennsylvania.

"I recall that on October 4, 1934, I gave the P. A. B. a very detailed picture of the cost of producing in Pennsylvania, and from time to time I informed the members of the board of the difficulties of both the small producer and the small refiners in Pennsylvania.

"Q. Mr. Brundred, in the letter of May 9, which you wrote to Mr. Fahy, I notice that you stated that there was a meeting in Pittsburgh at which Mr. Shaughnessy was in attendance. Can you tell us who Mr. Shaughnessy was at that time?

2560 "A. Mr. Shaughnessy was at that time a lawyer with the Petroleum Administrative Board.

"Q. When was this meeting held?

"A. February 1, 1935.

"Q. Was Mr. Shaughnessy invited to the meeting?

"A. Yes, we had written to Mr. Fahy, the Chairman of the P. A. B., and told him we were having a meeting and wanted an attorney from the P. A. B. there so that he could advise us as to a supplemental code in Pennsylvania as we wanted to control overproduction in Pennsylvania. Mr. Shaughnessy was sent to help us.

"Q. Mr. Shaughnessy then attended that meeting as a representative of the P. A. B.?

"A. Yes. He was there to learn our troubles and by taking them back to the P. A. B. see what could be done to help us.

"Q. How many persons were present at that meeting?

"A. About 30 Pennsylvania producers. Some producers were also refiners.

"Q. At that meeting when Mr. Shaughnessy
2561 was present, were the difficulties of the Pennsylvania producers and refiners discussed?

"A. Yes, there was an extensive discussion.

"Q. Now, so far as prices for Pennsylvania grade crude are concerned, what facts were brought out at the meeting when Mr. Shaughnessy was present?

"A. The need of restoring a better price for Pennsylvania grade crude oil was the principal subject discussed. My best recollection is that it was pointed out that the crude oil price had risen from $1.72 per barrel to $1.87 per barrel on January 4, 1935. That was an advance of 15¢. These were the posted prices of the South Penn Oil Company for crude oil in Southwestern Pennsylvania.

"Q. You mentioned that the price of Pennsylvania crude oil rose to $1.87 on January 4, 1935. How does this compare with the average price of Pennsylvania crude oil over a period of time?

"A. It was low and the Pennsylvania refiners had a hard time. For the 12 years from 2562 1918 to 1929 inclusive, the average price of Pennsylvania grade crude was $3.80 a barrel, and extending the period to include 1932, was $3.46 per barrel, so you can see that the $1.87 price was far below the usual price.

"Q. What facts were brought out at this meeting as to the better prices for crude?

"A. It was pointed out that we are in a completely stripper well area. Of our 80,000 stripper wells in Pennsylvania, the average production is slightly over one-half barrel a day. It costs a lot to produce crude in Pennsylvania. The fact that we get 85,000 barrels a day of Pennsylvania grade crude and supply 20% of the nation's lubricants was also mentioned.

"Q. Let me get this clear; do you mean that you Pennsylvania refiners get more lubricating oil from a barrel of crude oil than the refiners in the Mid-Continent area?

"A. Yes, it has been generally estimated that the Pennsylvania refiner gets about 9.9 gallons of lubricating oil from a barrel of crude, 2563 while in the Mid-Continent area, the amount of lubricating oil per barrel of crude is about .95 gallons. In other words, we get about 9 or 10 times more lubricating oil than the Mid-Continent refiners do.

"Q. Were the prices of refined products also brought out at the meeting?

"A. My recollection is that they were.

"Q. What were those prices for refined products at that time?

"A. At that time prices for cylinder stocks were going down. Thus, on February 1, 1935 the price of 600 steamed refined cylinder stock was 8¢ a gallon. It had gone down from 16¢ on July 1, 1934. At the same time the price of Pennsylvania neutral oils was going down. On February 1, 1935, the price of 25 pour-test 200 neutral oil was 28¢ a gallon. On July 1, 1934, it was 29½¢ a gallon. On February 1, 1935, the price of 25 pour-test Bright Stock was 15½¢ a gallon. On July 1, 1934, it was 26¢ a gallon.

"Q. What about the price of Pennsylvania gasoline?

"A. We were not worrying about that.
2564 In Pennsylvania, gasoline isn't our principal product. It has a very low octane. It is considered a by-product. We usually can dispose of it without trouble. We get most of our recovery from bright stock, neutral oils, cylinder stock and lubricating oils. They are our 'money crop.' Gasoline is a by-product with most of the Pennsylvania refiners.

"Q. At the meeting in Pittsburgh which Mr. Shaughnessy attended, was there any discussion as to the amount of crude oil being produced and the amount of oil being refined?

"A. Yes. It was pointed out that the crude production allocations to Pennsylvania producers had been gradually increased and were too high. Too much crude was being run through stills. At the meeting, it was agreed that the Pennsylvania refiners were producing too much crude oil and were running too much oil to stills. Later, a committee of seven producers was appointed to confer with seven representatives of refiners to see if the situation could be remedied.

2565 "Q. At the meeting which Mr. Shaughnessy attended, was anything said about the amount of inventories in the hands of small Pennsylvania refiners?

"A. Yes. I can't recall who said it, or the exact words, but I recall that it was brought out at the meeting that both the major companies and the independents agreed that there were top-heavy inventories which had been accumulating for some time past, and that these inventories were demoralizing not only to the

Pennsylvania crude lubricating market, but also the national lubricating markets as well.

"Q. So that what you say will be perfectly clear, will you tell us whether there is any relation between the Pennsylvania grade lubricating market and the lubricating markets in other parts of the country?

"A. Yes. When the prices for Pennsylvania lubricants decreased, usually it causes the prices of lubricants in other parts of the country to decrease. But if there are large quantities of lubricants produced in other fields, say the Mid-

2566 Western area, these large stocks have a tendency to cause the Pennsylvania grade lubricants to pile up and the Pennsylvania prices to be lowered.

"Q. What about the relation between the price of Pennsylvania gasoline and of Mid-Continent gasoline?

"A. The price of Pennsylvania gasoline is more immediately affected by over-production in Oklahoma and Texas and the prices in those states because when the price is very low in Texas the gasoline can be shipped into Pennsylvania and compete with our gasoline just like our gasoline will move into the Mid-West if their price gets too high.

"Q. Would you say that it is your recollection that at this meeting at which Mr. Shaughnessy representing the P. A. B. was present, the situation of the Pennsylvania independent refiners was brought out?

"A. It was.

"Q. To the best of your recollection, what was the situation of independent Pennsylvania

2567 refiners which was pointed out at that meeting?

"A. It was brought out that the Pennsylvania independent refiners, particularly the small ones, were not able to operate profitably. Some of them were closing which had been in existence for many years. Excess production and runs tc stills caused excess stocks which depressed prices and caused them great difficulty.

"Q. How long had these refiners been in business?

"A. Many of the refiners who were having difficulty and who had to go out of business in the spring of 1935, had been in business and been operating for 30 or 40 years.

"Q. Do you know whether Mr. Shaughnessy brought these factors you have described as existing in Pennsylvania, to the attention of the P. A. B.?

"A. I understand he did; that was why he was at our meeting.

"Q. Did you bring to the attention of the P. A. B. any of these factors in regard to the 2568 situation of the Pennsylvania refiners at any time after the February 1, 1935, meeting in Pittsburgh?

"A. Yes, in my letter of May 9th I pointed out that there were top-heavy inventories of lubricants which had been accumulated for some time past and which had demoralized not only the Pennsylvania market for lubricants but the national market as well. I also pointed out how there was too much producing and refining of oil and that two refineries had to stop.

"Q. In reply to your letter, you then received Mr. Swanson's letter of May 18th?

"A. Yes.

"Q. Do you know Mr. S. M. Vockel and Mr. C. E. Willey of the Waverly Oil Works Company at Pittsburgh, Pennsylvania?

"A. I do not. I may have met them, but I do not recall.

"Q. Before you wrote the letter of May 9, 1935, did you talk with Mr. Vockel or Mr. Willey or anybody connected with the Waverly Oil Works Company?

"A. No, I didn't.

2569 "Q. Did you write the letter without instigation or suggestion from anyone?

"A. Yes. I wrote the letter because I saw the plight of the small Pennsylvania producers and refiners and believed it should be brought to the attention of the Petroleum Administration so that steps could be taken to save them from bankruptcy. At that time I was trying to get production allocations reduced and runs through stills reduced so that the prices would go up by limiting the supply to the demand.

"Q. When you received that letter, did you know what Mr. Swanson in his letter for the Board meant when he said that 'as a result of these conferences it was felt that the stabilization committee of the Planning and Coordination Committee which is under the chairmanship of Mr. C. E. Arnott might be of definite assistance in connection with gasoline'?

"A. Yes, because I knew from my reading of trade journals and my conversations with various persons that Mr. Arnott, as head of the Stabilization Committee, was sponsoring some kind 2570 of arrangement in the Mid-Continent area whereby the major companies were purchasing distress gasoline from independent refiners. I concluded that Swanson was telling me that the P. A. B. had asked Arnott to set up a Stabilization Committee in Pennsylvania to conduct a buying arrangement of excess Pennsylvania lubricants then in the hands of small Pennsylvania refiners which were depressing the market for lubricants as described in my letter of May 9th to the P. A. B.

"Q. Did you show the letter you received from Mr. Swanson to Messrs. Vockel or Willey or anyone else in the Waverly Oil Works?

"A. I did not.

"Q. Did you see any of the letters which they sent or received from the P. A. B.?

"A. No.

"Q. Did you in May, 1935, discuss the P. A. B. action with them?

"A. No, I did not."

Mr. Chaffetz: That is objected to for the same reasons urged in the preceding offer.

The Court: Objection sustained. Exception allowed.

2571 Mr. Donovan: Your Honor, I would like to file a short statement in connection with that offer, to be made a part of the record of the offer of proof, as to why we think it is material; and I think I can reduce it to short form, if your Honor will permit me to file it.

The Court: You may do so.

Mr. Chaffetz: We have no objection.

(During the absence of the jury at the recess, counsel for the defendants presented to the Court the following statement of reasons for the admissibility of certain testimony as to the situation of the Pennsylvania refiners, on which an offer of proof was made heretofore; which statement of reasons is made a part of the record by leave of the Court:)

Reasons why the testimony proferred as to the situation of the Pennsylvania refiners is material and relevant.

This statement is made pursuant to the defendant's request of yesterday afternoon granted by the Court, to file its statement reduced to short form as to why the defendants contend that the testimony set forth in the offers of proof and the exhibits relative thereto, pertaining to the situation of the independent refiners in Pennsylvania, is material and relevant in this case and should have been admitted in evidence.

The defendants contend that the testimony which 2572 the witnesses, John W. Frey, S. M. Vockel, and W. J. Brundred would have given and which testimony was read into the record as offers of proof, together with the exhibits relative thereto, is material and relevant in this case for the following reasons:

From the testimony in the offers of proof pertaining to the conference of April 8, 1935, with the Petroleum Administrative Board, and the correspondence in connection therewith, the jury would know, and could draw the inferences and conclusions that during April and May, 1935:

I. The Petroleum Administrative Board (a) knew of the activities in the Mid-Continent area then being conducted by the Stabilization Committee to aid the independent refiners and to stabilize the refinery gasoline market; (b) knew that such activities were being conducted by the Tank Car Stabilization Committee appointed by Mr. Arnott, purporting to act under the letter of July 20, 1934, which he had received from Mr. Ickes; and (c) that such activities were not secretly nor furtively conducted, but were publicly and openly discussed among persons in the oil business and among persons in the Petroleum Administration.

II. The Petroleum Administrative Board knew

2573 that the work of the Stabilization Committee in the Mid-Continent area in aiding independent refiners and in stabilizing the refinery gasoline market was being conducted under the Petroleum Code, and that the Stabilization Committee conducting this work was a sub-committee of the Planning and Coordination Committee.

III. The Petroleum Administrative Board encouraged, sanctioned, acquiesced in, and was gratified with the work of the Tank Car Stabilization Committee in the Mid-Continent area in aiding independent refiners in removing distress gasoline from the market and in attempting to stabilize the refinery gasoline market, and wanted such work to continue until refinery gasoline prices reached the proper parity with the price of crude oil, and recognized that such work was useful and constructive.

IV. The Petroleum Administrative Board considered (a) that the work of the Stabilization Committee in the Mid-Continent area relative to independent refiners and the gasoline refinery market
was a proper activity, within the scope of the stabilization work which had been authorized by the
Petroleum Administration, (b) that such work was
a proper activity to carry out the objectives of the
2574 Petroleum Code and to effectuate Rules ~~4~~ and 6 of
Article V of the Code, and (c) that such work did
not need specific approval under Article IV, Section 6 of the Code, as that section had been administratively interpreted by the action of the Petroleum Administration.

From the testimony in the offers of proof relative to the conferences of May 13 and 14, 1935, and the correspondence pertaining thereto, together with the testimony showing that the Petroleum Administrative Board (a) knew of the conditions of the oil industry in Pennsylvania, and particularly the conditions of the independent refiners in that state, (b) knew that there was a lack of parity between the price of Pennsylvania grade crude oil and the prices for refined products in Pennsylvania, and (c) knew that there were excessive inventories of lubricants in the hands of Pennsylvania refiners, the jury would know and could draw the inferences and conclusions that:

I. The Petroleum Administrative Board recognized that the situation of the refinery lubricating

market in Pennsylvania and of the small Pennsylvania refiners in May 1935 was similar to the con-
2575 dition of the independent refiners which had existed in the Mid-Continent area, and that in sending the telegram of May 14, 1935 to Mr. Arnott, the Petroleum Administration recognized during the spring of 1935 that Mr. Arnott and the Stabilization Committee had authority under the letter of July 20, 1934 and under the stabilization work, as that letter and work had evolved and expanded in prior months with the knowledge and approval of the Petroleum Administrative Board, to assist independent refiners by removing their distress products by means of a buying program conducted as part of the stabilization work without having to obtain specific approval from the Petroleum Administrator to such program.

II. The Petroleum Administration, recognizing the situation in Pennsylvania, urged and requested Mr. Arnott to undertake in Pennsylvania as part of the Stabilization Committee work, such activities as he deemed necessary or were necessary to remove excessive stocks of lubricants in the hands of Pennsylvania independent refiners and to bring about a proper parity between the price of Pennsylvania grade crude oil and the prices of Pennsylvania lubricants, by the same means, which Mr. Arnott had
2576 described to the Petroleum Administrative Board, that the Stabilization Committee were using in the Mid-Continent area in connection with the refinery gasoline market and independent refiners, thereby sanctioning such work in the Mid-Continent area.

III. The Petroleum Administrative Board, in asking Mr. Arnott to undertake refinery lubricant stabilization work in Pennsylvania, was again urging cooperative action on the part of the oil industry as it had urged many times before to accomplish the objectives of the Petroleum Code, to raise refinery prices to normal levels and to proper parity with the price of crude oil, to effectuate Rules 4 and 6 of Article V of the Code, to eliminate excessive inventories which depressed markets, and to stabilize refinery and other prices.

IV. The Petroleum Administrative Board, by its action regarding the Pennsylvania situation, confirmed that it had administratively interpreted Article IV, Section 6 of the Code as not covering informal cooperative buying activities of the kind conducted by the Stabilization Committee in the Mid-Continent area in connection with refinery gasoline market, the removing of distress gasoline, and the 2577 aiding of independent refiners.

V. The Petroleum Administrative Board and its members led Mr. Arnott and his associates of the Stabilization Committee, by the telegram of May 14, 1935, to believe: (a) that they could properly undertake the work of the Tank Car Stabilization Committee of stabilizing refinery markets anywhere as a proper stabilization activity under the Code; (b) that such work was properly authorized by the Petroleum Administration and should continue; (c) that such work properly came within the scope of the letter of July 20, 1934, as that letter and the work done under it had evolved and expanded with the knowledge and approval of the Petroleum Administration; (d) that such work did not necessitate specific approval by the Petroleum Administrator under Article IV, Section 6 of the Code or any other section of the Code; and (e) that such work was properly conducted under the provisions of the Petroleum Code, or at least came within the objectives of that Code and did not create a monopoly, cause monopolistic tendencies or practices, nor discriminate against small enterprises.

VI. Neither Mr. Fahy, the Chairman of the Petroleum Administrative Board, nor any other member of the Board, considered at the conference of 2578 March 12, 1935, or the conference of May 8, 1935, or at any other time, that the activities of the Stabilization Committee in the Mid-Continent area relative to refinery gasoline markets, the removal of distress gasoline, or the aiding of independent refiners, violated the anti-trust laws, needed specific approval under the Petroleum Code, or was contrary to either the provisions or the objectives of the Petroleum Code since Mr. Fahy asked (a) Mr. Arnott to undertake in Pennsylvania such similar activities as he deemed necessary in connection with refinery lubricating markets to aid the small Pennsylvania refiner, without placing any limitations or conditions upon such activities, and (b) recognized that such activities properly came within the scope of the Stabilization Committee's activities.

From all of the evidence in the offers of proof relative to the situation in Pennsylvania, the jury is entitled to draw the inferences and conclusions that no conspiracy to fix high and arbitrary prices as alleged in the indictment could, or did exist, since the 2579 actions of the defendants in the Mid-Continent area were known, encouraged, and acquiesced in by the responsible government officials charged with the duty of carrying out the Petroleum Code and its objectives and preventing any action purporting to be under that Code which would create a monopoly, have a tendency to monopolize, be a monopolistic practice, would discriminate against small enterprises, or in any way would be contrary to law or to the Petroleum Code.

From all of the facts in the offers of proof relative to the Pennsylvania situation, the jury is entitled to draw the inferences and conclusions that the defendants had no intent or purpose to violate the antitrust laws, or to conspire to fix prices as charged by the Government in this indictment, but that the defendants involved in the buying activities in the Mid-Continent area had the purpose and intent to abide by the Petroleum Code and the objectives thereof and to assist in carrying out such activities as they thought, and were justified in believing, were authorized by the Petroleum Administrator or his authorized agents.

(Document previously so marked for identification is received in evidence as EXHIBIT 936.)

2580 (The following proceedings were had in the presence of the jury.)

H. RUSSELL RICHARDS, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am, and during 1934, 1935 and 1936 was, employed by Continental Oil Company, at Ponca City, Oklahoma, as a clerk in the order and distribution divisions, which is a branch of the marketing department, and which directs the distribution of products to the marketing outlets and customers. It defines the territories that will be supplied by our refineries and terminals; it handles purchases; and it receives copies of all tank car gasoline orders placed with the company.

In the case of orders which have not already been assigned or placed with one of our refineries by the division with which the order was placed, our division designates which one of the company's refineries will supply the gasoline. In the case of orders which have already been assigned to one of the refineries by the division in which the order was placed, we merely file the order, except in the case of orders covering non-contract sales to customers we send the order to the general sales department for the checking of price before filing the order.

2581 I have prepared a tabulation showing all non-contract sales to jobbers made by the company during the years 1935 and 1936 within the Mid-Western area described in the indictment.

In preparing this tabulation, I first went to the files of the general marketing accounting department, which receives a copy of every tank car invoice issued by the company, and sorted all contract invoices from non-contract invoices. The invoices are marked "contract" on sales to contract customers, and are marked "spot" on sales to non-contract customers. The invoices are made in the division office where the sale is made, and from the original order for the gasoline. The original order is called a stock purchase and shipping order. At the time this original order is prepared the person making out the order consults the file of contract customers and if the sale is made to a customer under contract, the order is marked "contract", and if it is made not to a contract customer it is marked "spot".

After that sorting out of those invoices, I associated the spot invoices with the stock purchase and shipping orders, which are kept in the files of the order and distribution division. The invoices were matched up with the orders because the order shows the date that it was placed with the refinery, and also the price or price basis agreed upon at the time the order was placed.

2582 If the customer telegraphed or wired his order in to the division office the date the order was placed with the refinery would be the same date that the customer placed his order. If it was mailed in it would be the date on which the order was received. The company routine requires that the stock purchase and shipping order be made out on the date the customer's order is received and accepted.

If one of our division offices were to sell an order of gasoline to a customer, and the price agreed on was the low of the Chicago Journal of Commerce on date of shipment, the fact that the gasoline had been sold on that basis would appear on the stock purchase and shipping order. The invoicing clerk in the division office who makes out the invoice would have to know the price basis that the material was sold upon in order that he might make out his invoice. Also, company routine requires that the price or price basis be shown upon all orders covering sales to non-contract customers.

I have here with me the original invoices and orders from which I made the tabulation.

(Tabulation referred to is received in evidence as EXHIBIT 926.)

Cross-Examination by Mr. Lewin.

I am not in the sales department and do not make the sales. I prepared the records, but am not qualified to testify as to the length of time that has elapsed between the making of a sale and the consummation of 2583
it, or what the company considers as a spot basis. I examined these records. All that information is contained in the tabulation, the date of the order and the date it was shipped.

I am not an auditor. I am in the order and distribution division, and handle the order work of the company, and in connection with that work I have charge of the records, and am familiar with the records. As I testified, I separated the spot sales from the contract sales by the markings on the invoices, and by associating them with the orders; and then, to insure that I had spot sales to jobbers, I sent the tabulation sheets to our division offices, who made the sales and were familiar with the nature of the business, to identify the type of customer, to identify the jobber customers.

A customer not under a yearly contract or any written contract with the company would be considered in the classification as a spot customer.

The "date shipped" on this tabulation means the actual date on which the shipment was made. I had nothing to do with the shipping. The shipments are made by the refinery.

I examined these purchase orders. Many purchase orders do not require any shipping date. There may 2584 be some exceptions that they did not ship on the date that it specified on the order, due to refinery difficulties or some other reason why the customer's request for a shipping date was not observed. In most cases the shipping date agrees with the date specified on the order, however. It is possible that in some cases it doesn't agree.

The purchase order covers the date that it was placed, the order number, the consignee and destination, the quantity ordered and the description of the product; and if the customer had specified a shipping date, that would appear on the purchase order. The purchase order is made up and dated the day that it is received from the customer.

I would have to examine these invoices to answer the question as to the longest period of time that elapsed between the date of the purchase order and the date specified in any of those purchase orders for the shipment to be made. The invoices do not contain all the information the purchase orders contain. They are made up from the purchase order as to the order date and the consignee and that information, but if the shipping date was written on the purchase order that would not appear on the invoice.

None of the purchase orders that I have examined and listed in this tabulation call for shipments of the material over a period of time in the future. There were no such purchase orders for gasoline lodged with Continental Oil Company during 1935 and 1936 that were not under a written contract. 2585

(Stipulations as to (1) the testimony of George Collins of Omar Refining Company, (2) the testimony of M. L. Smith of Kanotex Refining Company, (3) the testimony of L. D. Hinman of Eason Oil Company, (4) the testimony of J. D. Miller relative to Black Gold Refining Company, were offered by Mr. Donovan and were received in evidence, respectively, as EXHIBITS 927, 928, 929 and 930.)

2586 JOSEPH W. BURRELL, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am, and was in 1935 and 1936, employed as an accountant by Cosden Petroleum Corporation, an independent refiner at Fort Worth, Texas. Its refinery is located at Big Spring, West Texas.

During the years 1934 through 1936, I kept or supervised the keeping by our company of records showing its gasoline production and gasoline sales.

During those three years approximately 3% to 5% of our gasoline sales were to major companies; it varied from month to month. These sales were made to points in New Mexico within a radius of 100 to 150 miles from our refinery in West Texas.

Approximately 80% of the sales during that period were made to brokers, and distributed to them by tank car shipment. Shipments were made into Illinois, Michigan, Minnesota, Wisconsin, Missouri, and this territory.

During this time the company made sales direct to jobbers, and to jobbers in the Mid-Western area.

I have prepared a schedule showing the monthly production and sales of gasoline in terms of gallons by
2587 Cosden Petroleum Corporation for the years 1934 through 1936.

(Schedule referred to received in evidence as EXHIBIT 931.)

The production of gasoline in gallons for 1934 was 50,353,355 gallons; for 1935, 52,968,256 gallons; and for 1936, 70,505,059 gallons.

The gasoline sales for 1934, 49,101,172 gallons; for 1935, 53,613,513 gallons; and for 1936, 69,581,998 gallons.

During the years 1934 through 1936 our company had its own crude production, but used only the part of its own crude that was produced in areas conveniently located to its refinery. During that period we bought 90% of the crude used in our own refinery.

During those years the company manufactured third grade gasoline, and also unleaded gasoline having an octane rating between 68 and 70. About 65% or better of our gasoline sales were sales of 68 to 70 octane gasoline.

Cross-Examination by Mr. Lewin.

Our company has subsidiaries: Cosden Oil Company of Illinois, a marketing company with no refineries or production; Cosden Oil Company of Arkansas, an inactive company operated for the purchase of leases in that state; J. S. Cosden Company, Incorporated, which produces oil in
2588 Oklahoma. It is a production company only and it has no refineries. And also Cosden Pipe Line Company.

There is no Talbot Petroleum Company that I know of. I know a man in the oil business in Chicago named Talbot. He is connected with Petroleum Exchange Corporation. Our company has a business relationship with the Petroleum Exchange Corporation, a brokerage concern. It handles the majority of our gasoline coming into this territory.

We sell it to it directly. I believe there was a written contract between our company and Petroleum Exchange Company during 1935 and 1936. I know we make some sales in this territory that are not sold to Talbot.

Of the 80% of our total gasoline sales which we sold to brokers, I would say the majority of it was sold to Petroleum Exchange Corporation. In fact, I believe, during 1935 and 1936, the entire 80% sold to brokers was sold to the one broker, Petroleum Exchange. It is my understanding that that broker in turn sells to jobbers in this territory.

I know of no loan ever made to our company by Petroleum Exchange Company or interests connected with it, nor is there to my knowledge any connection of a financial nature between Petroleum Exchange Company and Cosden Company, whereby Petroleum Exchange Company finances to any extent Cosden Company.

2589 I estimated that about 80% of our company's gasoline production was sold to Petroleum Exchange Company during 1935. I said 3% to 5% during that year was sold to major companies, say 4%, roughly. Of the 16% remaining, I don't believe any was sold direct to consumers during that period. Some of that 16% was sold to other refiners except major companies, 1% to 2%, possibly, say 2%.

The remaining 14%, roughly, would be the amount in that year sold to jobbers. I don't suppose, during 1935 and 1936, there was over 1% sold to jobbers in the Standard of Indiana territory. I couldn't tell you how much of that 1% was sold under contracts with jobbers and how much sold on the spot market. I have heard that some of that 1% was sold under contract. That leaves approximately 13% sold in Texas to jobbers. Just like the Petroleum Exchange contract, it is hearsay with me. I have never seen the contracts. I don't know anything about them.

2590 R. E. FOWLER, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am, and was in 1934 through 1936, employed by Sun Oil Company at Yale, Oklahoma, as its refinery office manager. During those year the company had a Chicago sales office and the orders for gasoline from that office came to the Yale refinery. A small percentage of the orders for that refinery were from the Tulsa office.

The company sold its gasoline on the spot market from the refinery at Yale, Oklahoma, during the years 1934 through 1936, into Oklahoma, Kansas, Nebraska, Missouri, Illinois, North and South Dakota, Minnesota, Wisconsin, and some few shipments in the western part of Michigan. During that period the company sold not more than 4% of its gasoline in Oklahoma and Colorado.

We sold during that period two grades of gasoline in the states I have referred to. 17% was our grade known as 68-70, 350 endpoint; and the other 83% was third grade gasoline.

I have prepared a schedule breaking down our annual totals for gasoline production and sales in gallons into months. I have that schedule with me for the years 1934, 1935 and 1936.

(Schedule referred to is received in evidence as EXHIBIT 932.)

2591 Our gasoline production in 1934 was 9,393,906 gallons, and the gasoline sales were 9,742,313 gallons.

In 1935, the production was 10,293,795 gallons, and the sales were 10,349,048 gallons.

In 1936, the production was 8,519,371 gallons, and the sales were 8,339,483 gallons.

No cross-examination.

2592 W. E. SWOR, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am employed as chief accountant by Rodessa Refining Corporation at Shreveport, Louisiana. I have been with this company since its inception in September, 1935. It is an independent refiner and its refinery is located approximately 5 miles from Shreveport. Since the company has been in business I have been in charge of the records showing its production and sales of gasoline.

During that period the company sold gasoline to both jobbers and brokers, in the spot market. It sells a portion of its gasoline in the Mid-Western area.

The gasoline production of the company for 1935 was 3,319,596 gallons, and sales were 2,819,502 gallons.

In 1936 the gasoline production was 27,909,042 gallons, and sales were 27,636,252 gallons.

My sales figures do not include any quantities of finished gasoline purchased outside and resold by the company.

I have prepared a tabulation from the company records breaking down these figures I have just given by months. I have that tabulation with me.

(Tabulation referred to is received in evidence as EXHIBIT 933.)

2593 *Cross-Examination by Mr. Lewin.*

I am not in a position to say what percentage it was, but I know that gasoline was sold in North and South Dakota, Illinois and Oklahoma. Our principal market is in the Arkansas, Louisiana, and Texas area. When I say it is sold on the spot market, I refer to every place that it is sold. It is sold at spot, except the brokerage. A portion of it is sold on the spot market of Oklahoma. I do not know the percentage. I am really not in a position to say whether it is a large or small percentage. I am not in the sales department, and therefore, wouldn't know that.

2594 ARTHUR L. TREASHER, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I am employed by Deep Rock Oil Corporation, which is now in trusteeship. I am auditor of the distributing division, and acting assistant secretary. I was acting as its assistant secretary during 1934, 1935 and 1936.

The company's refinery is located, and was from 1934 through 1936, at Cushing, Oklahoma. The company sells its gasoline in the Mid-West area: in Wisconsin, Minnesota, North Dakota, South Dakota, Iowa, Nebraska, Illinois, Indiana, Missouri, Arkansas and Oklahoma.

During 1934, 1935, and 1936, the company sold gasoline to jobbers in those states, but sold very little gasoline to brokers. It also sold gasoline through its own stations. The gasoline that we sold to jobbers was sold both under contract and on the spot market. During those years the company sold some gasoline to major companies who are defendants in this case.

I have made a tabulation, from the regular records of the company, showing the monthly sales of gasoline in gallons by the company from January 1, 1934, to December, 1936. Those sales figures do not include purchases of finished gasoline made by our company and resold. They are limited to sales of gasoline produced by the refinery.

2595 The total refinery sales of gasoline by our company during each of these three years were: in 1934, 64,247,774 gallons; in 1935, 64,996,976 gallons; and in 1936, 72,490,262 gallons.

I also have a tabulation showing the company's monthly production of gasoline in gallons during the years 1934 to 1936 inclusive. Those figures are: in 1934, 62,420,232 gallons; in 1935, 68,438,160 gallons; and in 1936, 73,511,513 gallons.

(Tabulation of sales figures referred to is received in evidence as EXHIBIT 934.)

(Tabulation of production figures referred to is received in evidence as EXHIBIT 935.)

Cross-Examination by Mr. Lewin.

I think Deep Rock Oil Company is known generally in the trade as a semi-major company.

2596 SIDNEY A. SWENSRUD, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I live in Cleveland, Ohio and am assistant to the president of the Standard Oil Company of Ohio. That company is not an integrated company; it is primarily a refining and marketing company. Up to a few years ago, we had no crude oil production at all, and no interest in transportation by pipe lines. We now have a very small amount of each of those, but, substantially speaking, we are still almost exclusively a refining and marketing company.

I have charge of a number of departments, including the traffic, purchasing, and the so-called distributing departments, the latter handling the shipping of products; and I have charge of our pipe line companies. I am also a director and participate in the management of Fleetwing Corporation, which is a subsidiary that sells gasoline to jobbers. I assist in the formulation of policies, and most of the time I have been with the company I have had charge of the commercial research, primarily in the marketing end, and, as a director participating in the management of Fleetwing Corporation, of course, I have a direct contact with the marketing there.

I am concerned very largely with marketing and do 2597 a certain amount of direct selling of tank car gasoline from time to time. We are constantly trying to learn all we can about the marketing of gasoline in our territory and elsewhere. We operate service stations and tank trucks. We sell to jobbers. That means we have to try to know what we can about what is going on in those fields, and try to improve our operations.

For example, we might do some research into why customers come into our stations, in order to try to find out how we might get more of them in. And we might study the question of how to determine the best location for a service station, what factors enter into that question, what accounts for the volume at any given station, and that sort of thing.

I have done much of price research also, because, as any one in this business knows, the problem of price is ever-present. We have so many parts of a price structure that it requires constant study to work out intelligent policies. I spend a great deal of time studying those questions.

Fleetwing Corporation sells gasoline and other products to its jobbers under the name Fleetwing. It sells to jobbers in New York, Pennsylvania, Kentucky, West Virginia, Indiana, Michigan, and Ohio.

I have been with Standard of Ohio since August 1, 1928.

Prior to that I was on the faculty of the Harvard 2598 Business School. I worked there for a few years after graduating from that school, and did work mostly in the marketing division of the school, primarily making studies into the costs of doing business and other marketing practices and the like, in a number of wholesale and retail trades, including groceries, jewelry, stationery, building materials, plumbing and heating supplies, and several other lines of business that we were studying there. I made a rather exhaustive study of the relationship between the price of raw cotton and the price of cotton goods. It covered a period of about 6 years, and we studied the day to day quotations for all that period.

I am and have been for several years chairman of the economic part of the petroleum section of the American Mining and Metallurgical Institute.

I was a member of the Price Research Committee of the National Bureau of Economic Research. The purpose of that Committee was to make certain recommendations of profitable research that could be done in regard to prices and costs in the oil industry. There were similar committees for the various other industries many research institutions in this country doing research on various subjects, and we have been working to try to coordinate and suggest a general plan of research that might be followed.

The first work I ever did for the Government was 2599 on the Committee on Petroleum Economics, of the Federal Oil Conservation Board. I was appointed by Secretary Wilbur, who was then Secretary of the Interior and Chairman of the Federal Oil Conservation Board. I was on that Committee for several years.

Then, during the formulation of the Oil Code, I was asked to and did consult with the Deputy Administrators who were assisting Hugh Johnson in formulating the Oil Code.

Later I spent time on several occasions with the Petroleum Administrative Board, consulting with them on various subjects, particularly the price fixing schedule that was at one time devised and was going to be issued, but never was.

I was also a witness for the Government in two of the premium cases that it brought during the Code days against certain marketers who were giving way premiums with the sale of gasoline.

I was a member of the Petroleum Code Survey Committee for Small Enterprise, known as the Blazer Committee. That Committee was appointed by Secretary Ickes. The purpose of it was to study the plight, or the condition and status of the small units in the oil industry, and to see how they had fared under the Code.

Mr. Ickes told us that he had got a lot of complaints from various sections of the industry, particularly 2600 from the small refiners, the independent refiners, and to a considerable extent also from certain sections of the independent marketers. He wanted a committee of people who were familiar with those problems to study them and make recommendations to him as to what, in our judgment, could be done under the Code to help the situation of those small units. We worked at that from about early in January, 1935, until late in February or the early part of March, when we submitted our report to the Secretary. I would say I have made a continuous study of marketing conditions and problems in the oil industry, and various special studies from time to time. Some of my published articles are entitled, "Distribution Problems in the Oil Industry," "Domestic Marketing of Oil Products," "Economics of Domestic Distribution," and others on such subjects as marketing in the oil industry, the factors affecting the supply and demand, and the effect of gasoline taxation on the consumption of gasoline.

Standard Oil Company of Ohio itself does business almost exclusively in Ohio. Fleetwing Corporation sells only to jobbers under the Fleetwing name in Ohio and in the surrounding states, including, in the Mid-western area, Indiana and Michigan.

Our company does not produce any crude, with the exception of a few barrels. We get our crude from a number
of different sources. About half of it we get from
2601 Oklahoma where we buy it from the Carter Oil Com-
pany, and we get lesser portions from Michigan, Illinois, Kentucky and Ohio. I do not believe we buy a barrel of crude oil from any defendant in this case.

I have made several special studies of particular questions in the Standard of Indiana territory, and have become familiar with some of the aspects of marketing in Indiana and Michigan where we market through Fleetwing Corporation.

In the course of my marketing studies I have had occasion to look into the classes of users of gasoline. I was asked at one time to attempt to determine where gasoline finally goes. I found 60% of the gasoline went to passenger cars, and the other 40% went to what we may call the commercial users, primarily, trucks, busses, taxicabs, aviation, and stationary engines on farms, farm tractors and that sort of thing. Trucks take approximately 30%, perhaps a little less than that. Buses and taxicabs take probably about 4%. The aviation industry is, of course, taking more and more, probably 2% or 3% now. It was about a little over 1%, as I recall it, when I made my analysis 4 or 5 years ago. Then the farm agricultural consumption, including stationary engines and tractors and that sort of thing, probably 3% or 4%.

And there is another use; contractors and road builders
and people who have commercial use for stationary
2602 engines and also tractors. That would be probably
3% or 4%. There is a decided difference in the way in which these various classes of users, consumers of gasoline, obtain their gasoline. The passenger car owner, of course, buys most of his gasoline at service stations, but the other classes that I have mentioned get a very large part of their gasoline delivered direct to the storage of the owner by tank truck, commonly called tank wagon delivery in this industry, dating back to the time before they had tank trucks. In that case, of course, the gasoline is hauled direct by the jobber or the distributor to the final consumer in the tank truck.

Now, that typically would be the case of a taxicab company, for example. It would probably have a garage where it keeps its cars and has tanks, and the gasoline would be brought right there in trucks and put in that storage.

The farmer gets most of his gasoline in that manner. The trucks bring it right up to his farm. The same would be true with a good many users of trucks, like a department store. If such a consumer were large enough, he might even short-circuit the tank truck and buy direct in tank cars. If he used say 5,000 to 10,000 gallons a month he would probably get delivery direct by tank car.

Now, of course, the purpose of this tank wagon and
2603 tank car delivery is to get a lower price than the consumer would get if he went to the service station and bought his gasoline there. The discount for tank truck delivery ranges from 2¢ to 4¢, I would say, below the service station price.

About 20% at least of all the gasoline sold is delivered direct to the consumer in tank trucks, and I think probably it is nearer 25%. I would like to put the figure about 30%, as representing the total deliveries direct to the consumer that did not go through service stations. That 30% consists of about 25% tank truck and 5% tank car deliveries.

For those tank truck and tank car deliveries the consumer gets a lower price. For the tank truck delivery depending on the volume he buys, and also depending on the —the thing changes from time to time—but I would say, by and large, he gets a discount of from 2¢ to 4¢ under the service station price by taking tank truck deliveries; and if he buys in tank cars he pays about the same price the jobber would pay, probably 5½¢ to 6¢ below the service station price.

I have been describing the wholesale types of delivery. It is possible to contend that those are really retail deliveries. The oil industry, however, considers them wholesale deliveries. It is perhaps a loose use of the word, but it is considered wholesale as compared with sales
2604 through a service station.

The rest of the gasoline is marketed through service stations, that is the retail outlets, including not only the service stations you see on the corners, but the garage and curb pumps that handle gasoline. Service stations painted alike, and bearing similar signs, with the name of some refining company does not mean that those stations are operated by the companies whose signs they bear. It would almost never mean that today in this territory. Back in 1935 many of the refining companies owned and operated service stations themselves, so that in that year it is quite possible that a service station you saw would have been owned and operated by one of the refining companies. It would not necessarily mean it was so operated. Even in that year the great majority of retail outlets were owned and operated by the independent dealer and not by the company. The mere display of the sign of a company is no indication of the ownership by the company of that station. In fact today it would almost never indicate the operation of the station.

You have to consider the fact that gasoline service stations are different than a lot of other retail establishments, in that they handle the products of just one company, ordinarily. A grocery store or a hardware store or a drugstore handles the products of hundreds of manufacturers, and could not very well identify itself with the insignia
2605 or colors or signs of any one particular manufacturer.

But a gasoline service station typically handles the production of just one supplying company. There are small exceptions, like spark plugs, batteries, and a few things like that, but his main product is gasoline and oil which are usually supplied to him by one company. Naturally, therefore, he takes advantage of the fullest advertising he can. That company does a lot of advertising, and he wants to get in on it, so to speak, so he displays all the identification that he can to show his connection with that supplying company. He also gets a lot of things that way that he would have to pay for otherwise. He might get his station painted up, parts of it at any rate, and he would have his pumps supplied to him, and also the tanks that hold the gasoline under the ground. Those would be furnished to him by the supplying company, and kept in operation by him. All that saves his money and adds to his business by giving him free advertising, so to speak.

On the pumps at these various stations there is the price at which gasoline is sold. Those stations do not always charge buyers the price which is shown on the pump. There are many exceptions to that. The service station price is paid by the average passenger car operator who sim-
2606 ply drives in, but I suppose the great majority of trucks—to take one example—even though they buy at a service station they do not pay the price which is posted there for that gasoline. They get a discount, and that is true of a good many other classes of buyers.

For example, a salesman driving a car for his company may have an arrangement with that service station under which he gets a discount under that posted service station price.

You cannot generalize very much about how the seller identifies the person to whom he will give a discount because the methods change so much from time to time and place to place. At times there have been official published commercial discount schedules under which the company operating the station says we will give to a commercial operator a certain discount. But now especially, under the Iowa plan, I would say there is very little in the way of published schedules or statements of discounts that will be offered.

That is, the supplying company may make an arrangement with the owner of a large number of trucks under which they agree to give him a certain price below the service station price—on his purchases at those service stations.

I would say that in the majority of cases it is a
2607 private arrangement between the particular customer
and the particular service station operator. You may have a truck, and you may go to Mr. John Jones, a dealer who operates an independent service station, and you make an arrangement with him under which you buy your gasoline there for your truck, and he will give you a discount of 2¢ off the service station price. If you are a big operator he might even do better than that and you may not need any identification at all.

You go down the road and you may see some signs, "Trucks Welcome Here," and you are not left in much doubt as to what that means. It means, if you drive in and if you have got a truck, you will get a discount. Now that practice varies. In some cities that I know of today the vast majority of gasoline is sold at a discount under the service station price.

I would say, by and large, the retailer who operates the station stands the discount himself. However, where the schedules have been formally or officially formalized, the supplying company might underwrite those discounts, and it might be in connection with the charge account system.

In other words, you might have a bunch of trucks and make an arrangement with a certain supplying company under which they would agree to supply you at a number
of stations, perhaps scattered all over the country;
2608 and then the operators of those stations would turn in
the charge—bills—of those purchases to the supplying company; and at the end of the month you would send a bill to this account and collect the money that was due, and you would then probably underwrite those discounts of that dealer, so that he would get his full margin on those

sales, as well as the others. But I would say that is not the typical situation.

Typically, the dealer makes his own discount, and suits himself as to what amount, if any, he wants to give. His incentive is to get the extra business, because even at a 2¢ discount he still makes say, 1½¢ to 2¢ a gallon on that business.

He figures, well, if I don't give a discount I don't get the business; therefore, I better give a discount and at least get that 2¢. I can't get the full price, but I can get at least something that I would not get otherwise. I think that is his typical psychology, and it probably is good business on the whole.

In my studies I would say I have almost invariably found the same price for the same grade of gasoline in the same locality. There isn't any mystery about it, although there seems to be. If you will just think about it a little bit.

Suppose you are a Phillips dealer on one corner of the
2609 street, and across the street is a Barnsdall dealer, or
any other company you might mention, and let's say that your competitor has a brand of gasoline that is essentially the same general kind as you have. Each of them claims certain superiorities, of course, but you can't get away from the fact that they are largely the same type of gasoline. And if he cuts his price, you are just going to lose your business pretty fast, if you don't meet it.

Now, then, you have got to remember that your gasoline stations are practically out on the street and it doesn't take long for every service station operator up and down the street to find out what the Barnsdall dealer's price is, if he happens to be the one that is cutting it. So before night I would say that every station on that street and so on until every station in the town would have adopted the price of the one who cut the price. In other words, it is almost instantaneous.

Now, there is another circumstance that often does make it absolutely simultaneous, because the company that wants to change the price,—it takes a little time ~~to do~~ it. You can't just decide at 8 o'clock this morning to put in a new price today. You have got to get notices out to dealers, to your own stations. You have to take inventories to see what the condition of the stocks were before the price
changed, and so forth. It takes a couple of days to
2610 do it effectively and to get it down so that everything
is right. Now that means that a lot of people have got to know that you are going to change the price within a day or two. And this inevitably gets into the newspapers.

The public is very much interested in the price of gasoline. I don't believe that our company has ever made a change in the price of gasoline that wasn't on the front page of the Cleveland papers and probably of all other papers in Ohio the day before we were going to make it. Even if we don't issue any announcement to the public they find it out in one way or another, and it becomes a public news item.

Naturally every other company sees that announcement. They are not going to open up the next morning with a higher price than we have, so the next morning the prices are all the same, and that apparently is why people think it is queer.

It is not peculiar to the oil business. If you will think a minute, you will realize that if the drug store on one corner puts the price of Pebeco Tooth Paste down to 39¢, it won't be very long before the drug store on the other corner will adopt that same price.

Similarly you go down the street and look at the grocery stores along in a row. If you see that one is sell-
2611 ing 3 heads of lettuce for 25¢, it won't be long until they all adopted that same price for the same kind of lettuce.

The retailers are so much concerned, to be sure that their prices are not higher than other people's prices, that they go to great lengths to make sure that that is not the case. The average large department store maintains a number of so-called shoppers, who do nothing but go around to different stores, comparing the prices at those other stores with the price of the store for which they work, just to make sure that no one is under-selling them for similar merchandise.

And it is not uncommon, as you know, for stores to have a public slogan, "We will not be undersold."

The only difference I can see in the oil business is that the time element in which the change is—by which they all arrive at the same price, is much shorter, due to the fact of the necessity of information leaking out about the price change coming along with all the stations right out on the street, so to speak, with the signs right there where everyone can see them; and so when one price changes, they all change very soon, and that may be a little quicker than it happens in some other lines. The principle is exactly the same as in all competitive business, I would say.

The mobility of the car is another factor that
2612 accentuates uniformity. For instance, even though you know there is a cutrate drugstore downtown, if

you live in the suburb ordinarily you will buy at the neighborhood drugstore if there isn't too much difference as it is too inconvenient to go downtown.

But now, when you are in an automobile—and you are necessarily driving around anyway—you are going to pass a number of stations, and it is not inconvenient for you to stop in at the one that has the cut price rather than the one that has the high price. We all know that there are plenty of gasoline stations. I would say that the flow of patronage in the retail gasoline market was extremely sensitive and responsive to variations in price.

We must remember that the demand for gasoline, after all, is what economists would call a derived demand—secondary demand. What we really want is transportation. You want to get your car to move. You don't buy gasoline to drink or to look at or to wear. You buy it to put in your car, so that you are not willing to pay very much more. Ordinarily, other things being equal, you are not willing to pay any more for the kind of gasoline that you prefer. If the man who sells the kind of gasoline you want wants to charge you a higher price for it, you will say, "Well, I will go across the street and buy it from the other fellow."

2613 And you must remember, too, that the average purchase of gasoline is only a few gallons, and that you might possibly prefer the gasoline that is selling at a higher price; but if you did patronize the price cutter and found that the gasoline didn't work quite as well—it would be gone in a day or two, and your tank would be empty, and then you could resume your normal source of supply. So that there is very little resistance to trying out a cut price product. It isn't like buying a necktie that you will have to wear for the next 5 years, or a pair of shoes that might not fit. You don't care. You are not willing to pay very much, in fact, hardly any more for the product you prefer than for any other product. The whole business is an illustration of that, you might say. I have been at pains to look up a few special cases where there were differences in price that made it possible to study just what went on. Two or three examples come to my mind.

One of them was the study I made of the situation out in California. There is crude oil production right in the city of Los Angeles and a number of small refineries and cut price marketing is rather prevalent there.

I took a period in 1933, when, during the months of April, May and June, I got the tax figures from the State of California, by companies, and I took the figures 2614 for the 7 major companies who constituted the largest part of what we call the major company operations in California; and then I deducted that from the total and got the rest of them which, you might say, represented the low price sellers.

Well, in the quarter I speak of—April, May and June—the prices of the two groups were about as near as they ever got together. They were roughly on a parity because competition had been pretty keen there, and they had what they called a price war that had brought all prices within reasonable parity with each other, so that you might say that they were all selling at about the same level. In that quarter those 7 major companies did 81% of the business in California. Then the price separated again. The cut price marketers began to sell at lower prices, and I believe that most of the 7 major companies had an increase in price, so that the variation spread out, and I don't know just what the variation might have been. It was probably as much as 2¢ or 3¢ a gallon, at times.

But for the second quarter, which this study covered—July, August and September of that year—the sales of these 7 major companies who had sold 81% of the business in California in the previous quarter, dropped to 66% of the business of California. In other words, dropped from 81% to 66% within a period of 3 months.

2615 The Court: Q. During that time they maintained their price; they didn't cut their price?

A. Well, the price of the major companies and the price of the other groups came farther and farther apart. I think it was the function of both.

By Mr. Donovan

In other words, the cut price marketers, I would say, dropped their prices further, I believe, and at the very beginning of this period the major companies had advanced their price, I suppose, in the hope that they might be able to stabilize things or for whatever reason they did advance the price. And the cut price marketers stayed down, and possibly went farther down, so that at any rate the price of the two groups came to be farther and farther apart.

What the effect upon the patronage was is marked, as I have mentioned.

Now, then, if you think what happened to the other group, you will realize that they increased from 19% to 34%. In other words, they almost doubled their business.

There is a very startling example in our own company's experience in the City of Columbus, Ohio. We, of course, have a number of service stations in Columbus, one
2616 of the large cities in Ohio—and I will have to make
sure what period that covered. I believe it was 1932.

A track-side station is a cut price marketer, who sets up a service station along the junction of a railroad track and a leading highway—opened up a station which happened to be just across the street from a station that we had on that same railroad track, and he started to cut the price.

Well, we didn't feel that we wanted to try to meet that price all over the City of Columbus but we did decide to just meet it at that one station that we had across the street, so that we simply adopted his price—whatever price he charged, we charged; and that meant that our prices at the station that we had became a good deal lower than the prices at the rest of our stations in Columbus.

In April—just to give you an idea of what the normal volume of the station was—we sold 8,254 gallons in that station, just an ordinary moderate-sized service station. In May we began to meet the price changes of the marketer across the street, and the business at our station increased from 8,000 in the previous month to 24,696 gallons in the month of May, when we started this experiment. In the next month, June, that gallonage increased to 261,350.

2617 Now, I think that illustrates as dramatically as any-
thing could the attraction of the lower price for gasoline. It was exactly the same kind of gasoline that we were selling in every other station in Columbus, exactly the same kind of service—in fact, the service was much poorer, because people were lining up for a block to get in and buy. So that from any standpoint of convenience, it had a great disadvantage to the customer.

As to what the price differential was, how far the cut price was below the normal price, I tried to get that information, expecting someone might be curious about it, but, as a matter of fact, we don't know exactly what it was. I wasn't able to get the information, I am sorry to say, but we simply adopted the price of the man across the street, and whatever price he chose we chose. I would say the price was at least 1¢ or 2¢, probably around 1½¢ or 2¢, below the level of the surrounding stations. We discontinued the experiment in June. In July, it dropped from 45,000 back to the normal level, about 9,000 gallons.

You see we couldn't continue that. We hadn't expected it would have such a drastic effect as that and our dealers in the rest of the town were losing their gallonage to this one station, and it wouldn't be fair to them to throw it all to this one station. But it illustrates the sensitiveness of patronage to changes in price.

Another example of that is ethyl gasoline. Two years ago people were buying ethyl because they thought it was
2618 necessary for their cars, as it was then, before the
regular grade was improved. Now we know ethyl is better in practically any car, but when regular grade is brought up to the point where it is satisfactory, very few people are willing now to pay the extra 2¢ for ethyl gasoline, which shows the sensitiveness of patronage to price. Our sales of ethyl gasoline used to be almost 50%. Now they are almost negligible.

Another illustration comes to my mind in the case with some stations we had in the northern part of Toledo, Ohio. Now, Toledo, Ohio, as you know, is right at the northern edge of the state of Ohio, as you enter Michigan. The Michigan line is just a few miles above Toledo, and Detroit is about 55 or 60 miles north of Toledo.

Now, during 1931 and 1932, there began to be some very serious price wars in Detroit. Gasoline would come all the way from Rumania into Detroit, and there was a general depression in the Detroit prices that got more and more pronounced as compared with normal prices in the surrounding area. And our men in those stations on the north side of Toledo—we had 3 stations that were on the main highway from Toledo to Detroit, and where sales were primarly to people who were driving through. The boys in these stations began to complain that customers were not buying there, they were waiting until they got into Detroit, 55 or 60 miles away, but still they were
2619 waiting. Likewise when anyone came from Detroit
they would fill up there; instead of stopping in Toledo to buy, they would get all the gasoline they could hold in Detroit.

I was interested to see what happened in those stations. So I got the figures for those 3 stations.

In 1930, before this disturbance started, these stations did a certain average gallonage. Figures are of no particular importance, but the next year the sales of those 3 stations—this is 1931, and the price wars in Detroit had just begun to get under way—and the sales in those 3 stations in Toledo in 1931 dropped 12% below 1930.

Now, you may say, "Well, that is maybe just the depression in general." But that is not the case, because we sold more, I think as a whole, in the year 1931 over 1930, and so did the typical highway stations around the state. So we lost 12% in 1931, drawn into an area of 60 miles.

In 1932, the sales at those stations had dropped to 39% below 1930. In 1932 we did have a little general decline in gallonage but it didn't amount to more than 5% or 6%. At least 34% or 35% of this 39% was a shift of gallonage out of our stations into the Detroit area.

This sensitivity of the gasoline market has the effect of making gasoline prices very realistic. Nobody could expect to get away with a very much higher price,
2620 not any higher price than the competition would warrant, because the minute that they did and someone cut that price, the effect through the loss of gallonage would be immediate and drastic, and to hold their business they would have to put their price down to the level of the competitors selling other similar goods.

I suppose it is impossible to give an absolute figure, but I would say a very small percentage, 10% to 15% of total gasoline sales made at the low prices would be sufficient to keep the price of the market as a whole down to a realistic level that I speak of. When I speak of "realistic" I mean right down to earth.

This sensitiveness of the market applies also to the wholesale market, and I should say that the wholesale markets were even more sensitive to price changes than the retail market is, because a jobber, for example, might likely shift his patronage for as little as 1/8¢ a gallon change in price between one supplier and another. He is naturally concerned with larger quantities, and a small change would be very influential with him.

The retail price of gasoline has a very direct effect on the tank car or wholesale price. If the retail price is depressed it would have a direct tendency, both direct and indirect, of depressing that tank car price.

Suppose that a retail price has been cut in a certain locality. The other retailers have got to meet that
2621 price cut as we have just seen. If they do not, they will lose their business. That means that the companies supplying those dealers, to take the first of them, must cut their dealer prices, and when the dealer price is cut the jobber finds himself with a narrower margin. Various provisions of contracts, and where there are no particular provisions the supplying company would in any event, tend to protect that jobber by lowering the price to

that jobber. Well, the jobber price is the tank car price, and through that chain of the retail price crushing down the dealer price, and the dealer price crushing down the jobber price, you have a direct effect upon your tank car price. If the price to the jobber is depressed the tank car prices are bound to be depressed.

Now there are some contracts—some contracts specify the jobber price will be a certain amount, a definite, fixed amount under the retail price in the area, or in the general area, and in those cases the jobber price just automatically goes down with the reduction in the retail price. That type of contract is not so prevalent as it was at one time, but practically all the contracts have some provision that makes the jobber price responsive to changes in the retail price.

Where a jobber or dealer has a contract with his supplier the retail price still affects the wholesale price because even though the contract gave the jobber the
2622 right to charge a higher price, or continue charging the same price even though retail prices had gone down, it would not be practicable for the supplier of that jobber to try to maintain that position and those prices.

Suppose the retail price went down 2¢ a gallon so that it would absolutely wipe out the jobber's margin on sales to dealers. Of course a jobber could not continue in business at no margin and the supplier wanting to have distribution in that area would naturally give his jobber a price that would enable that jobber to stay in the business and compete. Now, he might not give the jobber full protection, by cutting the jobber's price to the full extent the retail price had been cut,—but the tendency would be inevitably for the jobber prices to go down on reductions in the retail and the tank car prices.

If one refiner makes a price concession to his jobber that indeed affects the other refiners. Let us suppose that one supplier makes a concession to his jobber. Now, the next supplier's jobber comes to him and says, "I want you to give me the same kind of a price protection that the other company gave its jobbers, my competitors." Well, if the supplier did not give his jobber reasonable protection, when that jobber came to renew his contract he would not be in a very good frame of mind. So in order to keep in relationship with a jobbing account a supplier must and naturally does take care of trying to protect him
2623 during the times when the retail price would be reduced.

So I think there is not any question but that the sharp reduction in the retail price would affect the jobber price and the tank car price generally.

I think I made some approximations of percentages of use by the various consumers that were not right down to the last decimal point. In accounting for the 100% I have gotten some figures that I did not have with me this morning, and I will read those to give the actual breakdown which I was referring to as nearly as I could then recollect it.

The passenger cars represented 60%, trucks represented 27.4%, busses represented 2.9%, taxicabs 2.2%, aviation, motor boats and railroads .5%, agriculture 3.3%, and the balance, representing miscellaneous contractors, government agencies and the like 3.7%. That makes a total of 100%. I said that those figures were—perhaps the aviation especially would be somewhat higher now, and correspondingly some other figure would be somewhat lower; but those are the figures I have compiled.

(Indictment handed to the witness.)

The question which you asked me, as I understand it, is whether, assuming the truth of the allegations of the indictment, paragraph 6, p. 8, lines 12 through 23; p. 9, lines 2-8; paragraph 12, p. 13, lines 1-4; paragraph 16, p. 14, lines 29-31; p. 14, lines 1-5; paragraph 16, p.
2624 15, lines 6-15; paragraphs 18, 20 and 22, these defendants, assumed to manufacture around 85% of the gasoline consumed in the Mid-Western area, could have raised the prices in these tank car markets and the prices in the marketing territory itself, to artificially high and non-competitive levels, I believe is what the term is. I do not think they could have. My answer is that in my opinion they could not. Because if they did what you ask me to assume, that is, agreed to establish artificially high and non-competitive price levels, gasoline would immediately begin to flow into this area from refineries, some of whom are already located in the area, that are not in the group of defendants or alleged co-conspirators, but who have refineries in this area. In addition, there would come into the area gasoline from refining companies whose refineries are located outside the normal sources of supply, that are shipped into this area. In other words, there are a good many areas outside of this particular one that supply the territory.

Another way I think we could put it is this: That it is a good deal like a dike. Suppose that you build a dike along the banks of a river, and you extend it only

85% of the distance along the said stream or lake; it would not be possible with such a dike to maintain the water in that stream above its normal level. Nothing but a dike that extended substantially the entire distance 2625 and was maintained in that position would be sufficient to hold the waters in that stream or lake above its normal level. Just so, if only those representing 85% of the market attempt to do something along the lines you have suggested, raising the price to artificial heights, they just wouldn't be successful. If the group sold less than 75% instead of 85%, that would not change my answer, in principle. It would merely make the conclusion more obvious, just as if the dike extended only 50% of the way, it would be even more apparent that it wouldn't be able to hold the water up.

I am familiar with the names of the defendants in this case. I know it is a fact that a portion of the gasoline sold in the Mid-Western area by companies other than these defendants is sold under contracts to jobbers. I believe that some of the companies who are not mentioned in this list of defendants do market in this territory to jobbers under contracts. I don't know what proportion, but I know that it is a substantial proportion.

We do business in Michigan and Indiana; but, quite apart from that, I do know in general the ways in which these various companies conduct their marketing. For example, National Refining Company is one of the companies not included in this indictment. It has its offices in Cleveland, and I know their president and the man in charge of their sales. Ohio Oil Company is another 2626 of the large companies that is not a defendant here, and I know the sales manager of that company. I have talked to him from time to time, and I have a general knowledge of the way in which they do business in this territory.

I make it a part of my business to keep informed about what my competitors are doing. I think that a good many of these contracts have price clauses of the general nature as that described in paragraph 11 of the indictment in this case.

If an arbitrary tank car price for gasoline which was above the cost of manufacture was set, there would be a definite tendency for refiners to sell gasoline on contract to jobbers at a lower price. Suppose such a price has been fixed, as I have been asked to assume, in other words, a high and artificial price. Now let's suppose that I am an independent refiner, that I am not in this alleged conspiracy and some one has raised the price up to an artificial level. It is certainly a fine opportunity for me to increase my business—which is what I have been wanting to do, it is fair to assume, for a good, long time—and I would naturally try to take advantage of this situation and increase my business, sign up some more jobbers, and perhaps offer them a little wider margin. And I might even build some service stations, and cut the service station price.

There are all sorts of ways of cutting the price,
2627 indirectly, as well as directly.

I could give the jobber wider advertising allowance. I could build some service stations and rent to him for a small amount, and things like that would be additional ways in which I could influence jobbers to come with me under such circumstances as we would assume; and I might even set up new accounts, and induce people to go into the jobbing business in view of the fine conditions that were being maintained by this conspiracy.

If that were done it would have a very noticeable effect on the tank car price very soon, because the minute that this process started, the companies that were in this alleged conspiracy would recognize the fact that they were losing their business; and I think it is quite obvious that shortly they would have to reduce their price in order to hold their business. We have seen what happens when a marketer is allowed to have a lower price than another, and the amount of gallonage that he can get as a result of that lower price.

Now, if you ask me to assume that an artificially high price is being maintained; and then we know there are plenty of people who would be glad to come into the area, it is perfectly obvious that they would just be handed the market on a silver platter, so to speak. That would still be true if the jobber customers of these defendants
were tied up in yearly contracts. I don't believe
2628 that would make any substantial difference. We
have to remember that these contracts are not all expiring at the same time.

In other words, let's suppose that I want to get some existing jobbers, who are now tied up with some other companies who are in this conspiracy. Well, I don't have to look very far before I find several jobbers whose contracts will be expiring in a week or two; and I can offer them a lower price or other inducements, and quite likely enable or persuade some of them to sign up with me.

Many of these contracts have cancellation clauses—

it is quite a common practice for a jobber contract to run for a year, and then to be extended thereafter from month to month, or with 30 days notice of cancellation, or 2 months or various practices.

Suffice it to say that at all times there are contracts expiring, or which are subject to cancellation on short notice; so that if the jobbers generally became aware that I, one of these refiners trying to get into the area and offering quite a nice deal to jobbers, was looking for jobbers, they would be coming around quite quickly. The fact that some of these non-defendant refiners sold gasoline under contract to jobbers would not eliminate them as potential or possible competition for these defendants.

The Court: Q. Do you know of any refiners in the East Texas field or the Oklahoma field, after 2629 April 1, 1935, that were carrying on the price war among themselves? Do you know of any of them that were really underselling others? Can you name any of them?

A. No. I wouldn't have any specific information on that particular point.

Q. Would the fact that the gasoline was allocated to these producers have anything to do with the possibility of fixing the artificial price?

A. There is no allocation of crude oil among refiners. There is nothing to stop a refiner from buying all the crude oil he wants.

Q. Where, in those fields?

A. Oh, no, anywhere.

Q. I am talking about those fields?

A. Well, not in those fields, there never has been to my knowledge.

Q. That is allocated, isn't it?

A. No, sir, the crude oil is not apportioned out among the refiners.

Q. No, but isn't there a limit on how much crude oil they may produce?

A. There is a limit on how much crude oil the producers may produce.

Q. That is what I mean.

A. But that does not, in my opinion, limit the 2630 amount of crude oil that any refiner could obtain to refine in his plant.

Q. And make a profit?

A. Well, the question of the profit would depend upon what his selling price was. Now, if some one was holding up an umbrella for him, as I have been asked to assume, of course, the profit would follow. In other words, if someone was holding up a nice, high price, it would be easy to make a nice profit.

Q. Where would they get their supplies of crude oil, down in Texas and Oklahoma?

A. They would get it from the sellers of crude.

Q. From what fields?

A. Well, practically all the fields are interconnected with various pipe lines.

Q. In what states?

A. In the states of Oklahoma, Kansas, Louisiana, Arizona and Texas; and also those pipe lines, I think some of them go clear out into New Mexico; and they even go up into Wyoming. There is a pipe line from Wyoming clear down to Kansas City.

Q. Would you think it was safe to assume that most of the crude oil that goes to those refineries in Texas and Oklahoma is furnished from the fields in Texas and Oklahoma?

A. Yes, I should say so.

2631 *By Mr. Donovan*

The apportionment of proration in the various states has a relation to demand. The allowable production in each state is arrived at by the state commission or body—in Texas, it is the Texas Railroad Commission; in Oklahoma, I believe it is the Oklahoma Corporation Commission; and in Kansas, I think it is the Conservation Commission. But suffice it to say that in each state there is a body which has as its duty the determination of how much crude oil should be produced in that state for each given month.

Now, they arrive at that figure by giving consideration to the so-called nominations, that is, the estimates on the part of different refiners as to how much crude they would be willing to buy or how much they want for that month. That evidence is brought before the Commission, and on the basis of that and other facts that they may have, they finally arrive at a figure as to how much crude production there shall be allowed in that state in that month. Then they apportion that among the different pools in the state.

Therefore, so far as the refiner is concerned, I would say that he is never in difficulty in getting plenty of crude. Our great problem for at least a generation, or at least 10 years and more in the oil business, has been the overproduction of crude oil; so that the problem is not for the refiner to find crude oil, but for the crude oil to find refiners.

2632 In addition to what he may purchase actually in the field, he has an opportunity of purchasing oil that may be in storage. As an immediate step, there is a great supply of oil in storage at all times, and there are many companies who are interested in selling crude oil to refiners, because they make a profit on doing so. They gather the oil from the producers, through their pipe lines that extend out to the wells, and they bring it into a central pipe line, from which pipe line they can deliver it to any one of many refiners. They get a satisfactory revenue for that that gives them an interest in trying to get the market of the small refiners as well as large ones.

I believe it can be said that no refiner would have any difficulty in obtaining a sufficient quantity of crude to make all the gasoline he wanted to make—subject only to his financial ability to buy the crude. Withdrawals from storage are not pro-rated any more, so far as I know. There was some attempt during the Code days to determine the amount that was to be withdrawn from storage. I think the Secretary of the Interior limited that at one time to, my recollection is, 100,000 barrels a day, but I wouldn't be sure of the figure. But there was a limit at one time.

I am familiar with the names of the 10 states referred to in this indictment as comprising the Standard of Indiana territory. There are a good many refineries outside of these 10 states which ship gasoline into this Mid-
2633 western area. Generally, the areas, outside of the Indiana territory, from which gasoline moves into that territory are: the Oklahoma area, which is the Group 3, so-called.

Then there is the Louisiana—the northern Louisiana and Arkansas, which is often spoken of as the Arkansas and Louisiana Inland. In other words, right practically along the borderline between Louisiana and Arkansas there has been a lot of crude oil discovered, and there is quite a refining center in there. In northern Texas, there is another considerable refining area.

In addition to those, which I believe are thought of as the normal source of supply for this area, there are quite a number of other refining areas close by,—some of them actually closer than those I have mentioned.

For example, at Toledo, Ohio, there are 4 refineries, and there is a refinery in both Lima and Findlay, Ohio.

Ohio borders Indiana and Toledo is near the western edge, so that those refineries I have just mentioned are practically on the edge of Indiana.

Going farther south, at Cincinnati, there are refineries both in Cincinnati and across the river, in Latonia, Kentucky—those are opposite Indiana, also.

Going down the Ohio River there is a refining center in Louisville, Kentucky, which is right across the river from Indiana—about opposite Evansville, Indiana, or, rather, it is farther north than that.

2634 According to the indictment, gasoline comes in the Mid-western area from Arkansas, North Louisiana, North and Eastern and Western Texas and Oklahoma. Freight rates definitely do not keep gasoline from Ohio, western Pennsylvania, Kentucky, south Louisiana, Central and Gulf Coast Texas, Montana and Wyoming out of this territory.

In fact the freight rates from some of these other refining areas I have mentioned to points in this territory are lower than the freight rates from the areas mentioned in the indictment.

For example, the freight rate from Louisville across the river into Indiana would be very small and, likewise, from Toledo, Ohio, to Detroit, for example, is a very small freight cost, compared with the cost of getting gasoline from Oklahoma up there.

The largest refining area in the world is down on the Gulf Coast. That is only a little ways beyond the areas that have been mentioned here of northern Texas.

In other words, that is the southern part of Texas and the Gulf Coast, and the freight rate from that area and from New Orleans, which is also in effect on the Gulf Coast, into this territory, is only a fraction of a cent higher than the rate from Oklahoma.

I have prepared a map which shows the general location of these areas and the Mid-western area.

(Map referred to is received in evidence as EXHIBIT 936.)

2635 Standard of Indiana territory is indicated by this light yellow color outlined in red and including the 10 states which we have just enumerated. These green areas are the several refining districts that we have just been talking about.

Here is Oklahoma which is commonly known in freight circles and in the trade as Group 3. That takes in all the refineries in Oklahoma for all practical purposes.

We have another group, the Fort Worth group, which includes the northern Panhandle, the northern part of Texas, and East Texas.

Then we have the El Dorado-Shreveport group. That is the Arkansas and Louisiana Inland, that I have mentioned, where the refineries lie along the borderline between Arkansas and Louisiana.

Here is a little group called the Waco group. Just a few refineries in there. The same is true of the Ranger group, where there is the Ranger crude field. Perhaps a few refineries there.

Then we come down to these important Gulf Coast groups. The San Antonio, which includes a number of the refineries in that area and in San Antonio.

Then, the Houston group.

Now, this is what we call the Gulf Coast, the largest refining area in the world, in terms of output. Most of those refineries are down at Port Arthur or at
2636 Houston, somewhere on tidewater, where ocean-going tankers can come and get that gasoline and haul it away.

And here is the New Orleans group, includes the refineries in the neighborhood of New Orleans itself, and also up the Mississippi a little ways. Baton Rouge, for example, is included in this area. The largest refinery in the area, I would say, is in Baton Rouge.

That describes the refining areas that are located in this big crude production section of the country.

I also mentioned the Toledo refining area. That is right adjacent to Detroit and Indiana.

Here is the Louisville area where there are a number of refineries and that, again, is right at the edge of this area.

Here is the oldest refining area in the country, the birthplace of the oil industry, over in western Pennsylvania. There they are still flourishing—not always flourishing, as we heard yesterday—a large number of small refiners, mostly engaged in the making of lubricating oil. That is their main purpose, because of the peculiar nature of the Pennsylvania crude. But they do make a great deal of gasoline, too. I think there are 25 or 30 of those refiners still operating and making gasoline every day.

Another of the large refining areas in the world is along the Atlantic seaboard. The shipments from the east-
2637 ern seaboard into this Mid-Western territory would normally come into Baltimore. It could come coastwise up the Chesapeake and it often does. Shipments from Bayonne, New Jersey, would not ordinarily come to Baltimore by way of Chesapeake Bay. I dare say some of them do. We have bought gasoline in Ohio, for example, from

the Humble Oil Company, where it was hauled all the way around by steamer, and shipped by rail from there to Ohio.

I have forgotten these refiners out in Montana and in Wyoming. There are substantial crude fields here, and it is becoming quite a refining center. There have been refiners there quite a time. There are more being built now, I believe.

I do not see any scale on this map, but I know enough about the geography of Ohio to tell you that would be about 50 miles to the inch.

In comparing the freight rates from one part of these areas with those from another part, for shipment into the Mid-Western area, Oklahoma is the most notable; that is Group 3. There are a lot of refineries spread over a good many places in Oklahoma, due to the fact that crude oil has been discovered in a good many places in Oklahoma; and I suppose the railroads, in serving these customers, have found it necessary to meet the competition of other railroads from different points. The result is that with the approval of the Interstate Commerce Commission it 2638 has been called a freight group, so that the rates from any point within this area to any point out here (indicating), say, in Illinois, are the same, no matter whether the refinery is located at Tulsa, or some other place farther west, we will say. It would not matter whether it was a little farther away or not. The rate from that refinery to the destination, let us say Chicago, would be the same. That is so there won't be any disadvantage to the refiner who happens to be a little farther away.

The same is true of all these areas designated as groups on Exhibit 936. In other areas such as Montana, Toledo and Pennsylvania, rates are not equalized.

These dots in the Indiana territory represent typical cities along the edges of the so-called Standard of Indiana territory. Those cities are Detroit, Michigan, Indianapolis, Indiana, St. Louis, Missouri, and Bismark, North Dakota. Each of those is an important city along the fringe of these areas. You might say Bismark isn't as important, but it is important in North Dakota where there aren't very many large cities. Those lines running from these refinery areas to those 4 dots represent the cost of shipping 1 gallon of gasoline from the various sources into the destination point.

(The witness describes the freight rates shown on Exhibit 926.)

2639 We haven't shown lines in Group 3, for the purpose of simplification.

As shown by Exhibit 936, gasoline can be shipped into Bismark more cheaply from Wyoming or Montana than it can be shipped into Bismark from Oklahoma.

These lines are different types. A solid line means that the rate is lower than the rate from Oklahoma to that point. A dash line means the rate is the same as from Oklahoma. A line constituted of dots and dashes means the rate is higher than from Oklahoma.

The rate to Indianapolis is the same from Eldorado and Shreveport as it is from Oklahoma, and it is the same from Baton Rouge or New Orleans as it is from Oklahoma. From Baltimore you can ship gasoline into Indianapolis at a lower rate per gallon than you can get it in from Oklahoma. From Toledo into Indianapolis the rate is 1.518¢, compared with 2.97¢ from Oklahoma. From Louisville the rate is less than 1¢ a gallon. The freight cost from western Pennsylvania to Indianapolis is just about 1¢ per gallon less than from Oklahoma.

The freight rate to Detroit is the same, 3.894¢ from the Oklahoma, Eldorado, Shreveport, Baton Rouge and New Orleans groups. But the rate from Toledo to Detroit is only .52¢ a gallon. The rate from Louisville to Detroit is 1.84¢ a gallon. You could ship gasoline from Baltimore into Detroit for 2.44¢ a gallon. I don't have the rate
2640 from East Texas to Detroit on this map. I could look that up and give it to you, but my impression is that it would be just a little bit higher, probably about .2¢ higher, than from Oklahoma, but that is merely my best recollection.

St. Louis has a rate from the Group 3 Oklahoma area of 2.17¢ per gallon. From this East Texas group the rate is .04¢ a gallon more, about 1/25¢, into St. Louis than from Oklahoma into St. Louis. It is actually cheaper to get gasoline from Eldorado and Shreveport group into St. Louis than it is to get it into St. Louis from Oklahoma. To get gasoline into St. Louis from the Gulf Coast, from Houston or Port Arthur or any of these big refinery points, it only costs about .07¢ more than from Oklahoma. From New Orleans to St. Louis the rate is less than from Oklahoma. In other words, it is 2.14 from New Orleans, as compared with 2.17 from Oklahoma.

At your request I have examined the amount of independent refinery capacity in Oklahoma, northern Louisiana, southern Arkansas, eastern and northern and western parts of Texas, the area mentioned in paragraph 6 of the indictment, and the Standard of Indiana territory which, in 1935 and 1936, was not controlled by any of the alleged conspirators in this case. My information is based on statistics gathered by the United States Bureau of Mines, which is now in the Department of the Interior. About every 2641 year they collect information on the capacity of each refinery in the United States, that is, how many barrels of crude a day it can run and also how many barrels a day it can crack. I believe the terms are already understood.

I have familiarized myself with the names of the companies which are still defendants in this case. In the area which has been mentioned as being the general source of supply for this territory, those companies still defendants had a refining capacity as of January 1, 1936, for the running of crude oil of 643,500 barrels per day operating capacity. That is their refining capacity in the areas that were mentioned in your indictment as being the normal source of supply for this territory. That is skimming, or crude distillation capacity. As for cracking capacity, they have an operating capacity of 436,470 barrels a day. You do not add these two together to get the total capacity. The best index to the total capacity would be the crude still capacity, this 643,500 barrels per day.

Mr. Donovan: Q. Now, what percentage was this of the total refinery capacity in the Mid-western area and in these outside districts from which, according to the indictment, the Mid-western area is supplied?

A. That constituted 56.8% of all the operating 2642 refining capacity in the area in question.

Q. When you say that, you mean the total straight run capacity?

A. Yes, the total straight run capacity and, of course, of the total cracking capacity as of January 1, 1936, these defendant companies had 65.1%.

The "area in question" is the area mentioned in the indictment—I mean the Standard of Indiana territory and 10 states, including the refineries, for example, in Chicago, and including also in the Oklahoma area; it included the north, central, and western Texas—and eastern Texas area. I believe it was called the western, central and eastern parts of Texas. And it included the Eldorado and Shreveport area, and that is all.

Perhaps it would simplify it, if I would simply mention the different groups we have been considering here. We have considered the defendants in this case, who are now in the case, their capacity, and in the second place, we have taken those who are alleged to have been conspiring with the defendants—in other words, this group of independent refiners. That is No. 2. Now, No. 3, we take all the other independents who have refineries but who are not cited in the indictment as co-conspirators. In other words, the independents who were presumably alone in the conspiracy.

And, No. 4, we have taken the group of major com-
2643 panies who were not named as defendants or who are
not now defendants. Those who were named as defendants in this indictment, who are not now defendants, are assumed to be among the other major companies who are not now defendants. I believe Root and Lion were among the non-conspiring group. I took the list as I found it in the indictment on page 18. I have a list of names of those refiners in each group. Among these independent refiners who are not either defendants or mentioned as co-conspirators or alleged co-conspirators there are 5 in Arkansas.

I have the capacities of these companies available here. In Arkansas, these refineries consist of the Henry H. Cross Company at Smackover, having a refinery with a distillation capacity of 6,000 barrels and cracking capacity of 6,000 barrels. These figures are in terms of barrels per day and this is the number of 42 gallon barrels of crude oil in the first case, and of cracking stock in the second case, they can run through their refinery in one day.

I will try to describe the refining process.

A complete refinery consists of two units, a crude still, and cracking unit.

Now, those terms don't mean anything as such; but a crude still, that is the part of the refinery which does the original distillation of the crude, is just like a tea kettle;
in other words, you put the crude in, and you boil it.
2644 Distillation is merely the boiling off of the vapors.
Now, when you boil water, it all vaporizes at 212 degrees Fahrenheit, as you doubtless know.

Now, when you boil crude, however, some of it begins to vaporize at a very low temperature; at under 100 degrees, the gasoline will begin to come off. Crude oil is not like water. It consists of a lot of different mixtures, some of which boil off at one temperature, and some of which boil off at another. The trick is to catch these different vapors as they come off.

You first boil up to a certain temperature, and all the gasoline comes off. You collect that and condense it, and you have gasoline. Then you boil it some more, and you get kerosene, in a higher temperature range. And then, when you get that off, or as much as you want, you boil it some more, and you get what we call heating oils; which are the oils that you may burn in your furnace at home, if you burn furnace oil.

Now, we have left in the bottom of the still a lot of heavy, pitchy stuff which is called reduced crude, or tar. We sell it for road oil, or we make asphalt out of it.

In the range of distillation below the kerosene, ordinarily the refiner has no use for as much of that as he would ordinarily get. To give you some idea of what these percentages are, the gasoline which would just come off in the way I have described would be around 25 to 30%; then 2645 the kerosene would be perhaps 10%, but nobody could sell 10% of kerosene, so they don't use that all as kerosene. They hold that in reserve. And the same with this distillate that I have mentioned as being suitable for burning in your furnace; there isn't a market for all of that type of material that could be made from the straight distillation of crude. In fact, about 40% of your barrel of crude will be in that range of stuff that you do not have a market for as such. Now, that is where cracking comes in.

You don't take the best part of the gasoline and crack it, and you don't take this heavy stuff and crack it. You take the stuff in between to a unit called a cracking plant, and turn it into other products, the leading one of which is gasoline. Now, a molecular change takes place under the influence of high temperatures and great pressures, and it turns part of this kerosene and furnace oil into gasoline. The residue is again a heavy pitchy substance called cracking oil, or cracking residue; which, in turn, is sold for heavy fuel oil, and for steel plants and that sort of thing, or it may be reduced to petroleum coke.

Some refiners do not have cracking equipment. They simply take the crude and make the combinations that they can get in the crude stills. If they have an excess of kerosene and gas oil, which is what the charging stock is 2646 called for the cracking equipment, they sell that to some concern that does have cracking equipment. Or they may sell a larger percentage of that particular type of material as kerosene, or as tractor distillate, or furnace oil. There is a market for it. They can sell it all, but it pays some refiners to crack up that stuff.

I find that on January 1, 1936 this group of independent refiners who were not included among the defendants or among those alleged co-conspirators and who were named in the indictment had a refining operating capacity of 183,450 barrels per day, and a cracking capacity of 57,600 barrels per day. That was in operation.

You will notice there are two designations. One is operating, and we have not come to the other. Some of the capacity is shut down from time to time, and these refineries when they are made up list the capacity as being operating or shut down, and I am now talking about the capacity that was being operated. All these figures are in barrels of 42 gallons, per day. By capacity being operated, I mean capacity of plants that were in operation. I am quite sure that is the definition of the Bureau of Mines.

In 1935 that same group of refiners had an operating capacity of 183,450 barrels per day. That is the same figure as a matter of fact. They apparently had not changed. It is quite reasonable to suppose that they did not change
during the year. There was not much refinery capacity
2647 being built in that particular year, I would say.

The cracking capacity of that group as of the beginning of 1935 was 51,400 barrels per day.

There are 2 groups of independents; those who are not mentioned as having been alleged co-conspirators, and those that were so mentioned. We will consider the percentage of those who were not mentioned in the indictment to the total of the 2 groups, that is, of all independents.

Taking both groups together, the crude distillation refining capacity of the independent group not named as co-conspirators was 62.4% of the total crude distillation refining capacity of all independent refiners in the same territory in 1935; on cracking the percentage in 1935 was 55.3%. In 1936 the percentage for the crude distillation was 56.85%, the cracking was 46.95% of the total. That is the percentage of the capacity of the independent refiners who were not mentioned as co-conspirators to the total capacity of all independents. Some of this independent capacity was actually inside the Mid-Western area, in the 10 states. In the states of Illinois, Indiana, Kansas and Michigan these other independents had 59,150 barrels capacity per day of crude distillation at the beginning of 1936, and of the cracking capacity they had 14,000 barrels per day operating capacity. These refiners had a competitive advantage over the Oklahoma and Texas refiners. I should say that
on the whole they would be nearer to the market. We
2648 are talking about the ones outside the area. They
would have some advantage on that account.

Q. In the indictment, it is charged that the defendants bought about 50% of the production of the alleged co-conspirator independents. Now, I ask you to assume that is true, and ask you to state to the

Court and to the jury whether, if 56.85% of the independent refinery capacity were not in the alleged combination; and, second, a substantial proportion of that percentage was located nearer to market than the alleged co-conspirators; and, third, that the defendants bought only 50% of the production of these independents who were alleged co-conspirators; whether it would be possible for these defendants to fix and maintain a price?

A. No, I do not believe it would.

I believe the capacity that we have been considering; that is, half of the capacity of the independents who were alleged to be co-conspirators, but half of whose gasoline was being purchased, as I am asked to assume, plus all the gasoline of the other—or a large part, at any rate, of the gasoline of this other group, which had a large refining capacity, as I have mentioned, would be sufficient to invade this area and prevent an arbitrary fixed price being maintained. I would certainly say that if the major com-
2649 panies, if the defendant companies only bought 15%
instead of 50% then it would be more obvious that they could not hold an arbitrary fixed, high price.

There were independent refineries in these refining areas named in the indictment, and in the Mid-Western area, which were not owned by a defendant or alleged co-conspirator company, which in 1936 were shut down. The capacity of the same type of independent refiner, not included in the indictment, that was shut down at that particular time—January 1, 1935, those refiners had 142,250 barrels of crude distillation capacity, and they had 19,850 barrels of capacity to crack. That was either the plants that were not operating at all, or it was part of the plants that may have been operating some of their equipment, and some of it they were not operating. In any case, this is the part of the plants or the plants as a whole that were shut down at that particular time. I got that information also from the Bureau of Mines reports. They were not included in these other figures I gave. This is additional capacity.

Q. Now, would shut-down refineries be a market factor if an attempt were made to fix and maintain an artificial price?

A. I should certainly say yes.

Mr. Lewin: Now wait—I object to that. I think the question would have to be "if an attempt was
2650 made to fix a certain price"—fix a certain price, be-
cause certainly idle refineries wouldn't come into

operation simply because one price is fixed. It might be a price that was fixed below their cost of operation. It might be a particular type, with a particular reason for being shut down. They must be shut down for some cause. They may be inefficient, and that may be the cause. Something has got to attract them to come into operation. This witness can't be permitted to say that those companies are going to come into operation, regardless of the price fixed.

The Court: I don't think we ought to give any consideration to anything except actual plants operating at that time. Your motion to strike is granted.

Mr. Donovan: And I may have an exception to that?

The Court: Yes.

By Mr. Donovan

It is true that a number of the refiners that I inquired into in making my estimate here, produced only third grade gasoline. These refiners which produce only third grade gasoline would have to be considered as potential competitors for those defendants whose main business is the selling of house brand gasoline. All grades of gasoline are
2651 interrelated, and if the price of one grade of gasoline
became very low, relative to the others, it would inevitably attract business from those other grades to the lower priced grades. Suppose that I come into Madison, Ohio, with a service station, and I am selling a grade of gasoline that is not 70 octane, that is not quite as high as the regular house brand; it is something less than that; but I cut the price very substantially. I will get a great deal of business from people who, if the price were the same, would be buying the regular grade; because, after all, they are willing to take a little less perfect performance in their car for a certain saving of money. Just so the average buyer today, even though he could get a little better performance from the use of ethyl gasoline, is not willing to pay the 2¢ extra for it, and buys the regular. And if the price of third grade got substantially below the price of regular, he would turn to that, and if his motor knocked a little it wouldn't knock him out of the car.

I think I can illustrate that a little further. There are about 28,000,000 cars in this country, which is a car for every 5 or 6 people. That means there are all kinds of buyers of gasoline. Some people who are on relief can hardly afford to buy anything; other people can afford to buy whatever they may want. But out of 28,000,000 people,

the majority are bound to be people to whom the price
2652 of gasoline is important, just as it is to most of us.

If the price of third grade gasoline were cut, they would be tempted to try it.

There were other refineries operating in these areas mentioned in the indictment, and in the Mid-Western area, which were not owned or affiliated with any alleged conspirator, other than the ones I have mentioned. There were a number of refineries in the area owned by what are called major companies, who are not defendants in this case. Taking them as a whole, they were operating refining facilities that had a capacity for crude distillation at the beginning of 1935 of 159,000 barrels per day. That is the straight-run, and they had a cracking capacity of 108,000 barrels per day. That is just in this same area that we are speaking of. And in 1936 those same major companies had refining capacity in this area of 159,000 barrels for crude oil; and 110,200 barrels per day for cracking. When I say "in this area," I mean that the refinery itself would be physically located either in the 10 states—Standard of Indiana territory—or in Oklahoma, the western, central or eastern part of Texas, or in the El Dorado-Shreveport area (indicating). These are the areas named in the indictment as being the ordinary source of supply for gasoline sold in these 10 states.

I have testified that in 1935 something over 60% of
2653 the independent refiner capacity in the indictment area
was not owned or affiliated with any defendant or alleged co-conspirator. I excluded from that computation all major refiners, whether defendants or not.

These 2 groups, independents and majors not defendants, or alleged co-conspirators, which were situated in the Mid-Western area and the refinery districts which, according to the indictment, supplied it, had a total capacity of 345,600 barrels per day, crude still. And 167,900 barrels per day of cracking capacity as of January 1, 1936. For 1935, the comparable figures for the crude still capacity were 342,450 barrels per day; and for the cracking, they were 159,400 barrels per day.

Of the straight run capacity which was owned by the defendants and alleged co-conspirators, that leaves at the beginning of 1935, 68.3% and for 1936, 69.4% of the crude still capacity. I don't have the percentages worked out on the cracking. I can probably estimate it here if you want it.

At the beginning of 1935, these two groups had 448,994 barrels of cracking capacity, and at the beginning of 1936, 501,670 barrels. I don't have the percentage worked out

for these 2 years, but the total to which those figures should be related would be 608,394 for the beginning of 1935; and the beginning of 1936, 669,570. It would be a very much
larger percentage than the 68 and 69. I think the
2654 major companies, who were among the defendants,
tend to have a larger percentage of cracking capacity than the independents.

(The witness makes calculations.)

I make it about 74.0% for 1935; and about 74.9% for 1936.

I do not believe that a combination with only those percentages of the total refinery capacity in the area we are talking about could maintain arbitrarily high prices for gasoline in this area. Because the capacity of the other group would have been, in the case of crude distillation capacity, about 31% and in the case of cracking capacity, about 25% to 26%.. And I believe that those percentages of the capacity that was being operated in the area would be sufficient to prevent any artificially high prices being maintained, because those companies would be very glad to increase their operations in this area. I think that can be assumed from the very nature of the business.

There were refineries from other areas supplying this territory during 1935 and 1936. There were refiners in Toledo, who were shipping into that area. There were refiners—I won't be able to tell you all the states into which they might be shipping. The movements of gasoline are not particularly secret, either within the industry or outside of it, for that matter. The state tax reports show the sales of all companies that do business in each state. And
I know enough about the individual companies' opera-
2655 tions to have some immediate knowledge of those
movements.

For example, I have here the state tax reports for the state of Michigan. And one of the companies I am going to mention is the Sun Oil Company, which has a refinery at Toledo.

The Sun Oil Company, the main office of which is in Philadelphia, does business in Michigan, and sells a great deal of gasoline there.

For example, in October, 1936, Sun Oil Company sold 5,227,013 gallons of gasoline in Michigan.

Sun Oil Company, I believe, gets most, if not all, of its gasoline that it sells in Michigan from the refinery it has right here in Toledo.

Now, I further know that Sun Oil Company owns an interest in a pipe line that was built for the sole purpose of transporting gasoline from Toledo into Detroit for it and certain other companies.

Another company which ships through that same pipe line is Gulf Refining Company, which also has a refinery in Toledo, Ohio. Gulf in October, 1936, it is reported in this tax report of the state of Michigan, shipped 3,933,685 gallons. I would say that a large part of it, if not all of it, was shipped from the refinery Gulf has at Toledo.

Now, I don't want to go on record as saying that
2656 there might not be other gasoline that Gulf sells in Michigan than that which is shipped in from Toledo; but I think it is reasonable to suppose that a very large percentage of it is, because that is the place they set up to refine gasoline for that area, and they have gone to the trouble of participating in a pipe line to get the gasoline there.

Our own company is a third example of a company having a refinery in Toledo which ships gasoline into Michigan; and all the gasoline, practically, that we sell in Detroit is shipped in there from Toledo. We ship into Indiana also; I would say a large part of the gasoline we sell in Indiana is shipped in from the refinery we have in Toledo. We also have a refinery at Lima, Ohio, which is about 70 or 80 miles south of Toledo, and we make some shipments to some points in Indiana from that refinery.

Now, coming down the line: These western Pennsylvania refiners. I can't give you specific refineries that have made specific shipments to particular points there.

I have some records for the state of Indiana. Aetna Oil Company of Louisville, Kentucky, is listed as one of those selling gasoline in Indiana, and I happen to know that that company has a refinery in Louisville. The Texas Company has a refinery within the area and also outside the
2657 area.

I have mentioned the three of them in Toledo, and I mentioned the Louisville refiners in the Kentucky area. The Gulf Oil Company has a refinery in Cincinnati, Ohio. Cincinnati is at the junction of Ohio and Indiana along the Ohio River and within a few miles of the Indiana border. I think, strictly speaking, Gulf's refinery is at Hooven, a suburb of Cincinnati.

We own a company which has a refinery at Covington, Kentucky, which is just across the river from Cincinnati. It so happens that we bought out an existing refinery there some years ago. So we have a plant there on the Kentucky side. That covers Kentucky and Ohio.

I have given the western Pennsylvania refineries as being among those who ship into this area from time to time.

Mr. Chaffetz: Q. In negligible quantities, would you say?

A. I would say they varied with the rate and prices in the two zones. Sometimes it is quite substantial.

By Mr. Donovan

In Montana and Wyoming there are a number of refineries which ship into the western part of the Dakotas.

2658 The National Refining Company has, I believe, two refineries that are involved in the picture. One of them is, I think, at Coffeyville, Kansas, just right inside the area, and one is at Findlay, Ohio, which is about 50 miles south of Toledo, within a few miles of the Indiana border. It sells to the Mid-Western area.

The Texas Company I have mentioned. It has a refinery at Lawrenceville, Illinois, and one at Lockport, Illinois, which is on the Illinois River waterway, between the Great Lakes and the Mississippi. And it has a third refinery at Pryse, in the eastern part of Kentucky.

The Ohio Oil Company has a refinery at Robinson, Illinois, within the territory. That is near Lawrenceville, where I mentioned The Texas Company was. I think Marathon Oil Company, which is owned by Ohio Oil Company, has a refinery at Fort Worth. I should also add that The Texas Company has two refineries in Texas. And the Gulf Company has a refinery in the part of Texas that we have been including in this normal supply area. The Texas Company has a large refinery in West Tulsa, which is just outside of Tulsa. The Standard Oil of Louisiana has a refinery at Bossier City, in the northern part of Louisiana.

2659 Tide Water Oil Company has a refinery at Drumright, Oklahoma. And the Deep Rock Oil Company has a refinery in Oklahoma. It is one of the companies that is not included in the list of defendants or co-conspirators.

Standard of New Jersey, which owns Standard of Louisiana, began to market in St. Louis, Missouri, I believe, the latter part of 1934, or the early part of 1935. Now, I cannot testify how it got the gasoline to those stations at which it sold it in St. Louis. They have a large refinery at Baton Rouge, which is on the Mississippi River, and I do know the Standard Oil of New Jersey moved a tremendous quantity up the Mississippi. I don't know whether they moved any of that up from Baton Rouge to St. Louis.

There was some independent refinery capacity in the area I have just described outside the Mid-Western area during that period.

Q. And would you give us the figures for 1935 and 1936 on that refinery capacity?

A. Now, we are talking about refineries located in areas outside the ones which normally supply this territory.

Mr. Lewin: The question was outside the Mid-Western area, which is defined by the indictment.

A. Yes. Well, as of beginning 1935, there were 2660 companies which we have classified as independents, having a capacity of 160,175 barrels per day of crude oil, and a cracking capacity of 36,500 barrels daily.

Now, those were the refineries that are located in such as Louisiana, the Gulf coast, Montana, Kentucky, Ohio, and other parts of Texas.

The Court: Q. Did they ship into this area?

A. I was only testifying that there were independent refineries not connected with defendants or co-conspirators who had refineries located at those points we mention.

Mr. Lewin: I move to strike out the answer. I wonder if we might—if the witness might state whether or not this is offered to show that the price that was maintained wasn't high and arbitrary? If it is, then I say it is simply a quarrel with relative English. That is all it is. I don't see how that can help us. The fact that it is characterized as high and arbitrary. It means high and fixed. While it could be fixed by competition, part of it stayed out, what wasn't attracted in. The meaning of those words in the indictment as they have been construed 2661 by the Government applies to this particular case. I want to say one thing before I sit down, and that will be the end of it. I say that on the question of the definition of "high and arbitrary" we have now defined it. I do not believe anybody can use English that somebody else would not quarrel with. We have now defined it to be in numerals, and given the actual figures to which it went, in actual cents. We have also defined it as being higher than would have obtained if the conspiracy had not existed.

We have defined "arbitrary" to mean as a result of conspiracy, effected by a conspiracy.

Now, why quarrel any more about these terms? The terms mean nothing. The substance is here. Was the price defined in terms of cents that was level? We cite that here all through those months. Was that actually effected by combination? Now, that is the whole question. Now, why should we quarrel about whether it is high and arbitrary?

Mr. Dorr: I just want to take exception to the repeated remark of counsel for the government that the price was maintained. That I think is an improper statement for counsel for the government to
2662 make here.

Mr. Lewin: Your Honor, when the evidence shows the price rose and stayed there on that level during all that time I did not think there would be any quarrel between any of us. I did not think there would be any quarrel between anybody in this case that that price was not maintained by some force. Mr. Dorr thinks it was maintained by the Connally Act. I think he made a long argument along this line.

The Government maintains it was maintained by this conspiracy. How he can say there was any departure between our minds as to the fact that it was maintained, after all the evidence shows there was something there fixed, just as though it was a straight line, I do not understand.

Mr. Thomas: I object to the remark of counsel—

Mr. Dorr: I except to the remarks of counsel in the presence of the jury.

Mr. Thomas: That is not proper before the jury, and I object to it.

The Court: I hope the reporter is getting all of that—all talking at the same time. We are not going to allow this case to get away from us now.

2663 I have given some consideration to the question before the Court. While it is for the jury to determine whether or not the defendants had the power to fix a monopoly price, and did that actually during 1935 and 1936, fix the market price, nevertheless the defendants should be permitted to show what competitive price existed at that market, and the motion of the government to strike is overruled.

By Mr. Donovan

It is part of my duty in connection with my work for the Fleetwing Company, and in other connections of my work also, to be informed generally as to the sources of gasoline sold in competition with that which my company sells.

I think I have already testified that I know that gasoline comes into the Standard of Indiana territory from refiners in Toledo and Findlay, and I think I said Hooven. Hooven is the suburb of Cincinnati in which the Gulf's refinery is located.

I testified that the Kentucky Refineries around Louisville ship into the Mid-western area. I also testified on the basis of this general knowledge of mine that the refineries out in Wyoming and Montana ship into this area; into the western part of these northwestern states.

2664 I said at times refineries in western Pennsylvania did so ship into the Indiana territory.

Q. Can you tell the court and jury what was the total refining capacity in these areas, which capacity was not owned or associated with any alleged conspirator company?

A. Well, in the areas we have just been mentioning and referring to, the Gulf Coast areas of Texas and Louisiana, there was a capacity for crude distillation in 1935 of 230,000 barrels, and in 1936, 224,300 barrels per day.

The cracking capacity in those same districts was 101,000 barrels per day in 1935, and 95,200 barrels per day, in the beginning of 1936.

There was refinery capacity in the other parts of Texas and Louisiana which I have not already mentioned. The Gulf Coast region, I mentioned it by excluding it, but it was not included in the figures I just recited. The largest refinery district in the world, as I said yesterday, is the Gulf Coast region of Texas and Louisiana. More gasoline is made there than anywhere else in the world. That could be shipped into the Mid-Western area.

The total capacity of those refineries that have no connection with the defendants at the beginning of 1935 was 506,550 barrels of crude running capacity, and cracking capacity at that same date was 271,248 barrels a 2665 day.

Now in 1936 at the beginning of the year the crude running capacity of those refineries was 511,300 barrels per day, and the cracking capacity 298,448 barrels.

Q. Could you tell us whether or not this refinery capacity located on the margin of the Mid-Western area as you have already indicated on that map, Exhibit 936, would be a marked factor in the event that an attempt was made to fix and maintain an artificial non-competitive price?

A. Yes; in my opinion it would be very definitely a factor. If the prices were raised in the 10 states that are shown there outlined in red, the gasoline would tend to move in from the Gulf Coast area, very definitely, in my opinion.

That is because the freight rates, in the first place, are very little higher than the rates from the Oklahoma region. It is just a matter of a fraction of a cent. And furthermore, as we will see a little later, there is an excellent means of getting that gasoline into this territory by water up the Mississippi River.

(Referring to Exhibit 936.) This refinery capacity I speak of is along the Gulf Coast of Texas and Louisiana. You must remember that Texas is the largest oil-producing state in the United States, and that crude, generally speaking, comes down from—here is East Texas 2666 right in here (indicating) for example. There are pipe lines that run down from East Texas to this Gulf Coast refining section.

Here (indicating) is Houston. Pipe lines also come from out here in west Texas, even taking it from New Mexico, coming down here (indicating) to the Gulf Coast. And from here—there are even pipe lines that come up into Oklahoma, bringing crude down to these great refineries on the Gulf Coast, and there they get a happy combination of crude oil and water transportation, and that is why they are located there.

And there is a good market for fuel oil there. There is a large residue of crude oil, as I mentioned yesterday, which has to be sold for some purpose other than propelling automobiles. That amounts to around 25% of all the crude that is run, and it has got to be sold for heating purposes or power. These ports are very large ports. I believe Galveston, for example, is one of the largest ports in the United States, if not the largest, because so much cotton goes out from the Galveston port by boats. Most of these boats burn fuel oil, and that means there is a tremendous market for fuel oil on the Gulf Coast.

So as I say, that is a combination of water trans- 2667 portation and a market for fuel oil, cheap crude, and therefore it becomes the largest refinery center in the world.

Now, as we have seen, most of these refineries in these areas are owned by companies other than the defendants in this case.

The freight rates from this group—to take some specific examples again—into St. Louis, for example, the freight rate is 2.24¢ a gallon, whereas the freight rate from Oklahoma to St. Louis is 2.17¢ a gallon. Now, that is only

7/100¢ a gallon higher to ship from this point to St. Louis than from Oklahoma to St. Louis.

Therefore, it seems to me very obvious that a very slight rise in the price in this area would attract gasoline from here (indicating) which would come in almost as cheaply, a matter of 7/100¢ a gallon, about 1/15¢ a gallon extra over the cost.

Q. Well, would you or would you not say that this refinery capacity outside the Mid-western area in those refinery districts you have been describing would furnish competition for the Oklahoma refineries in case an attempt were made to set and maintain a price?

A. Yes, indeed I do.

I would say that the existence of the refinery capacity which I have just described and to which I have just 2668 referred on the map, would have a very decided effect in preventing the fixing of an artificially high price, because it is well known that that capacity is there, it is a common fact known in the oil business, and the ease of transportation is everywhere recognized, so that there would be no basis for assuming that it would not come in, because everybody in the oil business knows those are the facts. Perhaps I should not say "everybody in the oil business", but everybody who is concerned with these matters of prices in the Indiana territory would know that.

As I looked at that map I dealt with cities that were all around the area of the Mid-Western area like St. Louis and Indianapolis. That would not mean that the competition of those refineries I have described in Kentucky, Ohio, Pennsylvania, Montana and Wyoming would not affect prices in the heart of the area—for example, in Madison.

We chose those cities partly for two reasons, to see what happened to the rate around the edges, where the freight rates were less than from the Oklahoma points; and partly because we could not get so many points on one map.

For one thing, the first area that would be invaded would be undoubtedly the edges of the territory if an artificially high price were attempted. That would tend to force 2669 the gasoline that formerly supplied that entire area toward the center of the area, and it would pile up on top of what was already there and tend to drive down the prices in the center of the area.

But in addition to that same comparison of freight rates, that applies to the center of the area, so that there is both a direct and an indirect effect, both the effect of this edge pushing in to the center and driving it down from that side, and the invasion at the center itself.

I would say that the information with respect to the capacity of various plants that is in the documents handed to government counsel came from the same source that the summaries I have been reading from came from, and I have copies of the same information government counsel has, I believe. I would say that all of the figures I have used here are in these documents (indicating). They all came out of the Bureau of Mines reports, with certain supplementary information from the records of the Texas Railroad Commission concerning East Texas refineries.

This is a chart gotten up to show the same type information that was on the other chart, as to a city in the center. We picked Madison, Wisconsin, because it is centrally lo-
cated and would be familiar geographically to this
2670 region (indicating).

(Chart referred to received in evidence as EXHIBIT 937.)

The yellow area surrounded by a red line represents the Mid-Western area; and these green areas represent refining areas and refining sources of supply just as they did on the other map.

Here again we have the rail rates on tank car shipments from different refinery centers and sources of supply, to Madison, in cents per gallon.

(The witness describes the freight rates shown on Exhibit 937.)

If the price of gasoline in Madison were artificially raised, I would say the same thing that we have been talking about here before would happen. It would become an attractive territory for these groups that are outside, these refinery sources that are outside the usual, normal source of supply as mentioned in the indictment, and gasoline would tend to begin flowing into Madison from those areas.

I have examined the City of Chicago from a freight standpoint. The freight rates are very similar to those at Madison. It is not very far away, and to give just a very few examples, the rate from Oklahoma to Chicago is 2.44¢ a gallon. The same rate applies from the El Dorado-Shreveport area. From New Orleans, the rate is 2.54¢ a gallon;
from Louisville, 1.7¢; from Oil City, Pennsylvania,
2671 2.1¢; from Toledo, Ohio, 1.58¢. From this Fort Worth
area, and from East Texas, the rate would be 2.6¢ a gallon. So the rates to Chicago from these various groups are all within a small fraction of a cent of each other.

I would say it would require a very small increase in the price of gasoline to bring an increased flow of gasoline from these outside areas. With the rate from Houston to Chicago 2.6¢, and from Oklahoma 2.44¢, it is not difficult to see that a very small increase would yield a basis for shipments to commence moving from the Gulf Coast into Chicago.

I mentioned yesterday that we, in 1930, bought several million gallons of gasoline that originated down here on this Gulf Coast, came around by water to Baltimore, and was shipped in. During the years 1934 and 1935, there was a great deal of gasoline shipped into Ohio from Baltimore. I don't have the figures for a later period than that with me here, but I do know that in those years I speak of, a great deal of gasoline came in from Baltimore; and I would say that at all times there is a considerable quantity of gasoline shipped into Ohio from Baltimore. That could have an effect on the Mid-Western area. Indiana is just the next state over and it wouldn't be much farther to come from Baltimore into this territory than into Ohio,
2672 just one state removed.

Now, I don't know that gasoline doesn't come from Baltimore into this area; I say that I should doubt that a great deal of it comes typically. I wouldn't say it would be a very extreme case if it were to come into the Mid-Western area, because the freight rate from Baltimore to Chicago, for example, is only 2.83¢ a gallon; that is .39¢, or a little over ⅓¢, more than it is from Oklahoma.

The Bureau of Mines figures cover Pennsylvania, but it doesn't have it separate, that is, the production of gasoline; but the refinery capacity in Pennsylvania as of January 1, 1936, totaled 310,475 barrels of crude. I would say that 50% of that crude would be turned into gasoline on the average, or 150,000 barrels a day. I am giving capacity and not actual runs, I don't have the actual runs. I would say—I don't have the consumption here in Pennsylvania, but from my general knowledge of the state, I would think it would be—oh, 1,250,000.000 gallons a year, of gasoline. That is about 4,000,000 gallons or 100,000 barrels a day.

(Exhibit 726 is produced and handed to the witness.)

The Witness: Well, we have the figures here; I had better verify this supposition I made.

(Examining Exhibit 726.)

2673 Well, I said 1,250,000,000, and it actually is 1,177,000,000, so it is substantially correct.

I testified yesterday that according to the Bureau of Mines' reports there was a shutdown in the independent refinery capacity in the Mid-Western area amounting to 142,250 barrels as of January 1, 1935. The fact that a refinery was shut down January 1, 1935, would be an indication that it did not operate during the balance of the year. Those figures are as of a different date. It wouldn't indicate the status at any other time. I would not say that such refinery capacity would have to be excluded in determining what competition there actually was in the Mid-Western area. I think you would have to give consideration to shutdown capacity as a potential factor.

The Court: Q. You would have to know the condition of the factory; you would have to know the finances of the owners; and a great many things?

A. Yes.

Q. You couldn't be positive—

A. I would say this, that most of the operating refineries have some capacity they are not using. Let me give an illustration: We built a new refinery in Toledo, or a new unit to replace the old equipment to a large extent, but then there came along a fellow 2674 with some crude that someone wanted refined, and we opened up the old refinery.

Q. The Standard Oil might be able to do that, but we had a man here a while ago, Wirt Franklin; he was in the hands of a receiver. The Standard Oil might do a lot of things a smaller refiner couldn't do.

A. I will give you another example of another small refiner. It ceased operations because of financial inability of the operator—

Q. These refineries were closed down?

A. Yes.

Q. You would have to know why they were closed down, or you couldn't give us an intelligent answer.

A. I am trying to give you an example.

Q. We would like to know if you have information as to why these were shut down, because the owner couldn't finance them, or because there was no necessity for running. All those things have to enter into it. Have you got that information?

A. Yes, I believe I have a good deal of information on that point.

Q. Well, I think you better take each refinery that has shut down and tell us what you know about that 2675 refinery and why it has shut down.

A. Well, I can give you a number of illustrations: Back in about 1932 or—

Q. Unless you have that definite and positive information, it is too speculative—

A. The point I am trying to make is that in my opinion in considering this potential competition, you have to take into consideration the shut-down capacity which is just a factor—

Q. And in arriving at that opinion, you have to take into consideration why they shut down, and how long they were shut down?

A. Yes—I know why they were shut down, your Honor, because it was my duty, as a member of the Blazer committee, to ascertain a great deal of information on that particular point.

Q. You were on that committee?

A. I was on that committee, and we collected information from a great many small refiners, some of whom had to shut down their plants, because of the extreme distress in which they found themselves and their inability to go on. I know some of them opened up again after conditions became better, and within the last year the refineries that I spoke of in Ohio that had shut down reopened.

2676 In Michigan, there are a number of small refiners that sometimes might shut down for a few months and then open up again for a few months, all depending on conditions and the price from time to time.

Q. We are dealing with conditions as of 1935 and 1936.

A. I will confine myself to the period of March, 1935, when a great many were shut down because of the conditions that existed at that time.

Those refineries were not operating in that period because they couldn't afford to operate. The price of gasoline had got to such a low point, they couldn't make ends meet, and they were forced to shut down. That—in my opinion—was the principal—and certainly in anybody's opinion, would be one of the reasons for the appointment of the Blazer committee to give study to that very situation, and we got a great many complaints, and collected a great deal of information upon the status of those independent refiners, many of whom were located right out in this area we are talking about, out in Oklahoma, Kansas, and Texas.

And they had been forced to shut down, a great many of them, on account of the lack of parity between 2677 the high price of crude relative to the low price of gasoline that then existed.

Well, then if the price of gasoline had been raised to artificial heights, no question in my mind but that a great deal of that shut down capacity would have been reopened.

Mr. Chaffetz: I thought you said many of them did reopen.

A. I did say so, because there was a great improvement in the price of gasoline relative to the price of crude after the Connally Act was passed and hot oil was gotten in hand. I feel rather strongly on this point, because we are an independent refiner, also, and I do know something about the situation of the refiners.

2678 So far I have been talking entirely about transportation by rail. It is possible to reach various points in the Indiana territory by other methods than by rail. I have had a chart prepared to show the situation with respect to water transportation into this territory.

This chart, Exhibit 938 for identification, I had prepared to show the accessibility of this territory we are discussing, these 10 states that comprise the so-called Standard of Indiana territory. I am speaking of 1935 and 1936.

(Document referred to received in evidence as EXHIBIT 938.)

The navigable waters were there in 1935 and 1936. There have been a few dams put into the Mississippi River but I think most of that program had been completed at that time. This line here represents the Mississippi River. And the Ohio River off here. The Mississippi River coming up to St. Louis and on up to Minneapolis, and the Missouri River branching off from the Mississippi at St. Louis, moving over toward the west and into Kansas City, and on up north.

Then here we have the Chicago drainage canal which empties from the Great Lakes into the Illinois River and called the Illinois Waterways. That has by 1935 already been dredged out and made navigable, you know. Where the lines have been broadened out here I have indicated those parts of these streams are navigable during the 2679 period we are talking about.

There is a perfectly easy way to get to Superior, Wisconsin, by water from New Orleans. You go up the Mississippi River up to the Great Lakes, up around here (indicating) through Sault Ste. Marie and then down to Superior.

Mr. Crawford: You can go to Europe and back three times while you are doing that.

The length of time it would take to make that trip with a load of gasoline depends on how much gasoline you are carrying along, I guess. They travel the Mississippi River at the rate of 5 or 6 miles an hour. There are a lot of locks in the canal through Chicago and I think it would be rather slow.

Now, we have the Hudson River, which is capable of taking large, ocean-going steamers up quite a ways, then when we get up around in the district of Albany, you have the New York barge canal. This is the old Erie Canal of canal days that you have all heard so much about. We are accustomed to hearing of these canals having been abandoned years ago, but there is more traffic on this canal now than there ever was in the gaudy days, the steamboat days, the gay nineties. There was petroleum traffic moving up through this route onto the Great Lakes and we have again navigation through all the Great Lakes. There was in 1935 substantial shipments of gasoline through these waters, very large traffic of petroleum products on all these waterways that I have indicated. And it is increasing very,
2680 very rapidly, because it is a very sound method of
transportation. I have a number of figures showing what has been going on there.

The United States Engineers Office of the United States War Department has charge of the navigable waters of the United States. As everyone knows, the navigable waters come under the jurisdiction of the Federal Government, and they keep very exact records of all tonnage moving up and down all these streams.

For example, in 1933 on the Mississippi and its tributaries there were 10,000,000 barrels of gasoline moved. In the Great Lakes there were 21,000,000 barrels of gasoline moved.

Now, to show the trend of those movements,—here is an article based on information from the War Department figures entitled, "Biggest Gain in Water-Borne Oil is from the Mississippi and Ohio Rivers." This is the National Petroleum News, dated June 30, 1937, beginning on page 52.

Now, that shows figures taken from the War Department. It shows, for example, in the Louisville District, in 1935, there was 3,500,000 barrels upbound on the Mississippi River. In the next year, 1936, that increased to 6,251,000 barrels. This navigation on these waters has increased at a great rate.

This is to show the accessibility by water transportation of gasoline into this area; and I am trying 2681 to show that this is not a fantastic idea; that it is something that actually goes on from day to day.

The Court: Q. During 1935 and 1936 was there actually much transportation to Minneapolis and St. Paul and south, say, for 200 or 300 miles on the Mississippi River while those dams were being constructed?

A. There was some traffic as far as Minneapolis, I believe, even then. I know I lived in Minneapolis back in 1925.

The Court: I am talking about 1935 and 1936, during the time that the Government was putting in these dams in there.

A. It was already navigable, but they improved it a great deal.

Mr. Crawford: Oh!

The Court: Q. What I want to know is, at the time the Government was building these dams in there on the Mississippi River, when all that construction work was going on, was there navigation during those years, whether they went up the Mississippi River at the time that this construction work was going on.

The Witness: Here are some figures for 1934: Oil traffic on the Mississippi River for 1934. Now, 2682 let me see. Wisconsin River to Minneapolis. I believe that would be the section we were talking about.

The Court: Yes, that would be all right.

Well, there was a little gasoline—very little gasoline. There was 1,000 barrels of lube oils. There was 41,000 barrels of coke—41,000 tons, I suppose that is. And there was some 335 barrels of asphalt.

Now, I should say that was a very small traffic at that time to Minneapolis. But it does show that there was navigation open as far as Minneapolis, I think. I think up to that time the principal shipments had been coal and coke.

Now, we have noticed that recently—I do know that some time in the last couple of years—whether it was actually in 1936, I would not say—but I do know that several of the major companies have established water terminals in Minneapolis, and I believe there is a large independent terminal there now. There was a good deal of publicity recently given to the Socony-Vacuum's beginning of a very large movement from Kansas City down the Missouri River and up the Mississippi River to Minneapolis.

I should say there was a fair amount of trans-shipment in that territory. You get large tankers coming up as far as Baton Rouge. I think they can go up as far as Memphis, but I would not say for certain. And there
2683 they can transfer their cargo to small barges that
can navigate through the locks. Now, the same thing is true from the eastern seaboard into the Great Lakes. Our company owns an interest in a boat company that does quite a good deal of hauling on the Great Lakes of petroleum products. And, for example, we go over to Buffalo and pick up cargoes of various products that have been brought up through the Erie Barge Canal. It takes a smaller boat to navigate that than to navigate the Great Lakes, naturally.

So that the typical situation is for barges to bring the material up to the region of Buffalo and then to have it transferred into large lake boats, which in turn carry it to the ultimate destination.

Now, from Buffalo around to Chicago would cost around ½¢ a gallon to bring it in an ordinary Great Lakes tanker.

And I think I am safe in saying that from New Orleans to Chicago gasoline could be hauled for somewhere in the neighborhood of 1¢ a gallon.

There are several inter-coastal canals in this country, but the one that is most important, so far as petroleum traffic is concerned, is the canal which runs inland along the Gulf Coast through all these bayous and little inlets here (indicating) and there are canals that connect
2684 these that are not—this canal is not shown on the
map. I am merely indicating where it is. It starts somewhere around Corpus Christi, Texas, which is about in here (indicating), and goes around in here in the region of Galveston, and extends all the way to New Orleans, to the Mississippi River and there is a cut-off about in here (indicating), which cuts up to the Mississippi River and makes it possible then to short-circuit this route out into the Delta of the Mississippi River. So that it is unnecessary for shipping to go out into the Gulf. Transportation on the inter-coastal canal would

be by barge. In other words, barges could pick up the gasoline at these various refineries and take it directly into the Mississippi River and on up. Those are rather modern barges, with Diesel engines, I should say. I believe those step along a little bit faster. There isn't a downstream current there to contend with, and I would say they moved perhaps 10 or 12 miles an hour.

In the early part of my testimony when I was discussing the situation in Detroit, I said that gasoline had come from Rumania. That gasoline was brought in by ocean-going tanker from Rumania as far as Montreal, up through the St. Lawrence River. We haven't shown that on here as one of the navigable streams, but everybody knows that the St. Lawrence can be navigated—can accomodate ocean-going boats as far as Montreal; and from there it can
accomodate smaller boats down through the St. Law-
2685 rence River through various locks, and they bring
it in there—did bring it in there, and on up into Detroit.

Now, that began coming in, as I recollect it, about September of that year; and after this the St. Lawrence became inaccessible for navigation and it was brought in by Steamer to Baltimore and then trans-shipped by rail into Detroit.

There is a great deal of trans-shipment of gasoline from water to rail transportation in this area. Most of the large refineries in Chicago maintain terminals at various points around the Great Lakes. For example, the Standard Oil Company of Indiana, I believe, has terminals at Green Bay, Wisconsin, at Superior, Wisconsin, at Muskegon, Michigan, at Bay City, Michigan, and at Detroit, Michigan. They haul gasoline from Chicago and then trans-ship it by rail or by truck from those terminals into the surrounding territory; and we ourselves have terminal facilities at Bay City and St. Joseph, Michigan, for our distribution.

This transportation by water is not a particularly recent development. The navigation of these rivers began to become a real factor again within the last 8 or 10 years,
I would say. It has been growing very rapidly since.
2686 I mentioned a while ago that I was a student at
the University of Minnesota when I think the first barge load of coal was brought up there by the Government barge line, and they were attempting to show that navigation was possible.

Now, the Government during the late '20's and the early '30's worked very hard to get these dams in there, and

I would say that probably during the early '30's navigation began to be a real factor.

I remember when I was studying the navigation of the Ohio River, which we use in our own territory; we take gasoline from our refineries at Latonia, Kentucky, and other points. We get gasoline from other sources along the river. and we haul the gasoline to all the points along the southern part of Ohio.

Now, then, in 1929 or 1930 we began to study that barge problem. I am trying to place these dates as nearly as I can.

And I can remember we concluded that navigation was really feasible by that time. The locks had become constructed, and it was a feasible thing to go ahead with it, and I remember we bought a new tow-boat at that time and went ahead and built up our serving of these edge points with barges.

I would say from that time on the thing has been
2687 growing very rapidly and it has become recognized now as a successful method of transportation.

Q. And would you say that was a factor in potential competition of those units outside of the Midwestern area?

A. Yes, it has become an increasingly important factor in this potential picture that we are talking about.

These dots on the map are cities of 25,000 people or over. The size of the dot doesn't indicate the size of the city. For example, we show that Chicago isn't any bigger than Wichita, Kansas, but there is a large collection of these dots around the heavily populated areas. We picked 25,000 as our unit just to show the concentration of population in cities; and that happened to be just what seemed to me a fair sized city. And I had an additional reason for showing the cities, because that is where the gasoline market is, after all—in the population centers, and I wanted to show where someone who was trying to enter this territory would want to go to market gasoline, if they were going to invade the territory. So I put these dots on to show where the markets were. And it will be noted here that most of them are along these navigable waters—along the
2688 Great Lakes and along the Mississippi River—Kansas City, Minneapolis, Chicago, Milwaukee would be right there (indicating). Detroit over here. And I think all but about 20 of these cities of 25,000 people or over are within a few miles of these navigable waters. The shaded

area is a belt that is 50 miles along each side of the navigable waters. And the reason I put that on was because people don't only ship to a given point by water. They haul it out from there by truck, radiating out from whereever they might bring the gasoline by truck. They would bring it typically into a terminal and then they trans-ship from there by trucks. I happen to be very familiar with the trucking of gasoline in large transports, and I know that 50 miles is a very conservative distance to assume for the movement of gasoline in large transport trucks. Those trucks haul about 6,000 gallons apiece. And you can truck gasoline quite a little bit cheaper in that kind of equipment than you can ship it by rail, for short distances. So that this would be an area, in my opinion, that would be influenced by the supplies coming up these navigable streams; and it is interesting to note that about 70% of all the people in these 10 states live within 50 miles of these waterways, that is, within this shaded area that is shown. I
took 50 miles because it is just an easy trucking dis-
2689 tance. Now you can truck farther than that, and I
think most companies that do truck in the kind of equipment that I mentioned do go farther than that. We do in Ohio. We go up to 100 miles, but I picked 50 to be conservative. To truck 50 miles would cost about ½¢ a gallon for 50 miles. In other words, if you went to the outside edge you would have ½¢. Most of it you wouldn't have to truck that far, so that the average would be something less than ¼¢, to truck it from the terminal on the river or lakes into the 50 mile belt. ¼¢ would do it, on the average. The cost of transporting gasoline by water is very, very much lower than the cost of transporting gasoline by rail. There are no published rates for water transportation as there are for rail transportation, of course, because most water transportation is under private operation; and the cost also varies a great deal, depending on the type of equipment and so on, but one needs to make no qualification whatever to say that it is a great deal cheaper. I would say less than half as expensive, definitely.

In determining whether or not a fixed, artificial and noncompetitive price could be maintained in the Mid-Western area by any given group, I would ask myself several
questions. First, I would ask myself, is there ca-
2690 pacity somewhere in this neighborhood of this region
that could make the gasoline to come in here in excess

of their other requirements, and in looking at that I would find, as we have found, that there is ample capacity for that purpose. In the second place, I would look to see how it could come in, whether it could come in advantageously, and under what penalties it would come in. And then, again, as we have seen, it wouldn't take but a fraction of a cent more for it to come in from these outside areas than from the very areas that normally supply the territory; and with the navigation of these rivers the possibility of your accessibility is greatly increased, so that I would say that the accessibility is there beyond question. Now, I would look further to see whether the people that might come in would care to come in. And I think that we can answer that in the affirmative because in the very nature of business, pretty nearly every company wants to expand its operations, if it can; and I know of no industry of which that is more true than the oil business, because of the fact that, with increased volume, you usually get an economy in manufacturing and in transportation and in other elements, so that there is a decided urge to try to increase your business. I think the desire, then, to come in can easily be assumed.

2691 I would look then further to see whether, if they have the capacity to get in, if they can get in, and if they want to get in, whether there is some place they could land when they got in. And if we look at that, we find that the great majority of all the marketing outlets are owned by independent marketers, who are not bound to any particular supplier except for short periods of time. I think it would have to be concluded, then, that there would be no difficulty in finding marketers available to handle your products if you wanted to bring them in, and if you were willing to take advantage of the high price that we are assuming now was being maintained. The marketers are there.

Lastly, I would ask myself, if you wanted to get in there, and you wanted to take advantage of this allegedly high price by increasing your volume through cut prices, would it be effective? Could you increase it quickly by giving price concessions here and there? And I think the figures that we showed yesterday, of the sensitiveness of gasoline consumption to changes in price, amply illustrate the ease with which a marketer that wanted to come into that area could line himself up with outlets there. Or he could build new outlets, for that matter, of course. He would have no trouble in captivating a good deal of gallonage in a short time by a few price concessions, directly or indirectly.

2692 I have had experience with refinery operation and management. Our company, as I have said, is primarily a marketing and refining company, and my own work involves considerable activity in both those departments.

These War Department figures don't show the percentage of gasoline consumed in this area that is moved into the area by water. Of course, the War Department wasn't interested in any such study; they simply reported the traffic that moved.

I am in constant, or almost constant, contact with our refining problems and our refining department. It is a part of my duties to work out operating schedules for the refineries of the company from month to month. That will include the costs of all the factors that enter into the question of where should we refine the gasoline that we need next month, and how much of each product should we make. It happens to be my duty to coordinate the refineries to the marketing requirements. And I also have contact with that through the working out of various arrangements under which we sometimes do refining for other companies, and I have usually handled the negotiating of those deals, and the following of them. I would say I had been doing that for 5 years.

I call our company an independent refiner because 2693 we don't own our crude that we refine. I believe that is the best single basis you could establish for that category.

For the period a little earlier than 1935 and 1936, I have made studies of refining costs in various areas, including Oklahoma and mid-western areas.

Q. Did you make such a study in the beginning of 1935, in January and February?

A. Well, in connection with the Blazer Code Survey Committee, we—I tried to get all the information I could then on refinery costs, in order to be able to appraise as accurately as I could the condition of those refiners at that time. That was our job, and I was more or less in charge of trying to work out those figures; that is, the refining situation of those small independent refiners during that Code period, and up to that time of our report.

Q. I wonder if you could tell us what you found in that connection?

Mr. Chaffetz: That is objected to, as immaterial and irrelevant.

The Court: Objection sustained. Exception allowed.

2694 Mr. Donovan: Your Honor will permit us to make an offer on that?

The Court: Yes, you may make an offer.

(The following proceedings were had in the absence of the jury.)

Mr. Donovan: If he had been permitted to do so, Sidney A. Swensrud would have testified that as a result of his study of the condition of independent refiners in the Mid-Continent area in the first 2 months of 1935 he found the following facts to be true as to the economic position of these refiners at that time:

1. During the year 1934 low gasoline prices and increased refinery costs caused the shutting down of many refineries, and the dismantling of some of them; that the number of refineries operating declined from 454 on January 1, 1934 to 435 on January 1, 1935; that the number of inactive plants increased from 137 as of January 1, 1934, to 196, which was the highest number shut down in the history of the country. The construction of new refineries was at a minimum in 1934, and that on January 1, 1935 only 7 new plants were being built in the entire United States. The decline in the number of refineries in operation, the considerable increase in the number of inactive plants, and the smallness of the number of new plants under construction indicates 2695 that independent refiners were losing money during the year 1934, and that many were unable to continue operations owing to their losses.

2. Under the NIRA Code refinery labor costs were increased by 25 to 30%. This increase was greatest among the independent refineries. Refiners' fuel costs in 1934 were 25 to 50% greater than in the years prior to the NIRA Code. The cost of steel products used in refineries and the costs of installing such equipment increased under the NIRA Code by from 25 to 30%. Nearly all other operating expenses also increased substantially. Under the NIRA Code there was an average increase in independent refinery operating costs of around 6¢ for every barrel of crude oil put through the refinery.

3. In January and February, 1935 virtually all independent refineries east of the Rocky Mountains which were operating on legally produced crude oil, were operating at a serious loss. The case of an independent Mid-Continent refiner who made a net refinery profit of $2,781.00 in 1932, had a refinery loss in 1933 of $6,795.00 and in the first 11 months of 1934 sustained a net refinery loss of $56,450.00, or more than 9 times his loss in 1933, was typical.

This increased loss occurred in 1934, although refinery operating expenses were relatively low and 2696 the management of the business was competent. Other refineries in this area which had been making substantial profits in 1931 and 1932 began to lose money after the Code was adopted and sustained annual losses of as much as $75,000.00 in 1934, in spite of increased operating efficiency in that year over prior years. One independent refiner in the Mid-Continent area showed a profit in 1933, and a loss in 1934, the refinery receipts amounting to approximately 21¢ a barrel less in 1934 than in 1933.

10 Western Pennsylvania refiners, who, in regard to their size, type and location, could be considered typical, as a group, sustained a net loss of 32¢ for each barrel of crude oil run, or more than $950,000.00.

These losses were all calculated without inclusion of interest on the investment.

4. Independent refinery operating costs for the 16 months from September, 1933, through the end of 1934, averaged 38½¢ higher for each barrel of crude oil refined than such costs in the 16 months preceding this period. The realization from the products of a barrel of crude oil increased only 27¢ a barrel as compared with the same 16 months prior to the N. I. R. A. Code of Fair Competition for the Oil Industry. The independent refiner was therefore worse off during the Code period by 11½¢ a barrel, compared to what he had been during the period 2697 immediately preceding the N. I. R. A. Code. The refining industry was already suffering losses prior to the N. I. R. A. Code, so that refinery losses were in general at least 11½¢ for each barrel of crude oil which was refined.

5. The original price fixing schedule under the N. I. R. A. Code, based on a crude price of $1.11

recommended a wholesale price of 6.5¢ a gallon as the minimum price which would assure a fair profit to a refiner. Adjusting this for crude oil price of $1, the minimum gasoline price to enable a refiner to meet his costs and realize no more than a fair profit would have been 6¢ a gallon. During the last 3 months of 1933 and the year 1934, however, the price averaged only 4.67¢ a gallon. In February 1935 the price averaged 4.57¢. This deficiency below the price at which the independent refiner could realize his costs and make no more than a reasonable profit, amounted to approximately .30¢ a barrel on each barrel of crude oil.

6. The Petroleum Administration under Secretary Ickes had determined at the outset of its work that the ratio between the price of crude oil and the wholesale price of gasoline should be 18.5 to 1. It established this ratio in Rule 6, Article III of the N. I. R. A. Code of Fair Competition for the Oil Industry. If this ratio of 18.5 to 1 had actually
2698 prevailed during the period from the adoption of the Code up to February, 1935, the crude price based upon the tank car prices which actually existed from October 1933 through February 1935, would have ranged from 95¢ in October 1933 down to 78¢ in October 1934 and 81¢ in February 1935. Instead of that, the price of crude oil remained at $1.00 per barrel throughout this entire period. In other words, in 1934 and the first 2 months of 1935 the independent refiner was forced to pay a price for crude oil which was out of porportion to the price of gasoline and which inevitably caused him a loss.

7. Oklahoma refineries reporting in October, 1934, had an average cost, exclusive of interest on the investment, of 5.3¢ a gallon. Including interest, the average cost was 5.6¢ a gallon. However, in that month, the average tank car price was 4.5¢ in the Oklahoma market and 4¢ in the Chicago resale market. In February, 1935, prices in the Oklahoma market were just about the same and prices in the Chicago market only about .3¢ higher. In other words, on the basis of these average costs, independent refiners were losing from .7¢ to .9¢ a gallon in October 1934 and about the same in February 1935.

2699 8. On the basis of the cost formula used by the United States Tariff Commission, the cost of gasoline on the Gulf Coast was, in 1934 and 1935 6¢ per gallon, whereas the average price which actually prevailed in February 1935 was only 5.07¢ per gallon.

9. During 1934 and the early part of 1935, there was considerable production of crude oil in excess of state allowables. This excess production, which was sold at prices below the posted price for legal crude, depressed the price at which independent refiners, who were paying the posted price for their crude oil, were able to sell their gasoline, and thereby contributed largely to their losses.

10. It was often impossible for independent refiners during 1934 and the first 2 months of 1935 to secure for their gasoline even the published tank car price, owing to the existence of retail price wars and the fact that in order to compete with the larger companies and keep their customers in business, it was necessary for them to give protection and price concessions to their distributors.

11. As a result of the lack of parity between gasoline prices and crude prices, the independent refiners were being forced in 1934 and the first 2 months of 1935 to absorb the difference between the
2700 prevailing price posted for crude oil and the lower price which would ordinarily have prevailed had crude oil prices been in line with the price of gasoline, and in effect to subsidize the marginal producers of crude oil.

12. Under ordinary circumstances where prices of gasoline and crude oil were in normal relationship, independent refiners could continue to do business and compete with the larger integrated refiners. Inefficient refiners had been virtually eliminated before the beginning of the N. I. R. A. Code.

However, under the conditions which prevailed in 1934 and the first 2 months of 1935, these independent refiners, no matter how efficient they were, were being driven out of business. Many of them had been forced to shut down their refiners and some to dismantle them completely. As a result of the factors discussed above, namely, the high price for crude oil and the low price for gasoline, resulting from illegally produced crude oil and from the necessity of frequently making price concessions to customers to enable them to continue in business, caused by local price wars, and the sharp increase in refinery

costs, independent refiners had by January and February of 1935 been put into a position where they could not long continue in business. If conditions had continued as they were in 1934 and the first 2
2701 months of 1935, a great number of such refiners would soon have been forced to shut down and the refining business would have been left almost entirely in the hands of large integrated companies. Many hundreds of independent marketers in Standard of Indiana territory depend on independent refiners for their gasoline supply.

If permitted to do so, Mr. Swensrud would have testified that he wrote the Refinery Section of the Report of the Petroleum Code Survey Committee on Small Enterprises, excepting that portion dealing with recommendations.

Mr. Swensrud would further have testified, if permitted to do so, that independent refiners complained to the Petroleum Code Survey Committee on Small Enterprises that under the N. I. R. A. Code they had suffered severe losses, largely due to (1) the fixing and maintaining of the price of crude oil at $1.00 while the price of refined products was affected by cheap, illegally produced crude oil; (2) increased operating costs as a result of the N. I. R. A. Code; (3) inability to realize even the quoted tank car prices because of the necessity of making price concessions to customers affected by local price wars in order to keep them in business and enable them to meet the competition of dealers supplied by other refiners.

2702 This testimony showing the distressed condition of independent refiners in January and February, 1935, is relevant for the following reasons, among others:

I. Counsel for the Government have sought to show that the buying that was done by these defendants was done solely for the purpose of enriching themselves. One of the defendants, on the other hand, has already testified that a chief purpose of the buying was to do something to relieve the severely distressed conditions which prevailed among independent refiners in the early winter of 1935. The defendants offer, by this testimony, to show what the situation of those refiners actually was, as proving that the explanation offered was not something which was thought of after the fact, but something which was a major problem of the oil industry, which was necessarily and in fact in the minds of these defendants, which called for immediate action to relieve the condition, and which led to the program for buying gasoline from independent refiners. The testimony in other words is offered as circumstantial evidence bearing on the question of whether or not the defendants made what purchases they did for the purpose of relieving a serious distressed condition in the independent refining section of the oil industry.

II. The defendants also offer this testimony showing the distressed condition of the independent refiner and the complaints from independent refiners 2703 to a committee set up by the Petroleum Administration as circumstantial evidence bearing on the issue of whether or not the Petroleum Administration knew of the action of these defendants in buying gasoline and believed it was a necessary and proper activity which it should permit to continue and even informally encourage, particularly because some of its activities and some of the provisions of the N. I. R. A. Code had increased the difficulties of the independent refiner.

III. The defendants further offer to show by this testimony that their purchasing from independent refiners did not cause an unreasonable restraint of interstate trade, but on the contrary furthered that commerce and preserved the business of many independent refiners who otherwise would have soon been forced to shut down. The effect of this buying was to save from extinction and to preserve as competitive factors, a great number of independent refinery enterprises, to prevent the unemployment of thousands of persons and to keep from destruction the sources of supply of many hundreds of independent marketers in the Standard of Indiana territory.

Mr. Chaffetz: Now, we would object strenuously to any further testimony, particularly going into details about the cost of particular independent refiners, 2704 without any comparable testimony as to the costs of the industry as a whole.

The Court: A pretty clear picture in my mind, in view of the record, is that the refiners were really in difficulties down there. They were in distressed condition. No question about it at all.

Mr. Lewin: We know that Mr. Fahy, and Dr. Frey, and these other men on the Board had no power to authorize this kind of thing, to relieve them.

The Court: I thought they had a duty to advise Mr. Ickes that something was happening. They had that duty.

We won't have any more discussion on it. I think there is ample testimony in here as to the condition of the refiners, and I don't think the testimony of this witness would be competent. Objection to this testimony is sustained. Exception allowed.

(The following proceedings were had in the presence of the jury.)

Mr. Donovan: Your Honor, this is an extract from the Crude Petroleum and Petroleum Products which you asked for, the Minerals Yearbook, published by the Department of the Interior—I think that is the Bureau of Mines, isn't it, Mr. Swensrud?

2705 A. The Bureau of Mines is now in the Department of the Interior, yes.

Mr. Donovan: Yes, for 1934, which is the last figure available by states. The production in 1934 in Pennsylvania was 38,900,000 barrels of gasoline.

By Mr. Donovan

Most of the crude oil refined in Pennsylvania comes from outside the state of Pennsylvania. To illustrate that point, most of the refineries in Pennsylvania, on the Seaboard, of course, operate on crude brought around by tankers. That is, like Sun Oil Company. And in Western Pennsylvania—the Gulf, for example, has a refinery at Pittsburgh, or in that neighborhood, Neville Island.

Now, the crude for that refinery is brought in from Oklahoma and Texas through the Gulf's own pipe lines—or, it is brought most of the way through their own pipe line, and then by connecting lines. There are quite a number of refineries around Philadelphia.

In talking about an independent refiner, I classified our company as an independent refiner because we did not produce our own crude. We are generally thought of as a major company, but we are an independent refiner. In other words, in our refinery, we buy all the crude that we refine. I suppose most of the refiners produce some of their own crude, but I think on the whole they would buy most of it. There would be a great variation in 2706 individual cases. The words, "independent" and "major" are very loose words; we have to recognize that. We are not fully integrated, and I would call us an independent refiner in the usual sense that that term has any meaning.

Cross-Examination by Mr. Chaffetz.

Our company is very large, compared with the average small independent refiner. We are generally thought of as the price leader in the state of Ohio. We don't always lead though. I think the reason we are known as the price leader in Ohio is historic; there are two explanations. One is historic, and the other is that we have the largest volume of business in Ohio. We are the largest distributor of gasoline in Ohio. Our annual sales of gasoline are about 250,000,000 gallons.

I imagine the Black Gold Refining Company is an independent refiner. Their total sales in 1936 were 10,000,000 gallons. As far as I know, Omar Refining Company would be called an independent. Exhibit 927 shows sales in 1935 of 23,000,000 gallons; in 1936, 31,000,000 gallons. The Eason Oil Company is an independent, I believe, located at Enid, Oklahoma. Exhibit 929 shows total sales, 1935, 24,000,000; 1936, 26,000,000.

2707 Mr. Chaffetz: There was evidence yesterday, in the form of Exhibit 928, with respect to the Kanotex Refining Company; and its total sales in 1935 were 53,000,000 gallons; in 1936, 50,000,000 gallons.

A. Our sales in either of those years were roughly 250,000,000 gallons.

Carter Oil Company, a crude producing company, is a subsidiary of Standard Oil Company of New Jersey. We purchase a good deal of our crude from Carter Oil Company. We have done that since 1931, I believe.

Standard of Ohio does business almost exclusively in Ohio, but Fleetwing Corporation does business in the Standard of Indiana territory, in the states of Michigan and Indiana. I think the Fleetwing Company sells 15,000,000 or 20,000,000 gallons a year of gasoline in Michigan, and substantially lesser quantities than that in Indiana. In Michigan and Indiana we sell entirely to jobbers, under the name Fleetwing. We have a contract which we use, or Fleetwing does, in making sales to jobbers. We do not sell to jobbers in those areas on the spot market. All the jobbers to which we sell are jobbers with whom we have contracts. We tried to sell gasoline

in Detroit in December, 1935, I believe. But I would
2708 not say for certain that that was the first time our company did business there.

Q. And that is when you started to do business in any substantial amount in the Indiana territory?

A. Well, that was the largest single piece of business we did, I think, that comes to my mind.

At that time we negotiated a contract with a jobber—The Red Indian Oil Company, Mr. I. A. Dworman's Company. I would not want to say exactly when we first began to do business in the State of Indiana. I would say sometime in 1935 or 1936. You see the Fleetwing Company is a company we bought out some time in the thirties, and it has been expanding its operations. I mentioned that it has been expanding in New York and Pennsylvania and Kentucky, and we have in the last few years begun to sell some gasoline in Michigan and Indiana.

We were not persuaded to enter this territory, Michigan and Indiana, because the prevailing price of gasoline there was right. We did not think it was a good price there. We were, I would say, almost dissuaded because it was so low. What persuaded us to go in there was the fact that in the long run we wanted to have a little wider distribution of gasoline, and therefore we were willing to sustain a rather low realization for the moment.

I cannot tell you how many jobbers we have in the
2709 State of Michigan. I don't know how many we had during 1936. I could say perhaps a dozen, and I would not be far off, I should imagine. We had maybe 5 to 10 in the State of Indiana.

We have a regular form of jobber contract that we use in most cases. There is no absolute guaranty provision in these contracts. The provision in most of our contracts is that the price shall be 2¢ under the undivided dealer price. We call the "undivided dealer" the one who handles our products exclusively; but that is just a trade term. Now, if that does not net back a certain minimum amount, then we have the privilege of charging that higher amount or cancelling out. And in some cases there is a so-called "split" provision. There are quite a number of different types of contracts that we have. That we have had from time to time.

I should certainly think that the contract we made in Michigan and Indiana at the time we made it was similar to the contract used in the same areas by the defendant companies in this case, because you cannot get busi-

ness without knowing about what your competitors are doing. If we offered a better contract, it would be easier to get more business, unless our competitors met it, and I think we would consider the fact that if we gave a better contract, others would meet it, and all would
2710 be down on a low level. If we are going into a new territory with a lot of companies doing business there, and a fairly uniform type of jobber contract prevailing there, we have to consider what kind of contract we are going to offer and what price we are going to charge.

Q. And you say to yourself "if I charge a lower price than the others are charging their jobber they will meet me and we will all get a lower price, and therefore I had better not give the jobber a better contract". Isn't that right?

A. Why, I don't think that follows at all. There are many ways of giving reduced prices besides merely cutting the price.

We made the jobber contract, but we do not always charge the jobber what that contract provides. In fact, I would say in our case that is very rarely the situation. This is not because of the local price wars prevailing in the city of Detroit, but because for various reasons we may not want to charge the jobber as high a price as our contract would permit us to charge. When you enter into a contract with a jobber, that means that you are going to do business with him for a period of time. Now, he is a man, or a company, that usually has quite a large investment in this business. It cannot be changing suppliers every day. There are a lot of things it must do to accommodate itself to this new source of supply.
2711 It must persuade all its dealers to take on a new brand of gasoline. Let's say the Fleetwing has been selling certain of the other leading brands. Well, this jobber has got to convince these dealers that they should change.

Now, on the supplier's side, he makes quite an investment. He may have to make new transportation facilities. He will certainly have to do something in the way of supplying advertising material and signs and globes for the pumps, and a great many different things that all add up to a nice round sum that the supplier must spend in order to take on a jobber.

You cannot do that without having some attraction of continuity, so a contract would be entered into with each one to continue the relationship in order to justify the expenditure. You cannot make a contract without putting a price provision in. And I do not believe that any one can foresee a year ahead what the price situation may be, and what price it may be in fact necessary to charge the jobber as a practical matter of marketing policy from time to time during that contract period.

Now, in our own case I made a check before I came up here to see in how many cases we were charging the jobber the price the contract permitted us to charge, and 2712 I checked it on about three different dates just selected at random, and on none of those dates were we charging any substantial portion of those jobbers what those contracts permitted us to charge.

Q. Now, let's assume the prevailing price of gasoline in Madison is high and arbitrary under your definition of it. A jobber is doing business there. Now, suppose the Fleetwing Company came to a jobber in Madison and said "We can give you a better deal. The price is high here and we can undersell it, and sell to you for ¼¢ less than you are paying now." That jobber would have to consider whether he would do business with you nevertherless, wouldn't he?

A. Yes. I should think he would consider the trade acceptance of our product in his territory, and the amount of advertising he would have to do in order to change his customer's attitude. Assuming that we are offering a contract for the year at ¼¢ less than the jobber is paying at the time, and assuming that the price is high and arbitrary and that we can undersell by ¼¢, I agree that the jobber would stop to consider before he would do business with us. He would consider what the trade acceptance of our brand is in his territory.

2713 I don't know that he would probably consider that nobody ever heard of Fleetwing in Madison. They have certainly heard of it by now; but I think that would be a fair assumption.

I don't believe this man would have a chance of losing any part of his business, if he gave up his present brand to do business with us. The business he has doesn't depend on the brand he sells. It depends on him. He is an independent merchant, and he gets his business through personal efforts, and not because he sells this brand or that brand. I think one brand against another is of less importance to a jobber than other factors under his control. I said I did not think, assuming that he changed brands, that he would lose business, and I don't think so. I think that would be normal for a jobber—largely to advertise the brand he was selling. If he had been doing business with Phillips over a period of years, he would be persuading his customers to buy with him primarily, and I suppose he would be telling them that Phillips was a good grade of gasoline. I think customers buy with him primarily, and buy Phillips gasoline secondarily. I am convinced of this because of a great many studies made on what the customers buy.

I would say that the usual tourists typically go to a
2714 station that sells a brand that they have reason to believe is all right—not necessarily one that they have been using before. I think my own feeling, and I think I am right, is that he wouldn't look so much for the brand he has been buying before, because usually the tourist is interested very much in the service and location on his route and the type of station. Now, clean restrooms, and that sort of thing are much more influential to the tourist.

I would not say that most of the big concerns maintain the same kind of restrooms. Since the Iowa Plan has been adopted, very few operate stations themselves. A filling station that maintains a filthy restroom will do little business. I cannot agree that most of them maintain clean, sanitary restrooms. The average customer will be more influenced by clean restrooms than by the brand of gasoline sold at a station.

The advantage to the jobber in having a major company brand to sell is that he has a recognized brand which doesn't, at least, constitute a resistance to the customer that he is selling. It would depend where the tourist was coming from. If from down in Oklahoma, he would have heard of Phillips more than Fleetwing. If coming from Ohio, he probably would never have heard of Phillips, but he would have heard of Fleetwing. As for a man living in La Crosse, Wisconsin, I would say if he was coming
2715 into Madison and needed gasoline, he would do the very thing I have been talking about, he would look for a clean station, a brand that would be all right, and where he would get good service.

Although he had been buying Phillips at home, I think when he came to Madison he would buy Fleetwing just as readily as Phillips, if it was sold at a good station; that is, if there was any difference in the stations. If there were no difference, the balance would be thrown in favor of

Phillips. I cannot say how often an automobile owner changes his brand of gasoline. I would say the majority of people have a slight preference for some station or some brand, more often for a particular station. Most people have one station in the neighborhood of their home where they buy most of their gasoline. They would change their brand as often as this station changed. I have already told you that regular grade is substantially the same at all stations among the brands of gasoline.

Assuming I was a jobber in this vicinity, and had to decide what brand of gasoline I was going to handle, or whether I would handle an unbranded gasoline, I would have to qualify my answer by saying that if everything else was equal I probably would have a preference for a brand that was well-known in the community, and that
2716 would depend on other things. I don't have any doubt that I would prefer to have a brand that was well-known in this community and well-regarded.

If I had been handling a particular brand for a period of time, my resistance towards changing to any other brand would depend on the kind of relations I had had with that supplier, and whether the gasoline itself had been suitable to my customers and how I liked the relationship with that supplier in general, both as to the product I was selling, not only gasoline but other products, oil, and so on.

Assuming my relations with the supplier had been satisfactory and friendly, and assuming the gasoline was about as satisfactory as all other brands to my customers, under those conditions, I would not necessarily be resistant to changes, but I wouldn't want to look for changes.

I think that a jobber likes to stay with the same brand if it gives him all he could get from any other brand and if his relations with the supplier have been satisfactory.

Whether he would expect to get more from that brand which has been known in his community than from a brand that was unknown in his community would depend on how much the new supplier would do in the way of adver-
2717 tising in regard to the previous supplier. Where the supplier had not done a good advertising job the new supplier comes in and convinces him that in a very short time he can overcome any real resistance to speak of and put in the new brand in a better state than the old one.

In the case of jobbers who are handling Phillips or Shell or Pure Oil and others, and the Fleetwing comes around and wants to do business with the jobbers, we would not necessarily—or even probably—have to offer something in the way of concessions to those jobbers, ordinarily to get them to give up their present brands in order to go into this territory. I will tell you the particular appeal that we think Fleetwing has for jobbers, and that is that it is essentially the jobbers' own brand. And he is, above all, an independent merchant, and he wants the brand that is not in competition with the brand that is being sold by the major company itself through its own bulk stations. That is the basis which we with the Fleetwing brand try to interest the jobbers to handle that brand, and a great many of them are very much influenced by that. They say, "Here is a brand that the parent company that owns the brand won't be coming in and putting in bulk stations and going into competition with me on that same brand."

2718 We do some sectional radio advertising with Fleetwing, in the section where it is distributed. We advertise Fleetwing gasoline throughout the territory where we market—We do not advertise over the radio nationally, only one or two or three companies do that.

The Texas Company program and the Skelly program is not a national hook-up. There are 2 or 3 or 4 that probably have a national hook-up. I think it in general increases their sales.

Taking the Root Refining Company, which I think is located down here somewhere near Shreveport, I think I pointed to the refineries in the area where Root is, as companies which could come here and sell gasoline if the price was high and artificial. I included Root in the refineries I referred to.

So far as I know, Root has no advertised brand known in this area around Madison. If Root should say to a jobber here, "The price here is high and arbitrary. We will sell to you for ¼¢ less than you are paying. Our freight rate is only a fraction of a cent greater than the freight rate from Oklahoma," I don't think the jobber would be reluctant to make the change. Let us assume that he sells 1,000,000 gallons a year. That would be $2,500 a year.

I would say that would be quite influential in an average independent marketer's financial thinking. I
2719 think that quite a number of the branded jobbers up here would give up their brands in order to purchase independent gasoline at ¼¢ less than they are paying. As I say, there is a continual shift of accounts from one brand to another, thinking over a period; otherwise, the Socony-Vacuum and the Gulf wouldn't be marketing in these new territories that they are marketing in. They generally get into these new territories by taking on existing jobbers.

That $2,500 would be quite an influential inducement to the man handling Pure Oil, widely advertised in this State, or handling Gulf, which is also widely advertised in this State, or Sinclair, or most of these other companies, to give up that product.

If he took off his Pure signs and put up Root gasoline, we will have to assume that the Root Company would try to do something to put its brand before the public, would do some advertising and—

Not making any other assumptions for the moment, except that Root gave him ¼¢ below, he wouldn't be making a price concession if he did that. He is giving him ¼¢ less, but there are many elements that enter into the question of cost or of price. In other words, suppose that the Root Company, or the Pure Oil Company sells him his oil at 10¢ a gallon, and Root won't match that. Now,
2720 you are making one assumption that involves one of
the many elements that enter into the ultimate costs of that jobber.

Assuming that the Root Company did everything that the Phillips Company did, and in addition thereto, sold the same kind of gasoline, delivered here, for ¼¢ less, I would say that would be quite influential, and the jobber would think a long time before he would say not to accept that offer. He would think a long time before he would decide not to give up the Phillips Company and take over Root.

I don't think it is true that the average jobber business is built up on the basis of his handling a particular brand.

I was not in court when the jobbers were testifying, earlier in the case. I wouldn't say that many of the jobbers would take on major company brands because of the trade acceptance of those brands in their area; some of them would. That would depend, again, on whether they thought there were any disadvantages in doing that, that would overcome the advantage of it. The jobbers have more and more taken on national brands or sectional brands because I would say there is some advantage in a brand that is well known; whereas, the average jobber's own par-
2721 ticular brand, that he sells nowhere except in that
particular town, is a disadvantage, because it does create some resistance.

Now, then, it doesn't take a very terrifically widely known brand, it doesn't have to be one that is known all the way from Maine to California, to give him the type of advantage that he wants to get out of his brand, namely, a general recognition that this is not just his particular brand, that doesn't mean a thing except it is John Jones' gasoline. He wants a brand that, in the public's mind will mean that he has got a known product; that is, something just a little bit more than that particular town. Now, there are many brands that will fulfill those requirements. And the additional fact that the companies that maintain those brands usually do a lot of advertising at their expense, and not at his; whereas, if he has a private brand, he has to do his own advertising.

If Root, seeing a high and arbitrary price prevailing up here in Madison, and thinking that it can undersell that price, wants to come in to do business in this territory, it has to consider the cost of overcoming the advantage that the companies have who are already here. It would have to do something to create acceptance for its brand. Everybody does. You have to build up an acceptance for
2722 your product in that territory. And you have to maintain that by continued expenditures along those lines.

As for the length of time it would take for this jobber to convince his dealers that they ought to switch over from Pure Oil to Root, and establish that business, I would say that if the jobber had his business established, I don't believe he would need to worry about a very large diminution in his gallonage as a result of the change in brand, if he prepared his dealers and his customers for it by a little advance publicity, and so on.

The jobber would have to do some advertising, too. He would want to do some word of mouth advertising, certainly. His dealers would be told of the switch that was to come about; and if they agreed about it, they would go along; and they would begin to tell their customers, and they would probably get a story about Root's gasoline being much better than Phillips, or whoever it was that it was displacing. And they would picture it as a big step in progress that they were making this shift, and they were adopting the Root gasoline which had all those fine qualities. It is just natural for people to try to play up the qualities they are selling, or getting ready to sell.

Q. Don't you think that these major companies
2723 feel that they have expended large sums of money, tremendous sums of money, if you please, and tremendous amounts of energy, in getting their products accepted in the trade with which they do business?

A. Why, certainly.

Q. And they feel that it has taken them a long time to do it; isn't that true?

Mr. Donovon: Now, if it please the Court, what the major companies feel, I object to.

The Court: Oh, I think it is a matter of common knowledge that they are endeavoring to do all of the business that they can—

Mr. Donovan: Yes, but that isn't the question—

The Court: (Continuing.) —and they are advertising, and it is a perfectly legitimate thing to do.

Mr. Donovan: I know, your Honor, but that isn't the question. The question is, what the witness thinks they feel—

Mr. Lewin: Your Honor, this witness went into the most opinion stuff you ever heard, on direct—

The Court: I know he did.

Mr. Donovan: I object to that statement by Mr. Lewin.

2724 The Court: He is an expert witness, and—

Mr. Donovan: If your Honor please, I object to that statement by Mr. Lewin in the presence of the jury.

The Court: Why he did go into a lot of expert opinions.

Mr. Donovan: I am objecting to his manner of making the statement, also.

The Court: Oh, well, I can't control his manner.

Mr. Donovan: Well, that is something that is obvious to the Court and to the jury.

The Court: Mr. Lewin did say that this witness testified and gave his opinion as to a great many things; and he has. And I think the method of cross-examining an expert, which has been adopted by Mr. Chaffetz, is proper. Exception allowed.

Mr. Donovan: I would like to put in some tabulations. I will do it now because I think counsel may want to use them in cross-examination.

I would like to have marked for identification tabulation giving refining capacity of present defendant companies and subsidiaries in refining areas alleged by the indictment to supply the Mid-Western area as of January 1, 1935, according to the 2725 United States Bureau of Mines Information Circular No. 6850.

(Document referred to marked Exhibit 939 for identification.)

By Mr. Donovan

Exhibit 939 is a tabulation that I prepared relative to the refinery capacity of present refineries presented in the tabulation. That was based upon the information in the circular of the Department of the Interior.

(Document previously so marked for identification is received in evidence as EXHIBIT 939.)

Mr. Donovan: I offer in evidence refinery capacity controlled by defendants in the area surrounding the Standard of Indiana territory January 1, according to United States Bureau of Mines Information Circular 6850.

(Document referred to marked Exhibit 940 for identification.)

Mr. Donovan: Refining capacity of present defendant companies and subsidiaries in refining areas alleged by the indictment to supply the Mid-Western area, as of January 1, 1936, according to the United States Bureau of Mines Information Circular No. 6906. I offer that in evidence. 2726

(Document referred to marked Exhibit 941 for identification.)

Mr. Donovan: Also daily refinery capacity of defendant company subsidiaries and dismissed defendants in area surrounding the Standard of Indiana territory as of January 1, 1936, according to the United States Bureau of Mines Information Circular No. 6906.

(Document referred to marked Exhibit 942 for identification.)

Mr. Donovan: I would like to have marked for identification Information Circular, the Department of the Interior United States Bureau of Mines, the Petroleum Refineries including Cracking Plants in the United States January 1, 1935.

(Document referred to marked Exhibit 943 for identification.)

Mr. Donovan: Also Information Circular Department of the Interior, United States Bureau of Mines, Petroleum Refineries including Cracking Plants in the United States, January 1, 1936.

(Document referred to marked Exhibit 944 for identification.)

(Documents previously so marked for identification are received in evidence as EXHIBITS 939, 940, 941, and 942.)

2727 *By Mr. Chaffetz*

As for the Rumanian gasoline which I said in my direct testimony came in the Indiana territory, I cannot tell you the number of gallons that were imported. There was quite a quantity of it, I believe. Its distribution in the Indiana territory, I believe, was confined to a rather local area in Michigan. I would not be certain as to how many companies might have distributed it, but I believe most of it was sold by one company. The particular shipment that I was referring to I think was all sold by one company, and that was the Sunny Service Company. I believe a man named Austin ran that company. I don't know where he is located now. He and his company were in Detroit. I believe he sold out part of his interest. I am not sure though.

I don't think there was a mystery surrounding that particular Rumanian gasoline. There was a lot of publicity concerning it. That was one of the things that led to the imposition of a tariff. I do not recall when that was done, 1932 or 1933.

The Rumanian oil was not a competitive factor in 1935 and 1936. I mentioned it as to the fact of the cut price at that time that led to a cut price in Detroit. There is not much of that oil coming down the St. Lawrence River now. That was an unusual situation where
2728 there was some cheap gasoline.

I would say it is important to a jobber to have assurance of a continued supply from his supplier. Of course, it is important to any business to have a continuous supply. I do not think he needs to be assured he would always get it from one supplier. I know he needs to have assurance that he can get more gasoline if he wants it.

If he had been advertising a particular brand and was unable to get enough of it, I don't think that would stop him from getting gasoline in general. A substantial number of jobbers, but a small part of the total, sell from more than one source of supply. Most jobbers are exclusive patrons for particular advertised brands during the time they continue to sell the goods of one company. This supposed jobber in Madison, trying to decide whether to take on the Root product, I think would want to have assurance that he would have a continuous supply of gasoline from Root if he established that name in the territory. If Root should offer a lower price because of the high, arbitrary and artificial price in Madison, I don't think the jobber would necessarily concern himself as to whether

Root would always want to be shipping gasoline to that territory, so long as he had assurance that he could get it by a reasonable time.

You must remember this jobber business is not in 2729 people driving into a service station and demanding a particular brand. Very little of it is of that type. As I testified yesterday, about 40% of the gasoline sold is to people who run trucks, and where delivery is made in tank trucks to some customers, and most of those customers, or a large number of them, do not give a rap about what brand it is. It is a matter of getting the grade of gasoline they want, primarily, and a matter of price. If he had ¼¢ advantage which you are asking me to assume, I would say he could increase his business very definitely through getting more of that kind of business. He could corner a good deal of business in Madison.

The Fiore Coal & Coke Company, which has been handling Phillips 66 for a number of years in Madison, could increase it business if it took on an independent brand, not known here, at ¼¢ less and passed on that ¼¢ to the consuming public.

You see an extra ¼¢ for advertising would go a long ways to take care of the jobber in this matter. ¼¢ is about all that is spent. For example, Fleetwing, we spent about ⅛¢ a gallon on advertising Fleetwing name, and the jobber spends about another ⅛¢. If any jobber wanted to spend ¼¢ a gallon in addition to what he would ordinarily have spent, he could greatly increase his business.

2730 My own opinion is that he would use that ¼¢ not entirely in advertising. He would use it also in other ways. If he wanted to offer the leading taxicab companies in town ¼¢ less price on this new gasoline, he would get a very large percentage of that business as compared with the business he could get with Phillips at ¼¢ higher, in my opinion, and that would more than make up for any loss in sales to people who were insistent upon getting Phillips gasoline.

Q. Now, I would like to go back to my question. Here is a jobber in Madison who is thinking of changing over from Phillips 66 to Root.

And Root is trying to sell him some gasoline. I ask you whether this jobber would not want to make certain as far as he could that if he took on the Root name and spent money advertising it, that

Root would be a continual source of supply for him over a period of time?

A. I think he would want to know what Root's ultimate purpose was, whether he was trying to expand into a new territory, or get some short run sales. From Root's standpoint, if they did not care to have it—

The Court: All the question asked was, he would want some assurance that Root would deliver over a length of time so he could make some plans. Can you answer that?

2731 A. I would say 6 months to a year would be plenty for that.

Mr. Chaffetz: Q. You think if he thought Root could supply him over 6 months he would turn to Root, figuring that at the end of 6 months he would again have to advertise some new brand if Root stopped sending gasoline?

A. I think it would depend in part upon the nature of his own business. Now, if he had nothing but his own service stations that he had been distributing this brand of gasoline in for many years—

Q. No, that is not usual, a jobber having nothing but his own stations, is it?

A. Well, the usual jobber is rather a hard thing to describe—

Q. Yes, the usual one is not one who has all his own stations?

A. No, and that is why I am saying that you might have a jobber who had no stations of his own, and only a few dealers, where most of his business was the type of commercial accounts I am describing—

Q. Now, do we have to have so much difficulty over that simple question? Is it a fact that any jobber, whether he has his own service stations, or has half his own stations, and half stations of independent dealers, or none of his own stations, isn't it 2732 true, before he undertakes to establish a new brand in his community, a brand that is unknown there, doesn't he want to be able to be assured that he will be able to get that brand of gasoline for a long period of time, and for a longer period of time than 6 months?

A. Well—

The Court: You can answer that yes or no.

A. I can only answer it in terms of jobbers—

The Court: Well, assuming the things he told you to assume, now, answer it.

A. Well, if he will tell me what he assumes as to how the jobber's business is divided among his own service stations, his dealers and his commercial business, I think I can probably help him.

Mr. Chaffetz: Q. The bulk of the jobber's business is to retail stations, isn't it, most of it?

A. I think more than half, in most cases.

Q. And certainly most of it is to retail stations and to consumers who buy branded product, who buy on the basis of a brand?

A. No, sir. The latter part of the business, I would say, is primarily not bought on the basis of brand.

Q. Not at all?

2733 A. I said that a commercial user—let's take the taxicab companies in Madison.

I don't believe that they would let the difference between one brand and another stand in the way of saving ¼¢ a gallon, unless they had positive knowledge that that brand on which they would save it wouldn't work in those taxicabs.

Q. And even they wouldn't take on Root just as quickly as they would take on Phillips 66, would they? You would have to persuade them that it was a good grade of gasoline first, wouldn't you?

A. Well, I don't think that follows. They might have tests made, they would get information about the gasoline, which would give them some idea of the mileage they would get.

The Court: Now, let's get back to the original question you were asked. Will you read that question?

I said I thought that 6 months or a year would be long enough, unless he was a jobber who had only or almost only retail stations, where brand was of somewhat more importance than in the commercial. I said that if he had a large commercial business, or thought that as a result of a lower cost gasoline he could develop a large commercial business, then he might not care very much how long he had the supply, because then he might be changing the sources—

2734 As I said, about 60% of the gasoline is sold to automobile drivers. The jobber would consider that, but there again I think the question of patronage depends more upon him than upon the brand he sells.

Now, for example, you asked me about the jobber that we took on in Detroit. Fleetwing hadn't been sold in Detroit before. That jobber did not lose business in the first year that he took on that new brand. And, speaking of Detroit, you have raised this name of Sunny Service. You must be familiar with the rapidity with which, in that case, a new brand, never heard of in Detroit, became a leading, had more volume in a year or two in Detroit than any other brand sold there.

I don't believe they did any excessive amount of advertising. They did undersell. I am not familiar with any large amount of advertising that Sunny Service did.

I don't know whether I ever saw any Detroit papers during the period when Sunny Service was organized. I think their trade name was "Zip." That name became pretty widely known in a short period. It does not take very long to establish a new brand in a community, especially if you can cut the price. They did it in a year or so. They cut the price 2¢ a gallon, increased their volume, and made a lot of money. I don't know what became of the Sunny Service, whether they sold out or not.

2735 Looking at the matter from the standpoint of the Root Company, I assume that it sees in Madison that the price is high, arbitrary and artificial, and that it can sell gasoline there cheaper and make a good profit notwithstanding the freight rate. I think one of the things that Root would consider would be whether it desired to establish a sales organization and create a distribution area for itself in that territory over a period of time. They might just look at the price and say, "We will go up there tomorrow and sell our gasoline."

That would depend on the nature of that refiner's business. In the particular case you mention, I think they might, because Root Refining Company, from what I know of it, makes a high octane gasoline that is rather a good brand to sell to jobbers or distributors having their own brand. It is a fairly high octane, unleaded gasoline, at least the kind of gasoline that I am familiar with that company selling—down there in Shreveport, the crude oil down there has to be the kind from which you can make a pretty high octane gasoline without its being leaded, and that makes an easy gasoline to sell to a low price marketer, who might have his own brand, or no brand at all. So that it would be an ideal kind of an example of a company, a refining company simply wanting to go in and take advantage of a high price while it lasted, and depart when the going wasn't so good, if you please.

2736 It would be an ideal example of what I have been talking about, of the kind of gasoline that would move under the hands of cut price marketers and break down this high, artificial price you are asking me to suppose.

The number of jobbers who handle unbranded products, who sell gasoline under their own brand names, are small in quantity compared with those who handle a branded product in the Indiana territory, but their volume might be very large. They are small in number, but large in importance. A number of them are established in cut rate stations. It is partly true that they substitute cut price for brand as a means of selling. Now, if Root were trying to establish the Root brand as a big brand in this territory, it might be true that it would have to consider over how long a period of time it could undersell competition in this territory before seeking to establish a market here. If it is merely trying to sell some gasoline, to take advantage of a high and artificial price, then I would say that it might be interested in selling one tank car to some cut price marketer here. If Root wanted to get jobbers away from others who were selling under contracts the branded products of, let us say, Phillips, it would have to be able to show the jobber that it really meant to try to establish itself over a period of time in this territory on a competitive basis.

2737 It would have to be able to show the jobber that it really meant to try to do that, I suppose, most jobbers, at least. But, as you say, it might not decide that that was the way it ought to enter into the market. It might decide that the better way was not to try to get an established jobber, selling one of the main brands. It might try to get a marketer who wouldn't rely upon a brand as much as upon cut price.

I have told you that that type of marketer is a small part of a number of marketers in this territory, but I have also said that he can become a very large element in the market if he has a cut price. Some of them sell as low as 2¢ below the other prices. They haven't taken away all the business of the other companies, but they have taken away a good deal. If I were employed by the Root Company and sent up here to establish a market for them, I would take into consideration the major company brands that were being sold here. If I was interested in a period of 2 or 3 years, I would take into consideration what kind of competition they could give and could maintain over that period. If I was merely trying to take advantage of an artificially high price maintained here, I don't know that I would be interested in any particular length of time. I would be interested in making some money on an immediate sale, and perhaps not making any commitment that required me to give any consideration to how long I could continue that.

2738 It might not cost more than my traveling expenses up here to establish a business and do our advertising, say for a month or so. There might be a post office business in this town that might be up for public bidding, and I might simply come in and underbid and ship in tank cars. If I were trying to establish the Root brand here to do business for a long time, I would give consideration to whether the price over a long period of time up here would be attractive. I would look into the factors that made the price; would want to know what kind of a price it was.

I would try to size up the territory—and, assuming now that I want to get established in Wisconsin—that I am not just trying to take advantage of a temporary high price, then I must have motives for believing that in the long run I can economically distribute in this state. That is the only basis on which I can assume that I would want to come up here and do this analyzing.

If I found the price prevailing today was high, artificial and arbitrary, I still might not care to come up here to compete and establish a business if I thought that that price might not last.

If I am the Root salesman coming up here, if my
2739 object is to spread the Root brand, then maybe I want to give consideration to the transportation factors, and how much it will cost me to put a terminal up here, and what the long run situation is in the industry, and a great many things. If that is my objective, I am willing to spend some money to get it established.

Q. Now, that isn't at all what I asked you, and it isn't responsive to my question at all, I submit to you. I said to you this: That if you found today that the price prevailing here was high, arbitrary and artificial, a price that you could beat despite an adverse freight differential, you might still hesitate to try to establish a business here if you didn't believe that that price was going to continue over a period of time, if you weren't sure it was going to continue over a period of time?

A. I don't think I would necessarily be concerned with the long time factors. I don't think Root is, as a matter of fact. I have in my file here some records of its sales in Ohio. It sells in Ohio one month;

the next month it doesn't sell, and the next month it sells again.

Mr. Chaffetz: Oh, that isn't my question.

Q. Let's take any company in that field, any company in the Louisiana-Arkansas area. It finds 2740 that the price in Wisconsin is high, artificial and arbitrary, a price that it can beat despite an adverse freight differential. If it could compete on the basis of that price, it would be worth that company's while to come in and establish a business here, because it could undersell that price. Now, I suggest to you that, if they found that that price was being artificially maintained there, so that it might not be the same high, artificial price tomorrow, they would hesitate before going in to compete on the basis of that high and artificial price.

A. With a long term investment in a brand, yes —but not necessarily.

Q. That was my question, though. I said, come in and establish a business here.

A. Well, establish a business—one tank car establishes a business.

Q. Does one tank car establish a business?

A. It is business, yes, but—

Q. Let's have no misunderstanding. I am talking about their making contracts with jobbers in the same way that Pure and Shell and Skelly and Barnsdall and the others do.

A. I think if Root was anxious to try to estab- 2741 lish a business in this state it would find no better opportunity than during the period you have mentioned because under those circumstances we can assume that it has been trying for years to try to—

Q. I must cut you off because that was not my question. I am not assuming that Root wanted to establish a business here at all.

A. I thought you wanted me to assume that.

Q. I am assuming that there is a high price here which Root can beat, and the question is, because the price is high could they come in here and establish a business?

A. Well, that would be—

Q. Can't you see the difference between those two situations?

A. I say that in the case of Root I don't think they would come in and—

Q. Take any company in the Louisiana-Arkansas area, the "X" company.

A. Well, there would be—

Q. You are an economist, aren't you? Isn't tha what you qualified as?

A. I believe so.

Q. Now, let's take another illustration. Let' put the oil producer out of it. Let's take iodine

2742 Do you know anything about iodine?

A. Not very much, nothing but seaweed.

Q. Do you know that iodine comes in here fron Chile in large quantities?

A. No, I don't.

Q. Let's take a hypothetical situation—We wil assume that iodine does come in here from Chile It can be produced in Chile for 25¢ a unit. It i sold in the United States—let's eliminate tariffs— it is sold in the United States for $2.00 a unit Iodine can be produced in the United States, w will say, for $1.00 a unit, and can be sold at profit of $1.00 a unit. Somebody comes to you and asks your advice, as a business manager, as t whether he should establish a business in the Unite States in the manufacture and sale of iodine. He says the current price is $2.00, we can sell it at good profit, at $1.00. Would you advise that man to go into the iodine business?

A. Why, I think I would, if he could make $1.0 profit on it for the time being—

Q. Don't you know that the very day he starts to sell his brand for $1.00, the Chile man would sell it for 75¢, because it only costs him 25¢ to produce it?

A. I don't know that.

2743 Q. I told you that in my assumption. I told you it cost 25¢ to produce it in Chile. They sell it in the United States for $2.00, and the American producer could sell it for $1.00. Would it be worth his while to invest money in the business of producing iodine in this country? And I ask you, wouldn't he be a fool to do it because he would know that the very day he offered his first gallon of iodine at $1.00, he would be undersold by the Chile producer?

A. Well, if he positively knew that, and he was—

The Court: Q. What would you do?

A. Well, if I positively knew—

Mr. Chaffetz: Q. Would you positively have to know it before you decided not to go into business?

A. I think so.

Q. You wouldn't go into that business unless you were positive that the facts I stated were true?

A. You would have to know how much money you would have to invest to go into that business.

Q. Suppose it would be a small investment.

A. If it were small enough, he might go in just to make a few days' sales, yes. There are all kinds of people in this world. Some are willing
2744 to take a profit for a day, and be done. And some are—if it was a matter involving a $50,000,000 investment, he would have to think it over very, very carefully and consider it from all angles.

For example, take the people that are picking up coal over in the—truckers that are hauling coal in here all the time. They get an old truck and they make a trip out to some coal field, pick up a load of coal and come in and sell it. They are not trying to establish a brand name for some particular owner. They will take a profit on one load—

The Court: We are not talking about the trucking business. We are talking about the oil business.

The Witness: We have hundreds of little refiners—

Mr. Chaffetz: Q. What percentage of all the gasoline sold in the Indiana territory is sold under brand name of a large distributor?

A. I should think perhaps ¾.

Q. Wouldn't you think it was much more than that?

A. No, I wouldn't think so.

Q. Wouldn't you think it was 85%.

A. I wouldn't think it would be much over
2745 75%, but it might be as high as 80% or more.

Q. Or 85%?

A. Well, I really would not—now, when you say a branded name, a major company?

Q. Either a major company brand name or a well-established company like the National and the Deep Rock—I don't know whether you consider the Deep Rock as a major—other companies who have an established brand name.

A. Somewhere in the range of 75% to 85%, ordinarily.

Q. So that by far the great bulk of the business done in this area is done in branded products; isn't that right?

A. Branded, yes, but I mentioned the case of Detroit, where no—where there was a difference between—

Q. Well, we will call it a national brand or a sectionally branded product, if you insist.

A. Yes, I think 75% or more.

But a company wanting to establish any substantial business in this area would not have to do business with distributors dealing in branded products, indeed not. The possibilities of selling to cut-price marketers are very great. If there is somebody holding up the high price,
that would be the ideal way to come in. One little
2746 service station can get a very large volume of gasoline.
Now, that little service station doesn't require a big investment.

The cut-price marketer hasn't driven the branded product marketer out of business because the branded price of the branded marketer has not been high enough, in general, to permit the unbranded product to be sold at enough lower than the price of the branded products to change that volume as much as that. But whenever the price cutter gets the advantage of a few cents differential, or even 1½¢ or 2¢, he rapidly becomes a very important factor in that market.

Now, then, under the assumption that here is maintained a high and artificial price, the percentage that the unbranded cut-price marketer would soon have in that market would be tremendous, just as it was in the case that I mentioned, where the price cut was relative to the other price in the area. It would be a question of degree, depending on the amount of differential that he could offer to the customer.

Q. In some cases he already offers and has constantly offered as much as ½¢?

A. Yes.

Q. Or 1¢? And there are areas where there are cut-price marketers offering as much as 2¢ differential?

2747 A. Not necessarily 2¢ below the comparable product of major companies. You see, you are talking about two different grades of gasoline when you talk about those differentials.

Now, the cut-price marketer doesn't sell ordinarily a high octane, leaded gasoline. He sells what in the trade is known as third grade gasoline; and the price that he sells at, as compared with the price at which the major company sells its third grade gasoline, is rarely very far apart. Now, if he cuts his third grade price 2¢ or 3¢ below the third grade price of the major company, he would get a whale of a business.

He would begin to get—these things are rapidly convertible into one another. I mean, the regular brand business would soon drop down with the third grade business. I believe that the refiners in the Louisiana-Arkansas field think of their normal marketing territory as over to the east there. If I may illustrate,—largely in this section here (indicating). They do sell some up this way, for example, in Ohio. There is a certain amount of gasoline goes from the refiners in this group into Ohio, you might say just beyond the Indiana territory here.

2748 I would say that the normal marketing area of the refiners located in Montana and Wyoming would be in the states themselves and in the western portion of North Dakota, South Dakota and Nebraska.

The Rocky Mountains come down in here (indicating), and there isn't much gasoline that moves across the Rocky Mountains.

Generally speaking, the side west of the Rockies would be supplied from the Pacific Coast; but east of the Rockies, from the east.

Q. Is there enough gasoline produced in the states of Montana and Wyoming to meet the needs of those states and also to supply a substantial part of the—any substantial part of the needs of the Indiana territory?

Montana had a capacity to refine 26,600 barrels a day of crude oil. And Wyoming—this is the beginning of 1936—had a capacity of 51,430 barrels a day. That makes a total of 78,000 barrels a day. And 50% yield—that would be about, roughly, 40,000 barrels of gasoline a day.

Q. Is that gasoline you are talking about now gasoline produced out of crude produced in those states?

A. I will have to go another step and look up the

2749 production in those states. I think, as a matter of fact, I should say that there is more crude produced in those states than is refined in those states.

I translated capacity in barrels per day of crude oil into gasoline by assuming a 50% yield. Now, in Montana gasoline consumption was—(computing) well, the way these figures work out, they had a capacity to make 584,000,000 gallons. And the total consumption in the state was 167,000,000; which would make it appear that they had a capacity of about 3 to 4 times the consumption in those states.

I said I think that goes—you see, these states (indicating on chart) are the most sparsely settled states in the country, and a good deal of it goes to the western part of these states and down into Denver, a fairly good center, and Salt Lake City. I dare say if I could draw a line, I would say about like that (indicating) would be the area.

That is a circle running over toward the edge of the Rockies. This is a pretty good territory over here—Eastern Idaho. In a general way, it covers the western part of those states. It is obvious that they don't sell it all in Wyoming and Montana. I took the consumption in Wyoming and Montana in 1936. I got those figures out of
2750 this book, which is tax figures for those states. We have got a capacity of 40,000 barrels a day of gasoline, running 365 days a year. Refiners run on Sunday.

The Court: Q. I want to know the amount that is produced in those states compared with the amount consumed.

On January 1, 1936, daily average crude runs to stills were about 2,750,000 barrels, indicating that the operating plants run about 73% of capacity. I don't know anything about the price of crude refined in Montana. I don't know anything about the cost of plants in those states compared with the states in the Mid-Western territory. I should think that the retail price of gasoline in Montana would be higher than in other parts of the country because of the distance from the center of the crude business of the industry. Completing the figures that your Honor asked for, we found a gasoline production capacity of 40,000 barrels a day, assuming 50% yield. That, I feel, is conservative. That makes 40,000 barrels a day for 365 days. I make it to be 14,600,000 barrels. Every one of those barrels has 42 gallons, but, with Mr. Chaffetz' permission, I will use 40. I still make that to be 584 million gallons. We have to take 73% of that. I will use 70 for round figures. I make that to be 408 million gallons plus.

2751 Now, the consumption in those states for 1936, reading from this book which is taken from the tax figures, Wyoming, 58,000,000 gallons, and Montana with 109,-

000,000 gallons, which, added together, make 167,000,000 gallons, plus the odd numbers. That is about 16—about something like—well, around a little over ⅓ of this capacity, so that refining capacity there would supply the states almost 3 times over.

So I should say that supply now goes partly into North Dakota, the western part of South Dakota, Nebraska, Colorado, Idaho, and Colorado—or Utah.

The retail price of gasoline generally throughout this area, Montana, Wyoming, Idaho and so forth, is higher than the retail price over the central portion of the Indiana territory—considerably higher, I would not say—several cents higher. Yet the producers and refiners in those Western states might sell in the Indiana territory. They might have sold all they could in their own territory, but continue to take a little lower price in the Indiana territory, provided it was a remunerative price. That would be true no matter whether you had a high and arbitrary price in the Indiana territory or not. The higher it was, the more attractive it would be. It might get high enough so they would be willing to leave off sales in the area they had been selling and move into the new area. They
2752 might increase their runs if there was an incentive to make more gasoline. With a 73% of capacity, they could increase their output and get hold of some new business and still have their own. That would depend on what it would cost to produce gasoline in Montana and Wyoming and the price in the area they were going to ship to. The price in Montana and Wyoming is higher than Wisconsin because the price on practically all products that have to be shipped farther is higher.

Q. They don't have to go farther. Take the gasoline that is produced by refiners located at Billings, Montana. They put it in their trucks and truck it around. They wouldn't have any freight at all. I understand from you that the price he gets is probably higher than the price the dealer in Madison gets for gasoline that comes from Oklahoma?

A. Well, I have said I don't know what the prices are there. My opinion would be that they would be higher out there in general than in a thickly populated section of the country. If you have ever been in Montana, you know you couldn't have a very concentrated distribution of gasoline. You might have to haul it 40 miles from one city to another.

2753 Hauling cost is bound to be reflected in the general price level in the area. It is not necessarily cheaper to haul by truck in Montana than by tank car through Oklahoma to Madison—not over those mountains. The retail price prevailing in the Indiana territory is lower than the prices prevailing in the country as a whole. That is because the Indiana territory is closer to the largest sources of supply of raw materials. By the same token, the price in the Dakotas, being farther away, is relatively higher. It is true that it is the farness away from the principal source of raw material, and not the trucking over the mountains, that creates the higher price. Generally speaking, the price should be lower in the Indiana territory as a whole, but not in Dakota. It is unlikely that the Western refiner would ship to Madison or Chicago. I think he would be more sensible to stop at Minneapolis. He normally gets a higher price in Montana than the Indiana company gets in the Indiana territory, but he is always shipping a part into this area, which indicates that in general he is able to do that.

Now, if this price is raised, it just means he can go that much farther. How much farther he can go depends on how much it was raised, but certainly if the price were raised, he can do it, because the capacity is there, and the incentive is there.

2754 Q. And you wouldn't know from the facts we have got on this record so far whether these refiners in Montana and Wyoming are not now getting rid of their surplus production in the states of North Dakota and South Dakota at lower prices than they are getting for the greater bulk of it trucked in their home territory?

A. No, I wouldn't know.

Q. They may be already getting rid of their surplus by selling at a lower price in North Dakota and South Dakota?

A. You asked me to assume they were operating at a 73% capacity. Then by that token they would have 27% more to invade farther east.

Q. That again would depend on the nature of that 27% of capacity that was left?

A. Yes. I do not mean that those plants could produce during the year 365 times the capacity for one day, nor to convey the impression that they could operate at 100%. We mustn't get the impression,

however, that they can only operate on an average of 73%. I think a refinery could operate above 90% of its rated capacity, on the average. Generally speaking, there is no difficulty in a refinery getting
2755 all the crude it wants. There might be an exception here and there.

Q. Assuming the prevailing retail price in the Indiana territory was ½¢ below the average prevailing retail price in the remoter states like Montana and Wyoming on the one side and Kentucky, Ohio, and Pennsylvania on the other side, could not the price of gasoline in the Indiana territory be raised that ½¢ before companies in those other territories would be persuaded to come in there to compete?

The assumption that the price in the Indiana territory was ½¢ below the areas around the fringe of it is one that does not exist. Generally speaking, the retail price in the Indiana territory was lower than the rest of the country as a whole, but not lower than the fringe around the territory. I would say it would be the opposite of that. I think the retail price in Ohio would be a little lower than in the Indiana territory. In the western part of Kentucky, in the mountainous section where transportation is difficult, the price might be higher. In terms of transportation, those states are not farther away from Oklahoma and East Texas than the states of Illinois and
2756 Wisconsin. In order to compare prices in the Indiana territory and elsewhere, I have considered 40 cities outside this territory and 10 cities inside. That is more or less standard—50 cities. It is the index that most people look to as an index of prices—50 cities, one in each state in the Union and two extra. In 1934, in the 40 cities outside the Indiana territory, exclusive of tax, regular grade gasoline was 13.74¢ a gallon. In the next year, 1935, it dropped to 13.67¢. That was a decline of .07¢. Now, in the 10 cities inside the Indiana territory, the average price in 1934 was 13.23¢. In 1935 it was 13.05¢, so that it dropped .18¢. The price within the area dropped lower in 1935, as compared with 1934, than the price outside did. During 1935, I don't believe prices increased in this territory, that is, for the year. I know the prices were higher during parts of 1935 than they were during parts of 1934. About the first of March, 1935, the price began to increase in the Indiana territory and everywhere else, I should say, as compared with the immediately proceeding period. My information

is that the price increased less in the Indiana terri-
2757 tory during that year than the retail price increased
for the country as a whole.

The question was: How did the price within this area, the increase in the price within this area between March 1st and June 1st compare with the increase in price outside the area between the same dates?

Now, I had an index of 50 city prices that has been considered standard for this industry for many years. I took the ten cities inside the area and compared the price there with the forty cities outside the area. Inside the area the average price on March 1st was 12.63¢ per gallon. On June 1st it had increased to 13.35¢, which is an increase of 72/100 of 1¢. In the forty cities outside this area the price on March 1st averaged 13.26¢, and by June 1st it had increased to 14¢, an increase of 74 points, or slightly greater than within the area between the same dates. These are the ten cities that have been used for years in this industry.

Gasoline produced in Oklahoma, Kansas and Texas has an effect on the price of gasoline in areas other than the Indiana territory and other than the states where produced. If prices were unduly depressed in Oklahoma, that would tend to bring down the prices elsewhere—for example, down
the coast and also on the Atlantic seaboard—through
2758 a chain of effects. I am referring to general prices.
The retail price in Oklahoma would hardly affect the retail price on the Atlantic coast.

I have with me a form of a Fleetwing jobber contract in Michigan. It is not a contract with anybody. On the outside I see the name "Orion Gas & Oil Company." That is physically attached. It is not a part of the contract. That is just a form, simply a piece of paper, I would say. I do not know whether it is the form of a contract between our company and the Orion Gas & Oil Company. I am familiar with the jobber contracts of our company in a general way. The provision of the contract beginning "Provided, however," which is a part of Section 3, "Prices Payable," is, I suppose, in general similar to the ones we use in Michigan. That paragraph provides that if the price we charge does not net them back at least 5½¢ under the service station price, they are to get some special concession, I believe. That is under the service station price of the Standard of Indiana. In other words, if the price we charge does not give them a 5½¢ margin under that price, we will lower the price we charge. It does not say that we guarantee the jobber a 5½¢ margin below the 2759 Standard of Indiana price (retail service station price). It says that if it does not net him that much, we will refund to him one half of the amount of the deficit below that. It is the so-called split provision. It is a guarantee of 5½¢, subject to a split. It does not guarantee a full margin. It is based on the normal prevailing retail price or the actual prevailing retail price. We do not have our own retail price, so we have to refer to somebody else's retail price.

Q. Do you know what the policy of the Standard of Indiana was in 1935 in posting its retail prices in the Indiana territory?

A. Well, I know that it had a different policy in Michigan and Detroit than it did elsewhere. That is my understanding at any rate.

I think the policy in Michigan was to meet the price that competition showed was necessary to have. I do not think the policy differed at all in Michigan in principle from the rest of the Indiana territory, except that prices in Detroit - - - it would be more difficult to collect a price representing the full freight differential over Group 3 than elsewhere, that is all.

I think all the Standard of Indiana did in any state was to meet competition. I think prices everywhere have to be based on what you can get.

2760 *Redirect Examination by Mr. Kirkland.*

The Standard of Ohio is an entirely separate company from Standard of Indiana. There is no stock relationship between the two that I know of.

This reference in our jobber contract to the price of Standard of Indiana was put in there without any consultation with Standard of Indiana, just as we have many contracts specifying our price in Ohio, simply because we are the price leader in Ohio just as the Standard Oil Company of Indiana would be in Michigan, I would say. And if you want to make prices in a contract that has reference to some retail prices, then you have got to refer to some prices that are well known, somebody that covers the territory. There is nothing sinister about that, and if that impression has been created I want to—

Recross Examination by Mr. Chaffets.

Q. You say your company is entirely disassociated from the Standard of Indiana?

A. Yes, sir.

Q. You do not go so far as to say there are no common stock holders?

A. People that own stock in both companies?

Q. Yes.

2761 A. Oh, I think there are several people—I own stock in several companies.

Q. Do you know the dominant stockholders in the two companies, who they are?

A. I suppose you refer to the Rockefeller Group.

Q. I was going to ask you whether you know there is a similar dominant stock-holding influence in both companies.

A. I think in general the Rockefeller interests, so-called—that is rather a loose term—for example, Chicago University which owns a good deal of stock in our company, and I imagine it owns some in Indiana. Now, that is an educational institution that was endowed by Mr. Rockefeller. I do not believe Mr. Rockefeller—what he has to do with that money now, I don't know.

The Rockefeller Foundation, which is a foundation devoted entirely to research in the field of medicine, I believe, and in other things,—purely a philanthropic institution—also owns stock in our company, and it depends upon dividends from our company, among others, for doing that type of work.

Mr. John D. Rockefeller, Jr., I don't know whether he owns any stock in our company or not. 2762 I don't know whether he owns any in the Standard Oil of Indiana or not.

I believe at one time there was an attempt made to put together all those interests that at one time or another had had some connection with the Rockefeller family, and as I recall it at that time those represented about 20% of the stock of our company, but that was before we increased the stock by about 50%, so I imagine here now that would be down to say 15%, or something of that sort.

Q. Is there any other larger interest, larger group, interested in the company?

A. Well, I don't know as to that.

(Witness excused.)

2763 Mr. Donovan: Now, your Honor, without objection by counsel for the Government, in order that there be no question on these tabulations here if some of them might be inaccurate, I would like to put in as Exhibits 943 and 944, which relate to the figures upon which these tabulations are based, and the conditions there. These are the 1935 and 1936 circulars of the Department of the Interior on the Petroleum Refineries in this country.

Mr. Chaffetz: I would rather not have those go into the record, because I do not want to have to take the trouble to study them and deal with everything in there that may not deal with this case. There is a lot of that kind of material. Some of it was offered at one time by Mr. Francis. It is not necessary.

We asked they be put in subject to check, and if either side find any errors at any time I have no objection, but I see no reason for putting in the basic documents, some of them voluminous, from which that particular information came in.

The Court: I don't really see any need of adding this to the record. We have the facts, and if there is any dispute as to the facts, then we can put them in; but for the time being, I don't see any necessity for them.

Mr. Donovan: All right, your Honor.

2764 ARTHUR P. DYER, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Dallas, Texas. I am district manager of the Southwest Pump Company, a manufacturer of service station pumps, airport gasoline equipment, and so forth.

From 1922 till 1933 I was sales manager for Oriental Oil Company, an independent company in Dallas. Then for a year I was an independent jobber in Dallas. Then I was associated with Waverly Oil Works Company of Pittsburgh, and Pennzoil Company of Oil City, Pennsylvania.

During the first part of 1935, until March 1st, I was the field representative for the State Chairman for Marketing under the Petroleum Code and then I became the State Chairman myself. After the discontinuance of the Code, and for the remainder of 1935, I conducted a statistical bureau for the principal purpose of investigating marketing conditions in Texas, furnishing that information to the subscribers.

Under the Oil Code, all during 1935 and since the late summer of 1934, our principal activity was price stabilization work. This involved working with independent refiners operating in East Texas. In Texas the practice
2765 is to engage in what we call dock sales. That is where
a trucker comes to a refinery and buys a truck load of gasoline at or about the same price that another customer probably would pay for it in a tank car. Therefore it was necessary to work with those refiners. Many of them were on our Stabilization Committees.

Our work at that time brought us into contact with the refineries operating in East Texas, because hot gasoline made it an almost insurmountable task to try to do anything with gasoline prices, and therefore we worked with them in an effort to get their cooperation in this work.

As to this hot gasoline problem, I was talking about 1934 and 1935. After March 1, 1935, hot gasoline continued to be manufactured in East Texas, but virtually none of this gasoline moved out of Texas in interstate commerce. That was due to the effectiveness of the Connally Act, which went into effect approximately March 1st, and the operations of the Federal Tender Board. The railroads were prohibited from transporting gasoline without Federal tenders. After March 1st, hot gasoline was a market factor within Texas. I know how much hot gasoline moved out of Texas in January and February, 1935.

Section 9 (c) of the National Industrial Recovery Act provided for the prevention of the shipment in interstate commerce of crude oil or its products made in excess of state allowabies. That would be a definition of hot
2766 gasoline. Under that Section, a Federal authority
was set up in Texas to control the shipment in interstate commerce of hot gasoline. A Federal Tender Board was set up at Kilgore, Texas, in October, 1934. The Board operated until January 7, 1935.

I found from my investigation that shipments of hot gasoline were made in interstate commerce after January 7, 1935. Such shipments were made January 9th.

On January 7th the Supreme Court of the United States declared Section 9 (c) of the N. I. R. A. unconstitutional. For a short while, through the unusually active efforts of the Railroad Commission of Texas, a great deal of hot gasoline did not move in interstate commerce. But that was a very temporary situation. It lasted for 6 or 7 days.

I have the names of the independent refiners who are alleged in the indictment as members of the East Texas Refiners' Marketing Association. I have made an investigation to determine the amount of gasoline sold by these refiners during the 4 months prior and during the 4 months subsequent to March 1, 1935.

In order to determine the amount of gasoline sold in East Texas, the records of the Federal Tender Board were investigated for the purpose of determining the number of tank cars of gasoline which were shipped. The records of the Railroad Commission also were used as a check. The
State Comptroller's office of Texas was used for the
2767 purpose of determining the taxes paid on all gasoline
shipped by the refiner, and particularly the amount that he sold in truck quantities. Any figure that I quote, of course, is the minimum figure, because if there were many tax evasions or shipment by subterfuge, that is, gasoline billed as crude tops, or something of that kind, it won't show in my figures. The records of the Railroad Commission of Texas to which I refer are in my possession.

The members of the East Texas Refiners' Association named in the indictment shipped 56,473,956 gallons of gasoline during the 4 months preceding March 1, 1935. These same refiners sold during the 4 months after March 1, 1935, that is, during March, April, May and June, 81,299,358 gallons. This was an increase of 24,825,402 gallons.

Not all of these companies were operating during the period of 4 months prior and 4 months subsequent to March 1, 1935. Matthews and Premier did not sell any gasoline. Solvex and Cascade did not operate. Wabash sold only in November, 1934, and June, 1935.

During the year 1935 these members of the East Texas Refiners' Association sold 285,592,188 gallons. The amount of gasoline sold during 1935 by all refiners operating in the East Texas field was 378,920,346 gallons.

I have examined my records that show the ship-
2768 ments of hot gasoline made in January and February,
1935 from East Texas into the Mid-Western area as distinguished from interstate shipments of hot gasoline as a whole. I understand the Mid-Western area to be the Standard of Indiana territory. I have the Railroad Commission records here.

The total amount of hot gasoline shipped into the mid-western area, as indicated by my records, in January, 1935, was 116 cars or 933,800 gallons. The first of those shipments occurred on January 9th. 25 cars were shipped on that date. That was two days after the decision of the

Supreme Court knocking out Section 9 (c) of the National Industrial Recovery Act.

The remainder of the shipments of hot gasoline made during January occurred on the 14th, 4 cars; on the 15th, 1 car; on the 16th, 5 cars; on the 17th, 9 cars; and on the 19th, 1 car; and from January 20th through the 31st inclusive there were 71 more cars shipped, making the total of 116 cars. The bulk of those shipments of hot gasoline during January, 1935, occurred during the last 10 or 14 days of that month. 61% was shipped the last 10 days.

There were 287 cars, or 2,310,250 gallons, of hot gasoline shipped out of East Texas into Mid-Western area during February, 1935.

Comparing those amounts of hot gasoline shipped
2769 into the Mid-Western area with the total hot gasoline
shipped in interstate commerce during those two months as shown by my records, there were 116 cars of hot gasoline shipped into the Mid-Western area against a total of 118 cars in January; and in February there were 287 cars of hot gasoline shipped into the Mid-Western area as compared with the total of 317 cars. The bulk of those shipments was in the Mid-Western area.

I determined whether or not particular shipments of gasoline during January and February, 1935, were shipments of hot gasoline from the records of the Texas Railroad Commission's tender board at Kilgore which show the number of tank cars of gasoline that are shipped. In selecting the refiners whose shipments I have quoted here, I took those where the records reflected that no tender, either crude or products tender, had been issued to that refiner. Those are State tenders, and, of course, were the only tenders effective during this particular period, because the Federal Act had been knocked out. The Railroad Commission of Texas issues tenders to refiners who can prove that the products from which they are going to refine their gasoline were legally produced, that is, produced within the state allowable.

In February that same method was followed with the exception of one refiner, and in his case he showed that he
had a State tender, which of course was still the
2770 tender effective in February. He had some State
tenders, but he had shipped far in excess of his state tenders, so in selecting the tank cars of that refiner, I selected only those that were shipped under a restraining order by the court. That was a practice indulged in extensively during that period by refiners in East Texas who wanted to move hot gasoline. It was a mere subterfuge,

and by the time the injunction proceedings would be acted on, of course, all of his gasoline would be shipped, and therefore the court action came to naught. It was the natural deduction, of course, that if a shipper had no tender of any kind or sort, the gasoline must have been hot gasoline.

The figures I have just given reflect probably a small amount of the total of hot gasoline that was shipped in the Mid-Western area, because there were a number of subterfuges indulged in by refiners at that time such as billing gasoline as crude tops to some intrastate point in Texas, then rebilling it, and shipping it out of the State when they got away from the jurisdiction of the State tender board. Then there was a practice of shipping gasoline by truck to the state line, piping it across, putting it in tank cars and re-billing it to other points in the United States. That was practiced particularly on the Louisiana-Texas border.

2771 There was quite a bit of activity along that line in January and February, 1935. I only specifically remember one case, because it was the first case filed under the Connally Act, which was signed and actually became effective on February 22nd, although the Federal Tender Board did not begin to operate in East Texas until about March 1st or 2nd; but during that period suit was filed in the Western District of Louisiana against 8 truckers for transporting illegal products to the Texas-Louisiana line, and there piping it across that line, putting it into tank cars, and reshipping it. It was hauled by the truckers, as the newspaper account at the time stated, within a few inches of the Louisiana line, the trucks remaining on the Texas side.

The records as I examine them show no shipments of hot gasoline between January 1 and January 7, 1935. During that period there was a Federal Tender Board operating in East Texas under Section 9 (c) of the N. I. R. A. That Federal Tender Board was brought to an end by a decision of the Supreme Court on January 9th.

On March 1st the Federal Tender Board went into operation in East Texas under the Connally Act, and there were no further shipments of hot gasoline out of East Texas. I made an examination upon which I base the statement that there were no shipments of hot gasoline out of East Texas after the Federal Board went into operation on March

2772 1st. We have a record of all refiners who were operating under Federal tenders. I examined the Railroad Commission records first to determine all refiners who were shipping in tank car lots out of East Texas. I then compared that list of refiners with the list of refiners who were shipping on Federal tenders. There were 2 or 3, who had shipped in tank car lots but who did not have Federal tenders. I, therefore, checked their shipments and found that none of those tank car shipments had been interstate; they were intrastate shipments.

After March 1st the interstate shipments were made under Federal tenders. Under the Connally Act, the railroads would not accept shipments of gasoline without a Federal tender; and the Federal Tender Board, of course, would not issue a tender if the gasoline was hot.

During July, August, September and October 1935 those refiners shipped 114,209,676 gallons of gasoline. It was an increase over the previous 4 months of 32,910,318 gallons.

The amount of gasoline shipped by these refiners during the next 4 months from November 1, 1935 to the end of February, 1936 was 99,654,308 gallons. That is a decrease of 14,555,368 gallons over the previous 4 months. These shipments in this period, that is, the last four months, show an increase of 43,180,353 gallons over the same 2773 period of 4 months the year before.

These figures indicate that in each of the 3 four months' periods following March 1, 1935 the amount of gasoline shipped by the members of the East Texas Refiners' Marketing Association named in the indictment was greater by at least 24,000,000 gallons than the amount of gasoline shipped by these refiners during the 4 months period prior to March 1, 1935.

Cross-Examination by Mr. Chaffetz.

These shipments that I speak of by members of the Association are not only interstate shipments; these are their total shipments. I do not have figures to show what their interstate shipments were during the same period. That includes all of their shipments, truck and tank car. I would hesitate to say exactly how much of intrastate truck shipments is in those figures. That varies, of course, with the refiners. Some of them aren't even on a railroad, and would probably ship a large portion of their stuff by truck; whereas, on the other hand, some of them didn't ship any by truck at all but shipped entirely by tank car, and that was particularly true of some of the larger ones.

I did not give testimony about non-members of the East Texas Refiners' Association. I gave the total ship-2774 ments in 1935 of the members of the Association and the total shipments of all refiners operating in East

Texas, including non-members. I could not tell you who the non-members were without looking at the record on it. Among those non-members there were many refiners who didn't ship any at all in interstate commerce. That was not true of most of the non-members of the East Texas Refiners' Association after March 1, 1935.

I cannot name some of the non-members of the Association who shipped in interstate commerce without checking the record each month to determine where their shipments went. Specifically, I couldn't state who made these shipments that I say were fraudulently described in the bills of lading as gasoline when they weren't gasoline, and I couldn't even state whether or not they were made by members of this Association. I have no specific information about those shipments at all. I just remember that cases were filed against them. In fact, I think there were 102 cars at one time shipped from East Texas to Waco, Texas, which were misbilled. That was intrastate. The idea was that possibly they were going to re-bill it, but they happened to catch that shipment and stop it. That was just the common supposition. It was to get it away from the jurisdiction of the State Tender Board, and we only had the State Tender Board at Kilgore. Products shipped from North Texas and West Texas weren't shipped under
2775 tenders.

I could name some destination points of the hot oil shipments in January and February, 1935 that were into the Indiana territory; I have the records that show who the purchasers were. Those records will be available to representatives of the Government to examine sometime today.

2776 **FRED VAN COVERN**, a witness for the defendants, testified as follows:

Direct Examination by Mr. Francis.

I live in New York. I was connected with the Planning and Coordination Committee during the entire period of the Code, which went up to the Supreme Court's decision of May 28, 1935. I was a member and secretary of the Statistical Sub-Committee, and also a member and secretary of the National Gasoline Inventory Committee.

I am familiar with the telegrams which have been testified about here which were sent out to different refiners on March 9, 1935, by John Shatford, and to which he signed the name of Howard Bennette, National Coordinator.

I remember receiving a reply to that telegram which Mr. Shatford sent to The Pure Oil Company. The reply telegram was signed C. B. Watson for The Pure Oil Company.

(Document handed to witness)

This is the original telegram which I received in reply. My own pencil notations are at the bottom of it.

Mr. Francis: Now, your Honor, without using the original telegram which I want to keep, I want to offer a photostatic copy of that telegram which I offered as EXHIBIT 851, but which counsel objected to as not being properly identified. I now want to

2777 offer it as being properly identified by this witness.

Mr. Chaffetz: No, your Honor, the real ground of our objection wasn't that it wasn't properly identified. We didn't object to the use of the photostat, and bringing this witness doesn't meet our real objection at all.

We say it is a self-serving statement of one of the defendants, made by one of the defendants, and offered through a third party to prove the truth of what is stated in it.

It is pure hearsay, and if that is admissible, then I suppose we could have any number of witnesses coming in to tell us what different defendants said to them during the period of the conspiracy, all self-serving statements, without any chance for the Government to cross-examine the persons making the statement with regard to the truth of what was said.

There is no theory that I can conceive of, on which that kind of statement may be admissible.

The Court: Oh, I think everything you have in here is on those charts.

Mr. Francis: I think it is too, Judge. I was just trying to support them.

The Court: But I think, while this is offered in corroboration, nevertheless, I think the objection will be sustained. Exception allowed.

2778 *By Mr. Donovan*

I have been in the oil business about 21 years. Very early in 1917 I took a position with Carter Oil Company in New York, where I remained until late in 1919. During that time I did statistical and map work in connection with the production of oil, and spent a very short time in the producing fields of Mexico.

Late in 1919 I went to work in the fields in the eastern United States, in production, drilling and natural gasoline work, and also pipe lines, for just over 2 years.

During that time, I studied the oil business. I was sent into the field for that purpose. I did everything. I unloaded freight cars, roustabouted, worked on producing wells, handled the drill stem for a while, and did pipe line work and natural gasoline work.

After 2 years in that work, I was sent to Rumania by Standard Oil Company of New Jersey, and worked there for the Romano-Americana. In Rumania I worked for 2 years in pipe line work, in connection with drilling and production. Then I went to Poland to work for the Standard Oil Company of New Jersey subsidiary, which was called Olej Skalny, as assistant field superintendent in charge of drilling and production.

After leaving Poland in late 1923 I returned to New
York and took a position with the American Petro-
2779 leum Institute, where I have been until now, with the
exception of the period from late 1933 until the middle of 1935. I was during that time on leave of absence from the Institute to take charge of the Department of Statistics of the Planning and Coordination Committee. During that time, however, I remained in charge of statistics for the Institute.

The American Petroleum Institute is a national association of the petroleum industry. The members of the Institute are individuals connected with the petroleum industry or allied industries. I am acquainted with most of the individual defendants in this case. I think most of these individual defendants are members of the American Petroleum Institute.

The Institute has approximately 3,000 members. It is financed by membership fees paid by its members and also through contributions by companies in the industry. I think most of the defendant companies here made contributions to the support of that Institute.

I was not a member of the Planning and Coordination Committee. I was a member and secretary of the Statistical Sub-Committee; a member and secretary of the National Gasoline Inventory Committee; also a member of the Refinery Sub-Committee; a member of the Program Committee, and also assistant treasurer of the P. and C. Committee.

The Program Committee was a group or committee
2780 set up to carry out the details of the France buying program.

I went to the American Petroleum Institute as an assistant statistician, and worked as such for about 2 years, and then became head of the department. I am still head of the department, with the title of director of the Department of Statistics.

In the Department of Statistics we collect, compile and interpret for our own use all kinds of statistics relative to the operating phases of the industry, such as gasoline production, gasoline stocks, crude oil production, cracked gasoline production, stocks of fuel oil, and stocks of gasoline, and make a detailed study each week, by fields, in the United States, of the amount of crude oil produced in each. We also collect and compile a complete refinery report, showing crude runs to stills, cracked gasoline production, gasoline stocks, and gas and fuel oil stocks. Then, also, we gather information such as the Bureau of Mines publishes in its regular monthly and annual statistical summary. We also interpret those figures for use by the officers of the Institute.

During the 13 years that I have been with the American Petroleum Institute, I have been continuously engaged in the statistical work I have described, and I have directed my attention particularly to the statistical position of
2781 the petroleum industry. I have been able to tell from
my observation when the industry was in good statistical position, and therefore on a profitable basis, or in a bad statistical position. There are very definite signs and details and relationships that we watch in order to determine whether or not the industry is in a sound statistical position.

The factors we observe with reference to the statistical position are the relationship between the price of gasoline and the price of crude oil, and the relationship between the current production of gasoline and the inventories of that product in relation to the demand for gasoline. We also set up for ourselves what we think are minimum required levels of operations, levels under which the industry can conveniently and economically operate. We also watch the relationship between the current production of crude oil and the demand for crude oil, and the trend of inventories of that raw material. We always use those several items in order to determine whether the industry is in a condition of balance or of unbalance.

We have to watch the raw material, that is, crude oil, as well as the refined products, because there are instances where the crude oil position or picture, as such, might denote strength, and you might think the industry was in a
strong position, if you only looked at the crude oil
2782 situation. But if you go over into the product situ-
ation you can see where there is real weakness, and
the reason why the strength in the crude oil situation has not made itself felt otherwise.

My opinion for that is that you take the situation in crude oil and, if I may speak of the present time, we say that the crude oil picture as such is strong. It denotes real strength. But if you look over into the product situation you find that there is weakness there.

In summing up the effect of all forces upon the economic condition of the industry you have to look at the entire picture of the industry before you can find the answer to what might appear to be a simple question. If the supply of raw material overbalances the demand for refined products, the situation that usually follows is an unstable condition. If more crude oil is forced upon refiners than the market can absorb, they are inclined to run it and build up inventories to such an extent that it forces refined products on the market and price instability results. If too much gasoline is forced on the market the result is price disturbance. That means lowering of prices. Very many times it lowers the price considerably. Many times that has lowered prices below profitable levels.

In determining whether or not the petroleum industry is in a good statistical condition, one should watch both products and crude oil. One should watch the production
of gasoline and other products in relation to demand
2783 and inventories thereof, as well as the same for other
products. And one should always watch the current rate of production of crude oil, the demand for crude oil, both in the domestic and export market, and particularly the trend of stocks of raw material. The trend of gasoline inventories as well as other product inventories is very, very important, particularly should they go counter-seasonal.

In watching this statistical position that I have just described as I have been doing for 13 years, I have had an opportunity to observe the effect of the national statistical position of the industry upon an area such as the so-called Standard of Indiana territory, because the national picture ties into a whole. Usually when the national picture is out of whack, it means that other districts are out of whack, and then when it is only related to one or two districts it usually spreads and the effect is cumulative, and a bad condition throughout results.

When the statistical position is absolutely in balance, that is, all factors working smoothly with each other, a condition of price stability usually exists. If such a condition exists over a long period of time, and, for instance, stocks of raw materials above ground are withdrawn heavily, there is usually an increase in the price. The conclusion from my experience in dealing with these
statistics is that in order to properly understand
2784 the statistical situation in the Mid-Western area, I
would be compelled to ascertain the facts in respect
to the country as a whole.

At the request of counsel for the defense I have prepared statistical data involving the factors that entered into the statistical position of the industry for the years 1935 and 1936. I have prepared a statement by months for those years showing the domestic demand for gasoline in the United States, and the export shipments of gasoline from the United States to foreign countries, and a total of that demand. I have also indicated the percentage change for each month, when compared with the corresponding month of the previous year on a total demand basis. The sources of this information were the American Petroleum Institute's Annual Statistical Bulletin, No. 16, of May 27, 1937. The basic information contained in that bulletin has been taken from the United States Bureau of Mines monthly petroleum summaries. That bulletin was prepared under my direction. I have with me one of the American Petroleum Institute Bulletins and the United States Bureau of Mines reports containing this basic material to which I referred. This is the tabulation that I have described.

(Tabulation referred to received in evidence as EXHIBIT 946.)

2785 At the left hand side of Exhibit 946 there are indicated the months of 1935 and 1936. The next column to the right indicates figures of domestic demand in barrels for each of those months. The third column shows the export shipments by months for these 2 years. And the fourth column is a total of both domestic and export demand. The column at the right hand side indicates the percentage change, showing the decrease or increase indicated in any given month, when compared with the corresponding month of the previous year.

The Exhibit shows that the demand during the month of January, 1935 was 4.8% below the demand in January, 1934.

The trend changed in February, 1935, that month showing a slight increase. The rate of increase itself increased during March and April. April, 1935 showed an increase in demand for gasoline of almost 6%, when compared with April of the previous year. The increase in demand for gasoline in May, 1935 was approximately 3%. The increase in June, 1935 was almost 7%, when compared with the previous corresponding period. We then jump up to very large increases, showing the demand for July, 1935, which registered an increase over the corresponding period of 1934 of 12.7%. The increase during August, 1935 was 10.6%, and in September, 1935 11.7%.

October, 1935 continued that high level, showing an
2786 increase of 10.6% above October, 1934. November,
1935 declined to 5%, but December registered an increase over December, 1934 of 14.7%.

It will be noted there that, during the high consuming season of 1935, there were increases registered anywhere from 10.6% to almost 13%; that December showed a record for the year of 14.7%. The year as a whole registered an increase of 7% when compared with 1934. I am talking about an increase in total gasoline demand upon refiners in the United States, both for domestic and export shipment.

The year 1936 opened with January continuing the trend established in December, 1935, the increase in the demand for gasoline during January, 1936 being 15½%. February, 1936 fell down to 3.8% due to the extreme weather of that month. There are specific reasons why that was. In March, 1936 the increase was 7.6%; while in April, 1936 9.3% more gasoline was shipped than in April, 1935, which itself indicated an increase of 6%. In May, 1936 we had an increase of 7.7%. Again, the high consuming season registered large increases. June, 1936 showed an increase of 13.6%; July, 1936, 10.1%; August, 1936, 5.6%; and September, 1936, 14%.

We note unusually large increases again in the high consuming season; and, comparing these 4 months with
the corresponding period of 1934, we find increases
2787 ranging during that 4 months period, June, July,
August and September, 1936, anywhere from 17 to 27% above the corresponding period 2 years previous.

In October, 1936 demand for gasoline increased 6.2%; in November, 1936, 8.6%; and in December, 1936, 11.8%;

or a total increase during 1936 of 9.5% immediately after 1935, indicating an increase of 7% over 1934. That completes the outstanding facts there.

I have had prepared under my supervision a chart which shows, both statistically and graphically, the consumption of gasoline in the United States as compared with the consumption of gasoline in the Mid-Western area for the period of 1930 through 1936. The source of the data used in showing the demand for the entire United States was taken from the United States Bureau of Mines monthly petroleum statements recomputed by the American Petroleum Institute, and so stated in the bulletin just referred to. The material for the Mid-Western area was taken from the A. P. I. gasoline consumption bulletins, which are published monthly.

We gather those figures from the state tax departments. Each month we send the state tax departments a questionnaire, asking them to report to us the total amount of gasoline taxed or inspected in their state. Those figures indicate the total amount of gasoline consumed in each state. During February, when the December 2788 figures become available, we compile tabulations and send to each state the figures that we have published during the year. We tell them that we are going to publish those figures in bulletin form and that the figures indicated on this sheet are those which we expect to include in that publication, and ask them to comment and say whether or not the figures truly reflect the demand in each of their states. If it doesn't, they have the opportunity to change the figures, which they do on occasions, and then we republish them in bulletin form.

I have those bulletins with me and they will be available to counsel for the Government. The chart to which I referred accurately records the statistical data contained in this source.

(Chart referred to is received in evidence as EXHIBIT 947.)

This chart, Exhibit 947, shows a comparison for the years 1930 through 1936 of the demand in the entire United States, which is the blue column, and in the Mid-Western ten-state area, which is the orange column, for each of those years. There is a scale along each side of the chart, indicated in millions of gallons, so that the tops of these columns can be read in gallons.

The long column to which I have referred is blue; and the short column to which I have referred is orange.

At the top of each long column, beginning with 1931, and at the top of each short column, beginning with
2789 1931, there is indicated the percentage of change that occurred during that year, when compared with the previous year.

We find in 1931 that the demand for gasoline in the entire United States increased about 2½% when compared with 1930. We find in the ten-state area, that is the Mid-Western area, that in 1931 demand there increased 4.4% when compared with 1930.

In 1932, the demand in the entire United States decreased 7.4%, when compared with the demand in the entire United States during 1931. While in 1932 the demand for gasoline in the Mid-Western area decreased approximately 9.4% when compared with 1931.

There was a greater decrease in the Mid-Western area in 1932 than there was in the entire United States. Just like in 1931, there was slightly greater increase in the demand in the Mid-Western area than there was in the country as a whole.

Coming to the year 1933, we find that demand in the entire United States increased 7/10 of 1% when compared with the demand in the United States in 1932. While in the Mid-Western area there was a decrease of 69/100 of 1%. In other words, there was a slight decrease just under 1% in the Mid-Western area in 1933, but for the United States as a whole there was an increase of approximately the same amount as that decrease, as
2790 compared with 1932. In the Mid-Western area the consumption slumped 7/10 of 1%, even more than in 1932.

In 1934 we find the beginning of several increases. The United States as a whole increased 7.8% when compared with 1933. Gasoline demand in the Mid-Western area in 1934 increased 6.6% when compared with the demand in 1933.

In 1935 we find that the demand in the entire United States increased almost 7% when compared with the previous year; and that in the Mid-Western area the demand increased approximately 6%.

We come to 1936 now, and find that in the United States as a whole demand increased 10.8%, approximately, when compared with 1935; and that demand in the Mid-Western area in 1936 increased 10.6%, approximately, when compared with 1935.

In other words, we had, beginning with 1933, a series of increases right through 1936, ranging from 6% to almost 11% for the country as a whole, whereas in the Mid-Western area we began a series of increases beginning in 1934, ranging between 6.6% and 10.6%.

I would say that generally speaking, and the figures bear it out, I think, the trend of gasoline consumption in the Mid-Western area follows the trend of gasoline consumption throughout the United States.

2791 I have made a tabulation comparing the gasoline forecast and the actual demand for 1935 and 1936. The figures on forecasts or expected gasoline demand for the months from January through June, 1935, are the figures distributed by the Petroleum Administrative Board; for the period from July, 1935, through 1936 they are the forecasts of the United States Bureau of Mines. The actual figures have been taken from the American Petroleum Institute's Annual Statistical Bulletin, Number 16, of May 27, 1937, the basic information contained therein being taken from the monthly and annual statistical summaries of the United States Bureau of Mines. That bulletin was prepared under my direction. I have with me the sources of the tabulations which I have just described. The tabulation to which I have referred accurately records the data which is contained in the source material.

(Document referred to is received in evidence as EXHIBIT 948.)

In January, 1935 the Bureau of Mines slightly under-estimated demand. In February, 1935 they slightly over-estimated demand. From then on through the rest of the year, with the one exception of September, the Bureau under-estimated demand. For example, in March they under-estimated demand by 1,500,000 barrels; May, approximately 2,000,000 barrels; July, 3,800,000 barrels; August, approximately 2,700,000 barrels; October, 4,350,000 barrels; in November, 2,300,000 barrels; and in 2792 December, about 2,000,000. Summing up the year, we find the Bureau under-estimated demand during 1935 by 20,000,000 barrels or 850,000,000 gallons.

In 1936, January shows that the forecast of the Bureau under-estimated demand by slightly over 2,000,000. During the following three months they anticipated a demand greater than the actual. In May, 1936 they changed the trend again, and in June, 1936 they forecast a demand which was 2,200,000 barrels, approximately, less than actual demand. In July, 1936 they missed it only slightly. In August, 1936, they forecast a demand somewhat greater than the actual demand. But for September, October, November, and December, 1936 they under-estimated demand. In other words, they forecast a demand less than the actual demand by various amounts, ranging from 1,400,000 barrels to almost 3,000,000 barrels a month. For 1936 as a whole the Bureau of Mines under-estimated the actual demand. In other words, their forecast of demand was 8,332,000 barrels less than the actual demand, or approximately 350,000,000 gallons.

I wouldn't say that the actual demand is usually higher than the estimated demand. I would say the Bureau of Mines had a very excellent reputation. I think they did an excellent job prior to this time. I can say that not only did the Bureau under-estimate demand, but I think
2793 practically all of us throughout the industry were
surprised at the unexpected increase in this demand. It was foreseen by a very, very small number of people.

I have prepared a tabulation dealing with gasoline inventories in the United States for the period from January 1, 1935 to December 31, 1936.

The United States Bureau of Mines sends a questionnaire each month to all refiners and all companies holding gasoline stocks in the United States. Among other things, they ask for figures on gasoline inventories as of the end of each month. Companies throughout the industry report that to the Bureau of Mines. That questionnaire asks for unfinished gasoline as well as for finished, and it asks for natural gasoline.

The figures show 58,600,000 barrels for January 31, 1935. Stocks increased during February. These figures do not include any figures on blended gasoline.

Unfinished gasoline is the amount of gasoline contained in naphtha distillates, both naphtha distillates and unfinished gasoline being unavailable in the market without further processing. In other words, they are not a finished motor fuel and must be sent through additional processes before being available for the market.

I have made a breakdown of these total gasoline inventories into stocks available for shipment and stocks unavailable for shipment. By stocks unavailable for
2794 shipment I mean the amount of gasoline that the
industry must retain in its plant and operating equipment, including pipe lines, tankers, barges, and other equipment in order that it may conveniently and economically operate. In other words its plant and equipment has to be full at all times before it can ship gasoline. A considerable amount of gasoline must remain in these

facilities if the industry is to continue to operate and supply gasoline to the motorists.

The first item of unavailable stocks is composed of gasoline which we call tank bottoms, that is, the amount of gasoline below the connection. It is allowed as more or less of a place for foreign matter and water to settle down in the bottom of the tank so that only pure gasoline may be withdrawn.

The second item for unavailable stocks is unblended and finished gasoline. These are various ingredients that go into the blend you buy at the corner filling station.

The third item is unavailable unfinished gasoline contained in naphtha distillate.

The fourth item is gasoline in pipe lines and the operating equipment of the refinery, the pipes running through the refinery and the various processing equipment.

Another item is the gasoline contained in pipe lines running throughout the country. The amount in transit
2795 during that operation is also unavailable. Large numbers of tankers ply between Gulf ports and to the East coast, and otherwise, which require gasoline during half of their journey. There must be provision made for that and the return of the tanker. The same holds for tank cars and barges.

Terminals must be protected against the next arrival of a tanker, a group of tankers, or a barge. Icebound terminals must be provided for, particularly later in the summer before such date as waterways freeze over and they are not permitted further transportation by water to those locations, in order that they may supply surrounding territories with gasoline during the winter season when the terminals themselves are ice-bound.

There are a number of items, but these are 90 to 95% of them.

Unavailable stocks must be maintained in order to keep the system operating.

Studies have been made as to the amount of the unavailable supply of gasoline. The National Gasoline Inventories Committee of the Planning and Coordination Committee made such studies covering the large part of 1935, and they found that for the period from March, 1935, through September of that year, the industry needed a minimum of 37,000,000 barrels of gasoline monthly as unavailable.

2796 Stocks available for shipment means the amount of gasoline represented by the difference between the total amount of gasoline in storage and the unavailable gasoline which cannot be shipped. That is the stock that can be shipped if the industry is to remain operating.

The unavailable storage stocks in a sense remain stationary the year around. For instance, in the way I think of it, and I think all of us do, the refining year runs from September 30 to September 30, and we must have in storage at all times as unavailable during this period of time a certain amount of gasoline to operate our equipment. As we come to the end of any given refining year, we look back and see where we added another tank, added another unit to our refinery, added another tanker or barge; and whether or not we did operate conveniently and economically. As we look back there we might see that next year our unavailable stocks should be increased because of one or two of these additions, and it is a fact that during this period such increased amounts were allowed.

The industry finds it is necessary to build up its seasonal stocks of gasoline during the low consuming season or during the months of October, November, December, January, February, and March, in order that they may have sufficient gasoline on hand to supply the following season's 2797 high demand. That is because the industry as a whole cannot currently produce the large demand of a summer seasonal period.

Inventories always reach their high level for the country as a whole and in many districts on March 31 of any year, and their low level on September 30.

The source of my statistical data concerning finished and unfinished gasoline inventories is the American Petroleum Institute Annual Statistical Bulletin No. 16 of March 27, 1937. Those figures were based on information contained in the monthly and annual statistical statements of the United States Bureau of Mines. That tabulation to which I have referred accurately reports the data contained in the source material. I have those bulletins and statements here with me.

(Tabulation referred to is received in evidence as EXHIBIT 949.)

At the end of January, 1935 there were about 59,000,000 barrels of finished and unfinished gasoline in storage. During February and March these inventories increased seasonally, until, at the end of the latter months, there were 66,290,000 barrels in storage.

From then on, through September, 1935, we find seasonal withdrawals amounting to various amounts, but showing about 3,000,000 barrels withdrawn in July, and almost

5,000,000 barrels withdrawn in August. Seasonal 2798 stocks at the end of March were 66,000,000 barrels, approximately, and at the end of September, approximately 51,000,000 barrels.

The trend, instead of changing there, as is usual, and going on up through October, November and December, showed the reverse, in that October, 1935 continued on down below September, registering a low for the year of 49,800,000 barrels, approximately.

As we would expect, from October, 1935 through to the end of the year, stocks increased seasonally, which trend continued during January, February and March, 1936.

Again, in 1936 we start a downward trend beginning in March and running through October, a second year in succession in which in October the trend of inventories went against the usual seasonal trend.

At the end of March, 1936, we find 74,485,000 barrels in storage, and at the end of October 57,662,000 barrels, individual months showing withdrawals as much as 4,000,000 and 5,000,000 barrels.

At the end of December, 1936 stocks had increased seasonally again through November and December, until on December 31, 1936, we had 62,885,000 barrels of finished and unfinished gasoline in storage.

By minimum gasoline inventory requirements, I mean the minimum amount of gasoline that the industry 2799 should have on hand at the beginning of a high consuming season. In other words, they should have all of their fixed unavailables, plus a certain seasonal amount which would be helpful and which they absolutely need during the following high consuming season. I have made a study of such minimum requirements. I did that as a member of the National Gasoline Inventory Committee in Washington, in the early part of 1935.

In January, 1935 we find no more than minimum gasoline inventory requirements. In February, 1935, we find a seasonal build-up in accordance with the studies made by the National Gasoline Inventory Committee of the Planning and Coordination Committee.

In March, 1935, we find inventories of 66,290,000 barrels, as compared with 66,130,000 barrels, which the National Gasoline Inventory Committee, after exhaustive studies by companies and by districts, determined to be the minimum requirements.

At the end of April, 1935, we find gasoline inventories going down seasonally in accordance, again, with minimums; and that same trend existed through September, at which date we arrived, September 30th, with very slightly more than these minimum requirements, practically nothing more.

In October, 1935, the trend of gasoline inventories continued downward, which indicated an amount lower 2800 than minimum requirements as of that date, plus seasonals. In November and December, 1935, and January and February, 1936 the stocks increased seasonally, but during February stocks went up slightly above minimum requirements, due to disappointing demand and other causes.

Stocks increased during March, 1936, and were slightly above minimum requirements at the end of the month.

During April, 1936, the trend started downward, and continued through May, June and July, indicating a draft of 5,000,000 barrels in July. It went on down through August and September, arriving at September 30th with somewhat more than minimum seasonal requirements. The trend went down again in October, however, against the usual seasonal trend, and up in November and December.

For the year 1935, month by month, the gasoline inventory position was in complete balance during the entire year. In fact, I would say that in October, stocks were below seasonal and unavailable requirements. The situation was very strong.

In 1936, at the beginning of the year stocks were at the minimum required levels; during the early spring, they rose slightly above those minimums, which excess continued toward the end of the high consuming season, and was at its peak in September, and dropped off slightly toward the end of the year.

We have a method in the industry for the calcula- 2801 tion of inventories in terms of demand. It is expressed in terms of days' supply, which means the number of days that the industry could supply motor fuel to the motorists of the country, first, if they stopped refining operations completely; and, second, if they continued to operate and had to retain in the system the unavailable amounts required for economic operation.

I have prepared a tabulation of gasoline inventories by months for the years 1935 and 1936, in terms of days' supply. In preparing that tabulation, I used the finished gasoline inventory only, because the unfinished is not available for the motorist, having to undergo considerable further processing.

I obtained the statistical data as to the amount of finished gasoline in storage from the American Petroleum Institute's Annual Statistical Bulletin No. 16 of March 27, 1937. Then I also took the demand for gasoline from the United States Bureau of Mines monthly petroleum statements. And I took those two amounts, the demand in the form of daily average and the actual inventories of finished gasoline at the end of each month, and found how many days that amount of finished gasoline would supply the motorist with his gasoline. I have those source bulletins and statements with me. I have accurately recorded the data that I compiled in this tabulation.

(Tabulation referred to received in evidence as EXHIBIT 950.)

2802 Exhibit 950 shows that at the end of January, 1935, there were 50.6 days' supply of finished gasoline in storage. The trend is then downward through February, March, April, May, June, July, August and September, coming down rapidly, reducing as many as 4 days at a time, until at the end of September we find 32.2 days of gasoline supply in the form of finished motor fuel. That is the lowest point of days' supply during this entire 2 year period.

In October, 1935, the trend starts upward again seasonally, and continues through November and December and goes on up to a high point in January, 1936, which shows 51 days of gasoline in storage as compared with 50.6 days in storage at the end of January, 1935.

In February, 1936, the trend starts downward again, March, April, May, June, July and August indicating decreases in some months of approximately 4 days until August had 34.1 days.

At the end of September, 1936, which month usually shows a little less than August, we find a change upward to 34.3 days, and the trend upward continues through October, November and December. At the end of December of 1936, however, we find approximately the same number of days' supply available as were in storage at the end of December, 1935, or approximately 46.8 days.

As of January, 1935, there were 50.6 days' supply.

2803 That means that there was enough in storage at that time to run the automobiles for 50.6 days if the industry discontinued to operate and would ship out to the market all the finished gasoline it had in storage in its plants at that time.

September, 1935, had come down 18.4 days' supply to the lowest point during that entire 2 year period.

The balance of supply and demand in the petroleum industry involves both raw materials and refined products.

If those were out of balance the industry from a statistical position would be unsound.

I have given the figures in relation to gasoline production and demand and stocks on hand during the years 1935 and 1936. I have similar statistics in relation to crude oil.

In the first 4 months of 1935, the Petroleum Administrative Board, and afterward the Bureau of Mines, forecasted the probable amount of gasoline production necessary to meet demand. The same thing was done by those bodies in relation to the production of crude oil each month. These recommendations of production were published for the period from January through June, 1935, by the Petroleum Administrative Board of the Department of the Interior. They were published in the form of recommended crude oil production allowables. For the period from July, 1935, and extending through December, 1936, the Department of
2804 the Interior issued monthly figures recommending certain allowables of crude oil production by states and for the total United States.

I have prepared accurately from the bulletins and statements to which I have referred, a tabulation comparing by months for 1935 and 1936 the recommended production with actual production. I have those documents and bulletins with me.

(Document referred to is received in evidence as EXHIBIT 951.)

The figures in comparison show that the Bureau of Mines' recommended crude oil production was exceeded actually in every month during 1935. They were exceeded to amounts as high as 10,000,000 barrels, which occurred in November, 1935. Lesser amounts were 9,000,000 barrels, 6,000,000 barrels and 3,000,000 barrels.

During 1935 there were 997,000,000 barrels, approximately, actually produced after a recommendation of the Bureau of Mines that the country as a whole produce 938,000,000. In other words, there were approximately 60,000,000 barrels more crude oil produced than the Bureau recommended during 1935.

In 1936 again we find the industry producing crude oil in excess of the Bureau's recommendations during every month.

For 1936 the industry actually produced 1,099,000,000 barrels, compared with 1,030,000,000 barrels recom-
2805 mended by the Bureau, or an actual production of almost 69,000,000 barrels above the Bureau's recommendation.

I have prepared a tabulation showing the crude oil inventories in the United States at the end of each month in 1935 and 1936. I have prepared a tabulation which shows the increase and decrease of crude oil inventories in the United States during each month of those 2 years. I have put those on the same sheet of paper.

I took the inventory figures from the American Petroleum Institute's bulletins, previously referred to, which are a tabulation of the crude oil inventory figures contained in the United States Bureau of Mines monthly petroleum statements. That statement correctly records the information that I obtained.

(Document referred to received in evidence as EXHIBIT 952.)

At the end of January, 1935, we had 338,000,000 barrels of crude oil in storage. During the year 1935 there were 22,000,000 barrels of crude oil withdrawn from storage, with individual monthly figures showing as high as 5,000,000 barrels.

During the year 1936 there were approximately 27,000,000 barrels of crude oil withdrawn from storage, showing September withdrawing 6,000,000.

2806 I account for the decrease in crude oil stocks in this two-year period, in the face of the large production of crude oil just previously mentioned and above the recommendations of the Bureau of Mines, by showing that the demand for gasoline and other products during both of those years was so great as not only to absorb the overproduction of crude oil in relation to the Bureau of Mines' recommendations, but also to have necessitated these large withdrawals of crude oil from storage, to the extent of approximately 50,000,000 barrels during the two-year period.

The crude inventories in January, 1935, were at the lowest point they had been for some time.

It would be fair to say that the unexpected increase in the demand for gasoline in the years 1935 and 1936 accounts for the reduction in crude oil stocks during that period.

Q. Now, I want to direct your attention to Exhibit 869, and have you look at the trend of gasoline prices as indicated on that Exhibit, and ask you to state whether or not, in your opinion, based upon the studies that you have described you made, that trend is the result of the forces which you have just described to us?

Mr. Chaffetz: That is objected to, your Honor. It 2807 is not only leading, but it is a question that the jury has to determine and decide in this case. This witness hasn't testified at all about the buying programs and what effect they might have on prices. Apparently he is going to exclude them entirely, and deal with other factors; and I think it is irrelevant, immaterial and incompetent.

The Court: I am going to sustain that objection; but I think the witness ought to be permitted to tell us in what manner, and to what extent, and how the factors he has referred to in these statistics influenced that trend.

Mr. Donovan: Then, your Honor, in view of that, could we, since I know the time is getting short and we want to get into that, I will follow your Honor's suggestion—I would like to have that followed at a later time. Can we do that? We will leave that question as it stands. I understand that the objection is sustained.

The Court: Yes. Exception allowed.

Referring to Exhibit 869 and the price rise which apparently started in March, 1935, it is my opinion, based on the statistical position of the industry that I have related and my interpretation of that position, that the price rise did not start in March, but that it started back in October, 1934.

Mr. Donovan: Q. Now, in view of that opinion 2808 do you consider it necessary to describe to this Court and to this jury the statistical condition of the industry during the months of October, November and December of 1934 in order to interpret just what is set forth?

Mr. Chaffetz: If your Honor please, I regret to have to say this—that it is in my opinion an attempt, in a different way, to introduce the same evidence that has been offered here at least on a dozen previous occasions and was ruled out; and the way in which it is now offered is not in any substantial way different from the way it was offered before. We then pointed out to your Honor that if we were going into a discussion of the factors that made the price in 1934, we were going to have several other cases, and a lot of other factors to deal with, and we have urged your Honor not to require us now to go into a discussion of the factors that entered into the price in 1934. There were different factors.

The Court: I understand when the price started rising was in October, 1934?

A. Yes, sir.

The Court: He can answer the question by telling what the price of gasoline was at that time in November and December without going into the factors—

2809 Mr. Chaffetz: Then we are going into other factors, your Honor, that enter into the price at that time, factors that we have been urgently requesting your Honor to exclude, and we argued at very great length while the jury were excluded, and you remember certain graphs they wanted to offer. They tried once and they tried again, and each time they were excluded, and this is a flimsy excuse that this witness gives that you have to consider when your Honor has—

The Court: I think we excluded that at that time, what the factors were in 1935 and 1936 that did not exist at that time.

Mr. Donovan: Now, your Honor, I hope that Mr. Chaffetz will withdraw that remark about a flimsy excuse because it isn't a flimsy excuse. It is a very substantial reason. Certainly Mr. Chaffetz would be the last, if it be the fact, to have excluded from this jury, if it be the fact, that there was a price rise, and this was part of that price rise prior to March 1, 1935.

Mr. Chaffetz: And that is going to lead us into a subject which your Honor has said we should not be concerned with here. This question will lead to other questions, and then we are going to get into—

The Court: Objection sustained. Exception allowed.

Mr. Donovan: The witness is not permitted to go 2810 back and show the factors that were in operation in 1934?

The Court: No.

Mr. Donovan: Your Honor, I have already stated the purpose of that and may I now make an offer on relation to that?

The Court; Yes, you may.

(The following proceedings were had in the absence of the jury.)

Offer of proof re factors affecting price trend in October, November and December, 1934.

Mr. Donovan: The following question was submitted to the witness, Fred Van Covern:

Q. Now, in view of that opinion, do you consider it necessary to describe to this Court and to this jury the statistical condition of the industry during the months of October, November, and December of 1934 in order to interpret just what is set forth?

The Government objected on the ground that such evidence was irrelevant and immaterial. The objection was sustained.

The indictment, paragraph 18, alleges that the defendants "combined and conspired together for the purpose of artificially raising and fixing the tank 2811 car prices of gasoline in the aforementioned spot market, and, as intended by them, defendants have artificially raised and fixed said spot market tank car prices of gasoline * * *."

The Government claims that the rise in the spot market prices began around the first of March, 1935. There was, in fact, an advance in the tank car market during the period March 1 to in June, 1935, and that advance was uninterrupted by any temporary decline. The Government infers that March 1, 1935, was the date on which the advance began, and that this advance had no connection with any larger trend, and was due primarily to the alleged conspiracy. The witness, Fred Van Covern, has testified that, in his opinion, the advance began in October, 1934.

The witness, Van Covern, would testify that the price of gasoline on the spot market, as reflected by the quotations in the Chicago Journal of Commerce and Platt's Oilgram, Group 3, on third grade gasoline reached a low of 2½¢ in October, 1934. He would also say that regular grade gasoline was at a correspondingly low point at the same time, and spot market tank car gasoline prices began to rise around October 25th. The trend from that time until June, 1935, was upward, and the same factors affected this whole trend. This was not an uninterrupted ad- 2812 vance. There were two price drops. The two price drops in this period did not by any means push the price of gasoline back to the lows reached in October, 1934. The trend was always upward.

The witness, Fred Van Covern, would testify that from his study of the factors affecting price, it is clearly indicated that beginning about October 25, 1934, and continuing throughout 1934 the balance of supply and demand was such that, except for the influence of the threat of a flood of hot oil, the price of gasoline would have inevitably risen to approximate parity with dollar crude prior to the passage of the Connally Act. We are entitled to show that this would have happened, except for the threat of a flood of hot oil, and to show further that when this factor was removed the price of gasoline did reach an approximate parity.

If the witness, Fred Van Covern, is not permitted to explain the factors affecting the price trends during October, November, and December, 1934, he will be able to tell only half a story. Comparison should be made, one month with another, and one event with another. For example, the Government has admitted that the Federal Tender Board established on March 1, 1935, influenced prices. One of the questions of fact to be settled in this case is the degree to which this Federal Tender Board influ-
2813 enced prices. The Government apparently contends that even though the Federal Tender Board had some influence, prices would not have advanced 1½¢ without the alleged buying programs. The witness, Fred Van Covern, would testify that there was a prior Federal Tender Board which operated in October, November, and December, 1934, during the beginning of this price rise, and he should be permitted to testify as to the effect of the first Federal Tender Board on prices.

The defendants are charged with raising prices. They should be permitted to show the whole price rise and explain the factors causing it. By excluding October, November, and December, 1934, one-third of the rise on third grade gasoline, for example, is left unexplained. The total rise from around October 25, 1934 to June 1, 1935, was 2½¢; from March 1, 1935, to June 1, 1935, the rise was 1½¢.

This testimony of the witness, Fred Van Covern, concerning the factors affecting price in October, November and December, 1934, would conclusively rebut the inference which the Government seeks to make from the mere fact that the price of gasoline went up after the passage of the Connally Act.

If Fred Van Covern were permitted to answer the first question below and other questions which would have followed this one concerning the tank car price 2814 of gasoline and the factors affecting such during the months of October, November, and December, 1934, he would testify as follows:

Q. Now, in view of that opinion, did you consider it necessary to describe to this court and to this jury the statistical condition of the industry during the months of October, November, and December of 1934 in connection with the tank car market trend of prices on Chart 849?

A. Yes, because without an understanding of the developments which occurred during the last quarter of 1934, since the prices during that period are part of a rising trend, it is my opinion that it would be hard, if not impossible to make a complete explanation of the trend of tank car prices in 1935 and 1936.

Q. What was the statistical position of the industry on October 1, 1934?

A. Gasoline inventories in the United States as a whole were very low, were below minimum requirements. Inventories of gasoline in terms of days' supply were also at a very low level. Gasoline demand in the country as a whole was increasing over the demand for the previous year. The estimate for the month of October proved to be far short of the actual demand for gasoline. Crude oil inventories were at about a proper level. There was in 2815 fact only one factor which influenced the price of gasoline adversely—this was the lack of control of the production of hot oil. The production of such hot oil had increased and it looked as though the production in October would be very great. The effect of this one adverse factor was so great that it was forcing the price of gasoline downward.

Q. Have you prepared statistical data relating to gasoline demand, both domestic and export, for the months of October, November and December, 1934?

A. Yes.

Q. Will you please state the source of such data?

A. The figures have been taken from the American Petroleum Institute's Annual Statistical Bulletin No. 26 of May 22, 1936. The basic information used therein is from the Bureau of Mines' monthly petroleum statement.

Q. Will you please state the domestic demand, the export demand, the total demand for each of those three months; also will you please indicate the percentage of increase or decrease of such total demand over the same month of 1933?

A. These figures are as follows:

2816

1934	Domestic Demand (Barrels)	Exports (Barrels)	Total Demand (Barrels)	Total Demand Increase or Decrease Over Same Month Previous Year (Percent)
Oct.	37,834,000	1,965,000	39,709,000	10.37
Nov.	35,065,000	2,210,000	37,275,000	11.58
Dec.	30,724,000	1,635,000	32,359,000	5.91

Q. Have you prepared data concerning the forecast of United States domestic plus export demand compared with the actual demand for the months of October, November, and December, 1934?

A. Yes.

Q. Will you please state the source of this data?

A. The forecasts are those of the Petroleum Administrative Board. The figures concerning actual demand were taken from the American Petroleum Institute's Annual Statistical Bulletin No. 26 of May 22, 1936.

Q. Will you please state the forecast of demand, and actual demand, and the amount by which the actual demand was over or under the forecast for these three months?

A. These figures are as follows:

2817

1934	Forecast (Barrels)	Actual (Barrels)	Actual Over Forecast (Barrels)
October	35,640,000	39,799,000	4,159,000
November	33,580,000	37,275,000	3,695,000
December	31,320,000	32,359,000	1,129,000

Q. Have you prepared data showing the inventories of gasoline in the United States for the months of October, November, and December, 1934?

A. Yes.

Q. What is the source of this data?

A. The figures are taken from the American Petroleum Institute's Annual Statistical Bulletin No. 26 of May 22, 1936. The figures in that bulletin were calculated from basic information obtained from the Bureau of Mines' petroleum statements.

Q. Will you please state the amount of finished gasoline, unfinished gasoline, and the total of finished and unfinished gasoline in storage in each of these three months?

A. These figures are as follows:

1934	Finished Gasoline (Barrels)	Unfinished Gasoline (Barrels)	Total (Barrels)
October	45,212,000	4,888,000	50,100,000
November	43,958,000	4,957,000	48,915,000
December	48,205,000	5,014,000	53,219,000

2818 Q. Were these inventories at a high or low level?

A. These inventories were at extremely low levels.

Q. Were they below minimum inventory requirements?

A. Yes.

Q. Had the industry made the usual seasonal build-up during these three months?

A. No. In November the inventories were at the lowest point for the entire year. As I have stated before, September is the month in which inventories are customarily at the lowest level.

Q. What caused the inventories to be at this low level during these three months?

A. The refinery control system under the revised Article IV of the Petroleum Code had operated to force refiners, primarily major companies, to reduce inventories. In addition the demand for gasoline during those three months, as I have already shown, was greater than had been anticipated.

Q. In October, will you state whether or not the Administrator took cognizance of the fact that gasoline inventories were at a dangerously low level?

A. He did.

2819 Q. What did the Administrator do?

A. On October 18, 1934, Administrator Ickes ordered that if, after all possible adjustments within the limits of the November allocation order indicated that gasoline inventories had reached a dangerously low level, and if, as a result of appeals to the Board of Review it was indicated that inventories had fallen below levels which would permit even and economical operations, the company so affected, upon the recommendation of the P. & C. Committee, after approval by the Administrator, would be permitted to manufacture such additional amounts of gasoline as might be necessary to adjust the gasoline inventory situation.

Q. Have you prepared data concerning days' supply of finished gasoline on hand, or in inventories in the United States for October, November, and December, 1934?

A. Yes.

Q. What is the source of such data?

A. The information concerning gasoline demand and finished gasoline inventories at the end of each of these 3 months was obtained from the American Petroleum Institute's Annual Statistical Bulletin No. 26 of May 22, 1936. The days' supply calculation was made by me.

2820 Q. Will you please state the gasoline demand, domestic plus export, for each of these months and the daily average of such demand for each of these months as well as the finished gasoline inventory at the end of each of these months, and gasoline on hand in terms of days' supply at the end of each of these months?

A. These figures are as follows:

	Gasoline Demand			
	Domestic & Export			
1934	Monthly Total (Barrels)	Average Per Day (Barrels)	Finished Gasoline Inventory End of Month (Barrels)	Days Supply (Days)
October	39,799,000	1,283,800	45,212,000	37.6
November	37,275,000	1,242,500	43,958,000	42.9
December	32,359,000	1,043,800	48,205,000	49.0

Q. Have you prepared data concerning recommended crude oil production compared with actual crude oil production in the United States for October, November and December, 1934?

A. Yes.

Q. Will you please state the source of this data?

A. The recommended production levels are those of the Department of the Interior. The actual production figures have been taken from the American Petroleum Institute's Annual Statistical Bulletin No.

26, May 22, 1936. The figures contained in the statistical 2821 bulletin were taken from the monthly petroleum statements published by the United States Bureau of Mines.

Q. Will you please state the recommended production per day and per month in the United States for each of these months, as well as the actual production for each of these months?

A. These figures are as follows:

	Recommended Production		Actual Production
Year 1934	Per Day (Barrels)	Computed Per Month (Barrels)	Per Month (Barrels)
October	2,325,800	72,099,800	76,593,000
November	2,340,300	70,209,000	72,399,000
Dec. 1 to 16	2,307,000	36,912,000	
Dec. 17 to 31	2,460,300	36,904,500	
Total Dec.	2,381,177	73,816,500	72,797,000

Q. Will you please state, if you know, why the recommended production for December was broken up into two periods, the first period covering the 1st to the 16th, and the second from the 17th to the 31st?

A. The production level recommended for the period from December 1 to 16 was made in the latter part of November, but in recognition of the condition of gasoline inventories which was discovered as a result of the allocators' meeting and a special session 2822 of the Board of Review, called under the authority of the Administrator's Order of October 18, 1934, and also in recognition of the increased gasoline demand, the Administrator increased his recommendation of crude oil production on December 17 for the period from that date to the end of the month.

Q. Have you prepared data concerning crude inventories in the United States for the months of October, November and December, 1934?

A. Yes.

Q. What was the source of this data?

A. The source of this data is the American Petroleum Institute's Annual Statistical Bulletin No. 26 of May 22, 1936. The basic information in that bulletin is contained in the monthly petroleum statements published by the United States Bureau of Mines.

Q. Will you please state the inventory of crude oil at the end of each of these three months and the increase or decrease in such inventory during each of these three months?

A. These figures are as follows:

2823

1934	Inventory End of Month (Barrels)	Increase Decrease — During Month—Barrels
October	346,800,000	2,607,000 —
November	341,403,000	5,397,000 —
December	337,254,000	4,149,000 —
Total Year ..		16,969,000 —

Q. Can you state the quotations as published in the Oilgram and Chicago Journal of Commerce for third grade and regular grade gasoline for the month of October, 1934?

A. Yes.

Q. Will you please do so?

A. Those are as follows:

2824

	Third Grade		Regular	
1934	Oilgram Okla. Market 62 Oct. & Below	Chi. Jour. of Commerce 62 Oct. & Below	Oilgram Okla. Market 63-70	Chicago Jour. of Commerce 63-70
Oct. 1	3⅝ to 3¾	3⅝ to 3¾	4⅝ to 5	4⅝ to 4¾
2	3½ to 3⅝	do	4½ to 4⅝	do
3	do	3¼ to 3⅝	do	4½ to 4⅝
4	do	3⅛ to 3½	do	4⅜ to 4⅝
5	3⅜ to 3⅝	do	4⅜ to 4⅝	do
6	do	3 to 3½	do	4⅜ to 4¾
7	....	....	....	....
8	3¼ to 3½	2⅞ to 3⅜	4⅜ to 4⅞	4¼ to 4¾
9	do	2¾ to 3¼	do	4¼ to 4⅝
10	3 to 3¼	2¾ to 3	4⅛ to 4¾	4⅛ to 4½
11	do	2⅝ to 3	do	4 to 4½
12	2⅞ to 3¼	2½ to 3	4⅛ to 4⅝	4 to 4⅜
13	do	do	do	do
14	....	....	....	....
15	do	do	do	do
16	do	do	do	do

27	do	3 to 3⅛	do	4 to 4½
28	....	....	....	....
29	do	3⅛ to 3¼	do	do
30	3⅛ to 3⅜	3¼ to 3⅜	4⅜ to 4⅝	4⅛ to 4½
31	3⅛ to 3⅜	3⅜ to 3½	do	4¼ to 4⅝

Q. During the period, October 1 to October 12, 1934, what happened to the trend of the tank car price of gasoline as reflected by the quotations published in Platt's Oilgram and the Chicago Journal of Commerce?

A. The price declined during that period.

Q. Will you please state why, in your opinion, those prices declined?

2825 A. The primary reason for the decline in this price trend was the overproduction of crude oil in East Texas. In that month this overproduction reached the highest point in sixteen months. The production of hot crude made possible the potential manufacture of cheap gasoline which would inevitably compete with gasoline manufactured from legal crude.

Q. Did the level of total inventories in the United States, the level of the days' supply of gasoline on hand, and the actual demand for gasoline, have any effect on price?

A. Those factors always have an influence on price.

Q. During this period what was the influence of these factors on price?

A. They should have influenced the price upward since the demand for gasoline was greater than had been estimated, gasoline inventories were dangerously low, and the days' supply of gasoline was low; but the effect of the actual overproduction and the threat of additional production of illegal crude oil in East Texas outweighed these influences and the price declined.

Q. What happened to the trend of tank car prices in the last part of October and the first part of November, 1934?

A. The prices rose sharply.

2826 Q. What was the actual rise in the price of third grade gasoline during this period, as reflected by the quotations in the Oilgram and the Chicago Journal of Commerce?

A. The low quotations of these journals raised 1½¢.

Q. What was the amount of the rise in the prices of the same grade of gasoline in these journals during the period from March 1 to June 1, 1935?

A. The low quotations advanced 1½¢.

Q. Will you please state why, in your opinion, the trend of prices rose during the latter part of October and the first part of November, 1934?

A. As was just pointed out, there was only one really unfavorable factor influencing prices during the first part of October. This was the overproduction of crude oil in East Texas. The situation in that field was immediately improved with the creation and subsequent operation of the Federal Tender Board. It held its first hearing on October 25, 1934. Many of the refineries previously operating on hot oil closed down, and the number of tank cars of hot gasoline in interstate commerce was reduced to almost nothing. The trend of gasoline prices reversed its trend and advanced sharply.

2827 Q. What happened to the trend of tank car gasoline prices during the latter part of November and early part of December, 1934?

A. The prices remained substantially on a level.

Q. What, in your opinion, caused this levelling off?

A. Gasoline demand was considerably higher than forecast, inventories of gasoline continued downward, the overproduction of gasoline in East Texas was reduced to a small amount, crude oil inventories throughout the country declined substantially. These factors would have tended to push the price up further. The upward trend did not continue because the Federal Tender Board could not exclude hot gasoline from interstate commerce and was under attack in the courts, and there was a fear that the tremendous potentialities of the East Texas field might again be turned loose as a result of the possible success of hot oil operators in overcoming the authority of the Federal Tender Board.

Q. What was the trend of tank car prices in the rest of December, 1934?

A. The price declined, then recovered a part of the decline, and then levelled off.

Q. Will you please state why, in your opinion, the price acted thus?

2828 A. In my opinion the drop in price was the result of the continued uncertainty in East Texas concerning the operation of the Federal Tender Board. Further, the Tender Board could not be entirely effective as long as the interstate shipment of the products of petroleum was not prevented. Some time after the Tender Board was set up hot oil refiners learned that they could ship illegal gasoline from one point to another within the State of Texas and then divert it into interstate commerce. The Federal Tender Board was unable to prevent such diversion. The movement of illegal gasoline in Texas also displaced some legal gasoline within the state which consequently had to be dumped into interstate commerce at low prices. The partial recovery subsequently was due to the fact that the State of Texas adopted regulations which required tenders for the shipment of petroleum products in intrastate commerce which effectively prevented the movement of illegal gasoline within Texas. In addition, the overproduction of crude oil in East Texas was further decreased. Crude oil inventories also declined during that month and gasoline demand continued above the estimates of the Bureau of Mines.

Q. In addition to these factors which you have mentioned, with particular reference to individual parts of the three month period—October, November, and December, 1934—were there any other factors affecting the price of gasoline during that period? 2829

A. Yes.

Q. What were they?

A. During this period the price of crude oil remained at $1.00. The price of gasoline is, of course, affected by the price of the raw material.

Another factor affecting the price of the gasoline was that there were 84 refineries, many of them using hot oil, which existed on October 1, 1934. As the Federal Tender Board began to operate effectively the number of such refineries was substantially reduced.

Q. Can you compare the number of refineries in operation in East Texas on October 1, 1934, and during the first part of March, 1935?

A. Yes.

Q. Will you please do so?

A. I have already stated that there were 84 refineries in operation on October 1, 1934, and this compared with a figure of 14 refineries operating after the second Federal Tender Board started functioning. This decrease was due to the fact that most of those who shut down could not operate on legal crude, which cost $1.00 a barrel.

2830 Q. Will you please summarize the factors affecting prices for the period October, November, and December, 1934?

A. Gasoline demand increased substantially in each of the months—October, November, and December—over the consumptive levels of the comparable months of the previous year, and the consumption for the period was 9,000,000 barrels in excess of the Petroleum Administrative Board's forecast.

Gasoline inventories in the United States approached dangerously low levels in November and were built up to a point near minimum requirements by the end of December, 1934. During the period there was a draft on crude oil stocks of approximately 12,000,000 barrels; the overproduction of crude oil in East Texas dropped sharply. These factors all tended to cause an increase in the price. There was only one loose end, only one factor tending to keep the price down. That was the threat of having the East Texas field opened wide again. The situation in East Texas was uncertain because there was litigation attacking the validity of the National Industrial Recovery Act.

Q. Had there been no uncertainty concerning the authority for the Federal Tender Board, created under Section 9(C) of the National Industrial Recovery Act, what, in your opinion, would have been the trend of gasoline prices? 2831

A. I believe that there would have been a sustained increase in the price of gasoline to a level bringing it into an approximate parity with the price of crude oil. It is my opinion that the price of gasoline would have risen to higher levels and would have continued to rise until it reached this approximate parity.

Q. In making this assumption, when do you think this parity would have been reached?

A. I feel that this approximate parity would have been reached much sooner than June, 1935, had the Federal Tender Board remained in operation, and had its authority been definitely determined.

Q. How did the situation in connection with gasoline demand, estimated demand, gasoline inventories, crude oil inventories, and crude oil production for the period October, November, and December, 1934, compare with the period March, April and May, 1935?

A. During both periods these factors were in ap-

proximate balance. There was not a surplus of gasoline during either period and gasoline demand was far ahead of comparable months in the previous year
2832 and was greater than had been estimated. Crude inventories declined during both periods.

Q. You have stated that the threat of a flood of hot oil was a depressing influence on gasoline prices in October, November, and December, 1934. Was there a similar influence during March, April and May, 1935?

A. No.

Q. Under those circumstances and with the supply and demand of gasoline and crude oil in approximate balance, what would you expect would happen concerning gasoline prices?

A. In my opinion, they would reach an approximate parity with the price of crude.

Q. Did that occur?

A. Yes.

Mr. Chaffetz: Objection to the offer of proof.

The Court: Objection sustained. Exception allowed.

(The following proceedings were had in the presence of the jury.)

By Mr. Donovan

I have had prepared under my supervision certain charts which set forth statistically and graphically the conditions for the period from January 1, 1935 to December, 1936. I have those charts with me. They are here.

2833 Mr. Donovan: I ask to have these marked for identification.

(Charts referred to are received in evidence as EXHIBITS 953, 954, respectively.)

Exhibits 953 and 954 accurately record what I have already testified to in relation to the matters referred to on the charts. The charts accurately represent just what is represented on these charts.

These charts are all based upon United States Bureau of Mines statistics as concerns gasoline, on this side (indicating) and crude oil on this side (indicating).

On this chart (indicating) we find graphically illustrated the trend of total demand within the United States. This is demand for gasoline, both domestic and amounts shipped to export trade. We have traced in the orange block the domestic sale of gasoline, with the green at the top of each column showing the export shipments.

Immediately above the top of the column is shown the total amount of gasoline shipped, while the figure in the green block indicates the export shipments, with the amounts indicated in the orange section, the domestic demand for gasoline.

Immediately above the figure indicating the total amount of gasoline shipped there is shown the percentage change in each month when compared with the corresponding month of the previous year. That is the percentage of
increase or decrease in any given month when com-
2834 pared with the corresponding month of the previous
year.

It shows for 1935 the demand for the year, demand for gasoline increased 7%, while in 1936 the total demand for gasoline increased about 9½%. For the month of January, 1935 it shows a decline of 4.8% when compared with the corresponding period of the previous year, due no doubt to the extreme weather of that month. The rest of 1935 is all above, showing a small increase in February and larger increases as we go into the year. The same is true for 1936. January started out with a high rate of increase. February fell down again also due to the extreme weather of that month, and then the increase started up again, showing as high as 14% for the month of September, 1936 as compared with September, 1935.

It is basically correct that the 14% increase in September, 1936 is in addition to the 10% increase in 1935 over 1934, so that there was a total increase of 24% in 1936 over 1934; only this 14 is 14% increase over this (indicating on chart) which is 12% increase approximately with 1934, but when you compare September, 1934, in connection with September, 1936, you cannot add those two up. That would understate the increase.

In this section here (indicating) we have gasoline demand again shown by months in green. The green column
over each month of the 2 year period shows the
2835 actual demand for gasoline. The red line drawn
across each green column shows the amount of gasoline that the Bureau of Mines forecast or estimated, in other words, the amount they thought would be sold during each of those months.

The Bureau underestimated demand slightly in January, 1935; they overestimated demand slightly in February. From March through August we find that they continuously under-estimated demand, as high as 4,000,000 barrels in a given month, July, 1935. In September, 1935 they slightly over-estimated demand, while in August they under-estimated demand considerably, almost 4,500,000 barrels.

We then come over into 1936, and find that February was also over-estimated. That again was the very extreme weather in that year. Temperatures all over the country at that time were very low, and weather conditions were extremely bad, and road conditions bad. In March and April the demand was also over-estimated.

This section shows gasoline inventories at the end of each month. This is a total of finished and unfinished gasoline as reported by the Bureau of Mines. We find that in January, February and March stocks increased and then there was a seasonal decline all the way through October. We know that usually in October the trend
2836 of seasonal stocks starts upward through March of
the following year, but in this particular October we find stocks going on down below seasonal levels.

The trend started up in November again, through December and on up to March, 1936 (indicating); and then it started down, but rather slowly and hesitantly, up in this area here, through March, April and May, 1936 (indicating).

Then it comes on down again (indicating), showing heavy withdrawals in June, and continuing in July and August, 1936, with a very slight decline in September, and then October was very, very slightly less than September again; and then we find the usual seasonal increase, running on towards the next high consuming season (indicating).

The red line (indicating) indicates the amount of unavailable stocks of gasoline that the industry must have on hand at all times in order to operate conveniently. You will remember that that is the amount we said that they could not ship if they were to remain operating. Therefore, this amount above the red line, to the top of the column (indicating), is available for shipment.

You will see that the largest amount of seasonal inventories is in storage at the end of March, and that the amount that can be shipped to the motorist, after deducting the unavailables, continues down to its lowest
2837 point, usually about September, or, in this particular
year, it happened to be October, the trend of inventories being against the usual seasonal upturn in that month.

In October, 1935 (indicating), we give credit for the additional amount of gasoline that the industry must have on hand to meet the higher demand, and to supply increased facilities, new pipe lines, new barges, new terminals, new tanks and other items that require additional gasoline before they can be operated. I am talking now about unavailables. Again in October, 1936, we show an increased amount due to the increased facilities required (indicating). That also is unavailable. Anything below this red dotted line (indicating), through this 2 year period is unavailable for shipment if the industry is to continue to operate; anything above the red line is available for shipment to the motorist.

Down below the inventory chart (indicating), we have another one indicating the days' supply of finished gasoline. Both finished and unfinished gasoline were in this section (indicating); but here, since only finished gasoline can be shipped to the motorist, we only considered that type of gasoline in making up this section (indicating), which shows the days' supply of finished gasoline available for shipment to the motorist at the end of each month.

2838 We find here that there were 50.6 days of finished gasoline in storage and available for shipment at the end of January, 1935, continually going downward through the month of September, 1935, where we find 32.2 days' supply available. That, you will notice, is the lowest point of days' supply during this entire 2 year period. Then we start upward again, to a high point in January, 1936 of 51.4 (indicating), and then on down continuously again through August, with 34.1 days (indicating), and September, which usually shows a little less than August, just slightly higher than August. Then we go on upward through the remainder of the year, according to seasonal requirements of gasoline.

Not all of this gasoline that I have just referred to under the heading of days' supply of finished gasoline, is available for shipment if the industry is to continue operating. It is all, however, contained in this section.

This chart, Exhibit 953, we call "Statistics of Crude Oil and Gasoline, Section 1," showing the gasoline supply and demand situation during this 2 year period.

Exhibit 954 is the chart headed, "No. 2, Statistics of Crude Oil and Gasoline." Again, at the top, we present the gasoline price line which is the same as that on No. 1, Exhibit 953 (indicating), and also the crude oil price line, which is the same as on Exhibit 953, exactly the same prices (indicating). The gasoline prices and crude oil posted prices are the same on No. 2 as they are on No. 1.

2839 Coming down to this section here (indicating), we find the United States crude oil production, the total for each month during the period from January, 1935 through December, 1936. The figure at the top of each brown column indicates the actual production of crude oil in each month.

In January, 1935 (indicating) actual production in the United States of crude oil was 78,720,000 barrels. The figures immediately below there, or in each instance the figure immediately above the red line, indicates the amount of crude oil that the Bureau of Mines of the United States Department of the Interior recommended be produced during that month. Back here in the months of January, February, March, April, May and June, 1935, the recommendations were those of the Petroleum Administrative Board, acting under the Oil Administrator. From then on, that is, from July, 1935 through December, 1936, they were estimates of the United States Bureau of Mines.

The Bureau recommended a crude oil production which was continuously under the actual production. In other words, the actual production through this entire period from January, 1935 through December, 1936, was above that which was recommended by the Bureau of Mines.

We find that the crude oil production was very
2840 much higher than that recommended by the Bureau.

In September, 1935, there were 6,000,000 barrels more crude oil produced than the Bureau of Mines recommended.

In October, 1935 (indicating) there was 9,500,000 barrels more crude oil produced than the Bureau recommended. In November, there was almost 10,000,000 more barrels produced than the Bureau recommended; and the same held true in December, 1935.

Coming over into 1936, we find that January production was very much higher than the Bureau recommended, almost 9,000,000 again (indicating); and the trend generally continued throughout the year, in some cases, the over-production being smaller than in others. In July (indicating) we find that the over-production was about 1,600,000 barrels; and then we go on into larger ones, showing October, 1936 with an over-production of almost 10,000,000 barrels during that one month.

The chart shows the total over-production of each year. During the year 1935 the Bureau of Mines and the Petroleum Administrative Board, working during different periods of that year, together recommended a production of approximately 938,000,000 barrels of crude oil. Actual production was 997,000,000. There is almost 60,000,000 barrels more crude oil produced than the Bureau of Mines and the Petroleum Administrative Board recommended.

2841 In 1936 the Bureau of Mines recommended a production of 1,030,000,000. Actual production was approximately 1,099,000,000 barrels. In other words, the actual production during that year was almost 70,000,000 barrels more than the Bureau of Mines recommended.

This chart (indicating) again shows by months during 1935 and 1936 the actual amount of crude oil in storage at the end of each month. Immediately above the column representing each month during that 2 year period, we find the amount of crude oil in storage, expressed in barrels.

These figures run pretty high. Along the side here (indicating), we have figures indicating a scale, whereby each column can be read. We have, however, provided the actual figures. That is true in all these other charts. But in this one, we have figures running up as high as 340,000,000 barrels. For that reason this particular chart would take up pretty nearly this whole sheet of linen and so we have had to break it here (indicating), and have indicated a break, and pulled the scale down to the very interesting point of the chart. For that reason, we have shown a break in this, through the medium of that white line (indicating). Stocks declined slightly during February and then went on up slightly during March and April.

2842 From then on, the trend was continuously downward, showing a decline from about 340,000,000 barrels at the end of April, to about 315,000,000 barrels at the end of December, 1935. That is a draft during that year of about 25,000,000 barrels. The crude oil inventories were establishing new lows over a period of many years during all of that period from April through December.

In January, and through February, 1936, the trend downward continued. The trend then changed upward through March and April, and started on down again through December, 1936, at which point it established the lowest level of crude oil in storage above ground since 1922. You will find that the down trend started at the end of April, with 315,000,000 barrels of crude oil in storage. The year ended with 288,000,000. That is a draft of almost 27,000,000 barrels in 8 months.

In spite of producing more crude oil than was recommended by the Bureau of Mines and the Petroleum Administrative Board, the demand was so high that stocks steadily declined in 1935 and 1936. That is the significant part of these two charts.

In 1935 the industry produced almost 60,000,000 barrels more than the Bureau recommended, but nevertheless withdrew, I don't have the other figure here, but during the 11 months withdrew almost 25,000,000 barrels in order to satisfy the demand for gasoline and other refined products, gasoline being the only one shown here.

2843 The story for 1936 is that, even though the industry produced almost 70,000,000 barrels more than the Bureau of Mines recommended, crude oil was withdrawn to the extent of about 28,000,000 barrels in order to supply the demand for gasoline. That is why I say inventories were brought to the lowest point since 1922. All through this latter part of 1936 and up through the latter part of 1935, we were establishing new lows of crude oil in storage above ground for about 15 years.

The graph at the bottom of this chart (indicating), Exhibit 954, Chart No. 2, shows graphically the trend of the inventories of crude oil. There is a black line drawn across the chart from left to right, indicating a zero line (indicating). Anything above that line is an increase in crude oil inventories, while anything below it shows a decrease in those inventories. There is a total for each month during that 2 year period, which shows the change in that month.

You will notice up here, in the crude oil inventories, the actual figures on Chart No. 2, that the crude oil stocks declined in February of 1935. That is shown in a block below the zero line, which runs across the chart from left to right. Here in March (indicating) we find that crude oil inventories increased from 337,000,000, approximately, to 339,000,000. That is shown in a brown column down here (indicating). In other words, out of the
2844 24 months in the two years, crude oil inventories
increased in 5 months, and decreased in 19 months.

There were particularly large withdrawals of crude oil in June, July, August and September, 1935. The withdrawals declined slightly towards the end of the year and then they began again in January and February, 1936. In March and April, 1936 there were increases. You see that right up here in this chart of crude oil inventories, the total amount in storage at the end of the month (indicating).

During May, 1936 there was a slight decline, and beginning with June, July, August and September we have very heavy withdrawals. In June, 1936 the figure was 4,100,000 barrels withdrawn; July, 4,700,000 approximately, and the same amount in August, while during September we find a draft of over 6,000,000 barrels. During October and November the average was about 3,300,000 barrels withdrawn, and in December about 800,000 barrels.

Referring to these charts, I will explain the factors which affected the price of gasoline in the Mid-Continent spot market, as reflected by the graph at the top of each chart.

We find, on January 1, 1935, a strong situation. We find the price of crude oil in both East Texas and Oklahoma at $1.00. We find the gasoline demand for January slightly over the amount forecast by the Bureau of Mines, but showing a decline when compared with January of the
previous year. That was, as we said, beyond doubt
2845 due to the extreme weather during that month, and
not indicative of any change in the trend. Due to seasonal requirements, at the end of January we find a days' supply of 50.6 days. We find the crude oil production running a little bit above that recommended by the Bureau of Mines. We find crude oil inventories high, but at a low level compared with previous periods, crude oil inventories being absolutely under control because it was necessary when withdrawing crude oil from storage during that period from January through May, 1935 to obtain permission from the Petroleum Administrator to make such drafts.

In other words, we find a strong situation throughout the industry, with the exception of the situation in East Texas. The hot oil situation in East Texas was one denoting considerable anxiety, due to the tremendous potentialities of that field and the tremendous potentialities in interstate commerce, and commerce in general, of the hot oil refineries in that locality at that time.

The Federal Tender Board was operating during the first of January under authority of Section 9(c) of the National Industrial Recovery Act. We find the Board operating but we also find that the authority of the Board was being attacked in the Supreme Court by the hot oil operators in East Texas, and that as a result, there was considerable anxiety in the field.

2846 With January, in which the Supreme Court declared Section 9(c) of the Industrial Recovery Act invalid, we began loosening the tremendous potentialities of the field and also of the hot oil refineries there, and after a period of steadiness of prices, we find following that decision a recession in price coming down to about February 4th. The price dropped down through January until the beginning of February, 1935. During February we find the price levelling off, and also find the crude oil price at $1.00.

We find there the gasoline demand increasing slightly but yet slightly below that which was expected by the Bureau of Mines. In other words, that was the first month in which the Bureau, for some time, had over-estimated the demand.

We find also that during the month of February, 1935 the gasoline stocks tended to increase slightly more than seasonal. In other words, the gasoline demand was less than expected and stocks went up. We find that crude oil production was again higher than that recommended by the Bureau of Mines, but there was a slight draft on crude oil inventories during that month.

Also we know that during the period immediately following the Supreme Court invalidation of Section 9(c) there was considerable thought in Congress as to this situation which was developing again in East Texas
2847 and was for the moment out of control, and after approximately a period of a few weeks, Congress passed the Connally Act, which made it illegal to pass into interstate commerce any crude oil produced in excess of state allowables or the products of that hot crude oil in the form of hot gasoline.

We come into the period immediately following the President's signing of the Connally Act when we have the appointment on March 1st of the Federal Tender Board, and the first issuance of tenders by that Board on March 4th.

This Connally Act was written to meet the objections made by the Supreme Court to the original Section 9(c) of the NIRA. It was written specifically to overcome those objections, and finally the industry knew, and the men who were running the hot oil in East Texas realized, that here was a law that they had to obey, and they immediately set out obeying it, apparently. It made it necessary for them to run on legally produced, $1.00 crude oil.

During this period, here between the end of the first

Federal Tender Board, on January 7, 1935, and March 1st, when the Connally Act was passed, which shut out of interstate commerce hot gasoline and hot crude oil, the number of hot crude oil refineries first increased and then after the Connally Act declined considerably until there were only 14 in number; 8 of them shipping in interstate commerce and 6 of them shipping on tenders in Texas.

2848 We then come to the period from March 4 through to June 6, 1935, which is one of increasing gasoline prices. It is significant that the first increase in price took place on March 4th, which was the date of the issuance of the first Federal tenders under the Connally Act. We find a situation there that indicates strength.

However, we recall that during February stocks had increased slightly more than seasonal; the strength in this entire situation was such that barring any abnormal depressing factors the price of gasoline would be driven upward to approximate parity with crude oil.

During this entire period gasoline demand went up considerably. During March the increase was 4.2%; during April approximately 6%; during May approximately 3%. The demand of the retail market, therefore, was continually higher than the Bureau had anticipated.

It is my opinion that this situation was inherently strong enough to have pushed the price of gasoline up to an approximate parity with crude. However, I had general knowledge of buying by major companies of so-called distress gasoline from independent refiners. I did not know the extent or nature of such buying, but in that it removed so-called distress gasoline, which was overhanging and depressing this market, it did have an effect on price. But the situation was so strong here during the period from March 4 to June 1, 1935, (indicating on chart) with 2849 respect to gasoline demand, it being considerably above the demand anticipated by the Bureau of Mines, that there was a continuous decline in the gasoline stocks to below seasonal requirements. The days' supply, and the strong situation here (indicating) of crude oil, even though it was much above that recommended by the Bureau of Mines, necessitated further withdrawals from storage in order to meet the demand for refined products.

It is my opinion that whatever buying was done had only a temporary and incidental effect and that it did not in any way tend to increase the price of gasoline to a level higher than the natural working of the law of supply and demand would have forced it.

We now come to the period from ~~about~~ June 7, 1935 to approximately January 10, 1936. We find this large demand for gasoline continuing, June, 1935 showing 6.8% increase when compared with June, 1934, and all subsequent months except November showing increases.

During that entire period, with the exception of September, the Bureau of Mines under-estimated demand to as high as approximately 4,500,000 barrels in October. In September the Bureau of Mines over-estimated demand by slightly over 100,000 barrels.

Gasoline inventories, we noted, were coming down (indicating on chart), gradually establishing a low level at
the end of October. Crude oil production was con-
2850 siderably higher than recommended by the Bureau
of Mines, but there was a terrific draft on stocks during the entire year, the total there being 22,000,000 barrels of crude oil withdrawn from storage during 1935.

During that period, June 7, 1935 to January 10, 1936, we find a level price for crude oil at $1.00 a barrel for both grades indicated on this chart; something we didn't expect to occur back in February, 1935 when the interstate compact was made.

We considered the interstate compact in February, 1935 and it became effective in August, 1935. It was passed first by Congress, of course, and it gave the six states signatory to it, Oklahoma, Kansas, Texas, New Mexico, Colorado, and Illinois, beginning with August, the right to get around a table and discuss their mutual problems of keeping the actual crude oil production within the market demand therefor. Prior to that date these States did not have the legal right to get together and keep the crude oil production of the United States in balance with demand. In other words, they didn't have the legal right to discuss their mutual problems and keep within the total demand for crude oil as recommended by those whom they consulted in the Bureau of Mines.

The states didn't have the right to keep the state production within the estimated demand for the United States because it was illegal. I presume the anti-trust laws had something to do with it, but the Circuit Court of Appeals
held that that was so.

2851 I think the Constitution of the United States pro-
vides that in order for states to make a compact, there has to be an authorization by Congress. Congress authorized this compact, and it became effective in August, 1935. Anyway, the fact is that the states had not done it prior to that.

On January 10 to 12, 1936, we find an increase in both grades of gasoline. That was, beyond a doubt, due to the increased price of crude oil which took effect on January 9, 1936, the price of East Texas grade crude being increased from $1.00 to $1.15 on that day, and the price of Oklahoma crude being increased from $1.00 to $1.10.

However, we still find the situation continuing strong during January, 1936, demand increasing 15.5%.

Stocks during January, 1936 did not increase any more than the seasonal requirements necessitated. Crude oil production was considerably higher than the amount recommended by the Bureau of Mines, almost 9,500,000, but there was a withdrawal of crude oil from storage during that month of 1,800,000 barrels.

It is unusual over a long period of time to have that amount of withdrawal of stocks in January. It is to the best interests of producers, I think, for crude to increase during the winter and be drawn on during summer. It is of considerable assistance to the state regulatory body to keep crude oil production running along at a level rate
2852 rather than to have the opening and closing of the
valves. It is a little easier, I think, to suggest to the producer that he open the valve rather than that he close it. And for that reason it is so desirable to keep the level of crude oil production on this line (indicating) over a long period of time, or, as was the case here, to have an increasing upward trend moving along at a slightly accelerating pace all the time.

We found the price of gasoline increasing between January 10th and 12th as a result of the increase in the price of crude oil on January 9, 1936.

Through the second two-thirds of January, 1936 the price levels off, but weakens during the middle and the end of February, 1936.

We notice that the demand for gasoline during February, 1936 was for the first time in many months under the demand anticipated by the Bureau of Mines. As a result of that condition, gasoline demand less than anticipated and refineries anticipating higher demand, gasoline inventories went up during February, 1936 more than seasonally.

The demand in February, 1936 was very greatly affected by the extreme weather during that month, and resulted in a more than seasonal increase in gasoline inventories. The days' supply, however, didn't change much. In February we find again a large amount of crude oil production in excess of that recommended by the Bureau of Mines, but we also find a decline in crude oil inventories.

2853 We know up here (indicating) that this point was affected by the conditions of demand here (indicating), but less than anticipated; and also by the fact that for the first time "no-octane" gasoline produced in the Rodessa field in Louisiana made its appearance in the market. The Rodessa field is in the general vicinity of the East Texas field. It is a point where Arkansas and Louisiana and Texas meet, the geographical area which was thought to be favorable to the accumulation of oil stretching across those three states. It was considered at one time that Rodessa would perhaps create another East Texas problem, Arkansas and Louisiana not having at that time a state proration law, while Texas did. Production was found in Louisiana, and later it spread over into Texas. However, Louisiana later began regulating crude oil production in the state under their conservation laws. That field was opened in 1935, but the production did not come up to sizeable amounts until the latter part of January and February, 1936.

From then on, the gasoline price came along on a level point through March. In April we find it strengthening a little bit. Rodessa gasoline was not in the market as strongly as it was at that time, and the state began to regulate production there in accordance with the state conservation laws, and the situation improved to some extent.

Seasonal stocks of gasoline had increased more than seasonal requirements required during February, 1936, and at the end of March there was slightly more seasonal gasoline in storage than legal requirements called for.

2854 After the price levelled off during March and April, 1936 we come into a period in the latter part of May which shows a decline in the price of gasoline. That decline was in the face of an otherwise strong situation in the demand for gasoline. Again, during that period the Bureau of Mines had under-estimated actual demand, but it was a period following rather slightly declining seasonal inventories. However, no-octane gasoline from Rodessa really came into the market during May, 1936.

Rodessa crude is not a very desirable grade of crude oil, and the gasoline produced from it is a very low anti-knock quality, and we say "no-octane" or "no-octane rating."

This gasoline came into the market from Rodessa in increased quantities during May, 1936, the situation down there not being in as good control as it had been during this level period of March and April.

We now come to June, July and August, 1936, which shows during June the continued effect of the no-octane gasoline from Rodessa, which straightened itself out again in July and the early part of August.

During this entire period we have been carrying higher than seasonal inventories in gasoline. There had been a seasonal increase that was larger than minimum requirements indicated in February, 1936, which carried through March, 1936, and which did not liquidate itself during the early part of the high consuming season.

2855 Normally when there is an inventory above minimum seasonal requirements at the beginning of a high consuming season, one watches for a price reaction. However, he may not be as definitely concerned when such amounts above the minimum requirements exist at the beginning of a season as when they exist toward the end of the season. In other words, seasonal inventories other than minimum requirements are not the menace to prices early in the season that they are toward the close of the season, or the beginning of the low consuming months.

During August and September, 1936 there was a surplus in seasonal requirements in the Oklahoma-Kansas region, and a slight surplus of seasonal requirements in the Indiana-Illinois region.

During October and the early part of November, 1936, the price remained fairly stationary, the demand coming along beautifully during that period of the year. September showed a 14% increase in demand, October a 6.2% increase, November an 8.6% increase. Seasonal stocks were at a low level during September and October, with November showing only a very slight increase. The price rose in November very, very slightly, and then levelled off during the year.

During December, 1936 demand increased 11.8% when compared with December, 1935, which was 14.7% above December, 1934. In other words, the demand for gasoline in December, 1936 was approximately 27% above the
2856 demand for gasoline during December, 1934.

We find the price of crude oil during this entire period remained steady. Crude oil production in every month was above that recommended by the Bureau of Mines, but crude oil inventories declined from the peak for that year of 315,000,000 barrels at the end of April to 288,000,000 at the end of 1936. That 288,000,000, as we said earlier, was a new low in crude oil inventories above ground since 1922.

The actual withdrawals of crude oil from storage in those months are indicated in the lowest section of the chart, running to as much as 4,500,000 to 6,000,000 barrels a month.

Summing up for 1936, we find that the demand for gasoline actually increased about 9½%, an actual increase of about 9,500,000 barrels above that which was expected by the Bureau of Mines, or approximately 350,000,000 gallons; that crude oil production during the year was about 70,000,000 barrels above that recommended by the Bureau of Mines, but that nevertheless in order to supply the large demand for gasoline and other products crude oil was withdrawn from storage to the extent of approximately 27,000,000 barrels during 1936.

In the American Petroleum Institute we have records which reflect the prices of gasoline and the trend of those prices in the United States. Those records have been kept under my direction and I have custody of them. 2857 We have prepared a chart setting forth statistically and graphically gasoline prices and price trends. This chart sets forth the data contained in the records in my custody.

We have records showing the tank wagon price of gasoline from 1918 through 1936 in 50 representative cities throughout the United States, two in New York state, one in each of the other states, and one in the District of Columbia. Those prices also represent the service station price of gasoline, the state tax and the federal tax; also the service station price including the tax. That same series exists since 1918. They were selected in 1918 as representative of marketing and demand conditions within each city.

Q. And what does that chart reflect?

Mr. Chaffetz: That is objected to. If your Honor please, we object to any charts or any data about trend of prices from 1918. If we are going back to 1918 to find out what prices were, then we have got to make an inquiry year by year as to what the factors were that entered into the price, and all the varying factors that enter into the industry over a period—how far back is 1918 from 1937?

The Court: Objection sustained. Exception allowed.

2858 Mr. Thomas: It hasn't been offered yet.

Mr. Chaffetz: My objection was to the entire line of testimony.

The Court: There is an objection to the admission of this exhibit?

Mr. Chaffetz: Oh, we don't object to it on the ground of the authenticity. We object on the grounds we have stated.

Mr. Donovan: Yes, of the materiality?

Mr. Chaffetz: The materiality, yes.

(Chart referred to is marked Exhibit 955 for identification.)

Mr. Donovan: Now, I offer in evidence the chart referred to by the witness, Exhibit 955, being "Gasoline Prices, 1918 to 1936, of the Major Marketing Companies, Average United States, Fifty Representative Cities," with simple averages each year. Also showing the weighted monthly average of crude oil prices in the United States for the same period.

The Court: The offer has been made, and you have made your objection?

Mr. Chaffetz: Objection made, yes, sir.

The Court: Have you stated your objection, your reasons?

Mr. Chaffetz: Immateriality, and irrelevancy.

2859 The Court: Objection sustained. Exception allowed.

(Copy of Exhibit 955 for identification is handed to the Court by Mr. Donovan.)

(The following proceedings were had in the absence of the jury.)

Offer of Proof re Trend of Gasoline and Crude Prices 1918-1936.

Mr. Donovan: If Fred Van Covern were permitted to answer the first question below, and other questions which would have followed this one concerning Exhibit 955 for identification, he would testify as follows:

Q. And what does that chart, Exhibit 955 for identification, reflect?

A. It indicates the weighted monthly average crude oil prices in the United States, the tank wagon price of gasoline in 50 representative cities throughout the United States, the service station price exclusive of tax, and the service station price including tax, for the period January, 1918 to and including December, 1936.

Q. State whether or not this chart reflects the relationship, if any, between crude prices and gasoline prices.

A. It does.

Q. Will you please describe such relationship?

2860 A. In the period from January, 1918 through August, 1933, the trend of prices in crude oil and gasoline rose and fell, generally with each other. This is strikingly illustrated, for example, in the year 1920, when the price of crude oil rose rapidly during the first few months of that year, levelled off during the latter part of the year, and fell rapidly during the first few months of 1921. The price of gasoline followed the trend of crude oil almost exactly. From then until August, 1933 the peaks and valleys in price trends of both crude oil and gasoline followed each other. In September, 1933 the price of crude oil was moved up to $1.00 and was maintained at that level from then through the summer of 1935. In March, 1936 the price of crude rose to a level slightly above $1.00 as an average for the United States as a whole. The price of gasoline during the period from September, 1933, through June, 1935, followed a very different course. In October, 1933 a decline in gasoline prices set in, but the trend changed in about May, 1934, rising slightly, but soon after that a very rapid descent began which terminated in December, 1934. Gasoline prices then began to rise and reached a high point in 1935 on September 1st. There was
2861 then a slight decline, with a levelling off during the end of 1935. Early in 1936, apparently responding to the rise in crude oil prices, the price of gasoline rose slightly, fell off through March and April, but again rose in May to a level where it remained steady through August. The trend throughout the remainder of 1936 was slightly downward.

Q. What was the general trend of service station gasoline prices from 1920 to 1936?

A. The general trend during that period was consistently downward from a high in 1920 of 32¢ to a low of about 11¢ in 1933. After this low it rose and established a level of about 14¢ in 1936. These figures are exclusive of taxes.

Q. Comparing the service station price in 1920 with the service station price in 1936, excluding taxes in both cases, what is the percentage of changes?

A. The 1936 station price, excluding taxes, is about 47% of the 1920 service station price, excluding taxes.

Mr. Chaffetz: The Government objects to that offer of proof.

The Court: Objection sustained; exception allowed.

(The following proceedings were had in the presence of the jury.)

There has been a very definite relationship between
2862 the prices of crude and of gasoline through a long period of time.

The general economic conditions of the country improved in 1935 and 1936 over the conditions that existed in the years immediately preceding. This improvement was accompanied by increases in the prices of all commodities and materials. I have compared the prices of gasoline, including the refinery tank car market prices, the tank wagon prices and the retail prices in effect during the years 1935 and 1936, with the prices of other commodities and materials.

Mr. Donovan: The following Exhibits for identification are offered in evidence: 956, 957, 958, and 959.

Mr. Chaffetz: Those are objected to, if your Honor please. If we are going to take up the comparison of the prices of those commodities with the prices of [illegible] then we have got to find out what factors entered into the prices of those other commodities.

I didn't object when he asked the general questions as to whether there weren't better economic conditions in these years and whether prices generally weren't up, but I object to taking up specific commodities.

2863 Mr. Lewin: We would have 18 different cases to try if we should go back to 1918. Here, depending upon the number of commodities they select, we have got just that many other cases to try.

Mr. Donovan: The charge made by these gentlemen against us is that these prices were high, arbitrary and non-competitive. And they have asked the jury to draw the inference that that was so because of the rise in price during a particular period.

Now, I think that we ought to be entitled to show that this rise in price which appeared there in relation to the oil industry was not something abnormal and unnatural and improper and illegal, but that the same thing was happening at the same period, during the same time with other commodities. And it seems to me that it is a perfectly proper thing to do.

The Court: I think you ought not to specify certain articles, for instance, dairy products, textiles, household furniture, and so on. I think it is sufficient that the jury—we all know that prices of all commodities have risen during the past 2 years.

The objections to these exhibits are sustained. Exception allowed.

2864 Mr. Donovan: You do not raise the question of its authenticity?

Mr. Lewin: No, sir, we don't raise any question except materiality, relevancy and competency.

The Court: These exhibits are interesting, but I think they would mean just that many more suits.

Mr. Donovan: Now, in your study of statistical —your Honor, may we reserve the right—I don't want to upset it now, but we have offers of proof on that last material.

The Court: ~~Yes, you~~ may make those.

(The following proceedings were had in the absence of the jury.)

Offer of Proof Re Various Commodity Prices Compared With Gasoline Prices.

Mr. Donovan: Exhibits 956, 957, 958 and 959 for identification were offered in evidence. The Government objected to the introduction of these charts on the ground that they were irrelevant, immaterial and incompetent. The objection as to each was sustained by the Court.

The Court granted permission to defense counsel to make offers of proof on the subject matter contained in the above mentioned charts.

There can be no question of the competency of this testimony of Fred Van Covern concerning price
2865 comparisons. The witness went to the only available source to obtain the data for his comparisons, which, in the majority of cases, was one department or another of the United States Government.

The Government charges the defendants with conspiring to fix high, arbitrary and artificial prices. One test or method of determining whether prices are fixed or are high is to compare such prices with prices for other commodities. If, in making price comparisons, it is found that the price for the commodity in question is below the prices of other commodities generally, there is, of course, an inference that the price for the commodity in question was not fixed. Gasoline prices were uniformly lower than other commodity prices throughout 1935 and 1936. It is submitted that the defendants are entitled to whatever inferences the jury may draw from such price comparisons and that this testimony would create an inference that no combination to fix prices was effected by the defendants in this case.

The Government, admittedly, has sought to establish its case by circumstantial evidence. There is, in fact, no direct evidence of an agreement to fix prices. 2866 Their case depends on inferences to be drawn from circumstances. The defendants, therefore, should be permitted to introduce any circumstances from which an inference of innocence can reasonably be drawn.

If Fred Van Covern were permitted to testify concerning the comparisons of various commodity prices with gasoline prices during the years 1935 and 1936, he would testify as follows:

Q. Were Exhibits 956, 957, 958 and 959 for identification prepared under your supervision?

A. Yes.

Q. On the bottom of each of these charts, Exhibits 956, 957, 958 and 959 for identification, there is a legend entitled "Source". What is included in each of these legends?

A. In each legend I have indicated the source from which I took the data reflected on each chart.

Q. Most of the source material seems to have been taken from data compiled by some department of the United States Government. In such statistical data, state, if you know, what standard is employed by Government statisticians for the purpose of making price comparisons.

A. They use what is called the Index Number to compare the prices indicated for the various years included on these charts, and they have assumed that 2867 the 1926 price equals 100% or par.

Q. State, if you know, why the prices in effect during the year 1926 were selected as the standard for the purpose of comparison.

A. The year 1926 was selected as the standard for purposes of comparison by Government statisticians because it was considered that prices during that year represented levels more nearly normal than any other years since that time.

Q. Do each of the Exhibits 956, 957, 958 and 959 for identification, accurately set forth in graphic form the statistical data obtained from the source material indicated at the bottom of each chart?

A. They do.

Q. Exhibit 956 for identification reflects nine charts. On each chart the wholesale price of gasoline is compared with the trend of prices of some other product or products. These other trends are all commodities, all farm products, grains, foods, dairy products, textile products, fuel and lighting, building materials, house furnishing goods. Will you please describe these various comparisons and explain the method employed in making such comparisons?

A. This chart compares the relationship between 2868 the wholesale Oklahoma market refining prices for gasoline and other commodity groups, during the years 1926 to and including 1936, and again 1926 equals 100 or par. In comparing the prices of all commodities with gasoline, we find that the prices of gasoline were under the level of the prices of all commodities during the entire period, when these prices are related to the 1926 level. The price of gasoline went down considerably in 1927, rose some in 1928 to a point about 15% below its 1926 level. Another decline set in and rapid decreases occurred through 1931. The price of gasoline increased slightly in 1932 and fell off again in 1933 to approximately the 1931 level. From then on, through 1934, 1935 and 1936 the price of gasoline increased until for the entire year of 1936 there was indicated a price about 31% below the 1926 level. In the all commodity group, prices fell under their 1926 level only slightly during 1927, 1928 and 1929. In the latter year they were about 5% below their 1926 level. Prices in this group began a decline in 1929 which ran through 1932. They were then indicating a price level of about 35% less than the 1926 level.

The all commodity group rose slightly in 1933 and then began a rapid increase which lasted through 2869 1934 and 1935 and went still higher in 1936. The significant part of this chart is that the price of gasoline not only was lower than the prices of all commodities throughout the entire period in relation to 1936, but that also for the entire period they average about 15% lower than the all commodity group.

The same situation generally exists as existed in the gasoline and oil commodities in comparison with respect to foods, fuel and lighting, all farm products, dairy products, building materials groups, textile products and house furnishing goods. All farm products, however, showed an increase in 1928 and 1929, as related to their 1926 level, dairy products indicated an increase in 1927, 1928 and 1929 above 1926, and in the case of grains, an increase in 1927 and 1928. But there is one other difference between the trend of grains and gasoline in that the price of gasoline in the year 1932 was slightly higher than the price of grains, the grain price in relation to its 1926 level being 60% below, while gasoline was about 57% below the 1926 price. Grain prices rose very rapidly, however, from 1932 through 1936, while the price of gasoline rose very much more slowly.

Q. Exhibit 957 for identification reflects 8 charts. On each chart the wholesale price of gasoline is com-
2870 pared with the wholesale price of one individual food. These individual foods are corn, wheat, flour, potatoes, eggs, cattle, hogs and lambs. Will you please describe these various comparisons and explain the method employed in making such comparisons?

A. The method of comparison that has been used on this chart is the same as on the other price charts, again 1926 equalling 100, or par.

The wholesale Oklahoma refinery price of gasoline was less during the entire period than the prices of flour, eggs and cattle.. In the case of corn, prices rose very rapidly in 1927 and 1928 when it reached a level of 29% above its 1926 price, fell off quite rapidly during the period from 1929 to 1932, which was the only year in this entire period in which corn was lower in price relatively than gasoline, both groups showing a decrease as compared with the 1926 level of about 58%. Corn prices then rose very rapidly and went above their 1926 level in 1935. They continued upward through 1936 until they were 13% above their 1926 prices, while gasoline in 1936 was 43% below its 1926 level.

In the case of wheat, we find again that 1932 is the only year in which the price of wheat was less than the price of gasoline. The relationship there
2871 indicates that while gasoline prices were 57% below their 1926 level, the price of wheat was 61% below

its level of 1926. As in the case of corn, wheat prices rose very rapidly from 1932 to 1936, indicating the price in the latter year about 19% below the 1926 level, while gasoline shows a decline from its 1926 level of about 43%.

Potatoes fluctuated considerably during this entire period, being under the price of gasoline 3 times during the 11 years, the fluctuation in the price of potatoes being very pronounced as compared with the price of gasoline.

In the case of hogs relative to gasoline, we find that prices would have been less than the price of gasoline in 192[illegible] 1932, 1933 and 1934, but that during 1935 and 1936 the price of hogs recovered very rapidly when compared with gasoline. The relationships at the end of 1936 indicate that the price of hogs was 21% less than its 1926 level, while the gasoline price was 43% below.

In the case of lambs, we again find the price of that commodity less than gasoline in 1932, but only very slightly. In that year gasoline prices were 57% less than in 1926, while the price of lambs was about 58% less. Gasoline went down in 1933 while the price of lambs went up. From there on, recovery in the price of that commodity was somewhat faster
2872 than was the recovery in the price of gasoline, until at the end of 1936 we find the price of lambs 31% below their 1926 level, while gasoline was about 43% below its 1926 level.

Q. Exhibit 958 for identification is a chart showing index of gasoline prices (tank wagon, exclusive of tax) compared to index of cost of living and index of wholesale price of all commodities in the United States. Will you please describe the comparisons of these trends throughout the period 1918 to and including 1936?

A. It should be noted that in this chart, as well as in the others presented, the 1926 level of three items mentioned, all commodities, gasoline tank wagon, excluding tax, and the cost of living, has been placed at 100 or par. The cost of living rose from about 93 in 1918 to about 115 in 1920. During the following year it fell very sharply and indicated in 1921 a level just below par. In 1922 there was another slight decrease, but in 1923 and 1924 the cost of living rose slightly and in 1924 it reached 98%, while 1925 was at 100 or par, as was 1926 also. During 1927 there was a decline which leveled off at about 96 in 1928 and 1929.

2873 The cost of living dropped in 1930 to about 93 or 7% less than in 1926. In 1931 it registered about 84 and by 1932 had declined to 75. It rose in 1933 to about 72, and that began a continuous upward trend through to 1936, which registered about 82, indicating that the cost of living in that year was about 18% less than the cost of living in 1926. In relation to the cost of living, the gasoline prices travelled in a very much similar trend. Gasoline prices peaked in 1920, indicating that during that year they were slightly more than 50% higher than the 1926 level, and then began a continuous decline in those prices through 1921, 1922, and 1923, and in 1924 the level indicated is 92, showing a decline from 152 in 1920 to 92 in 1924, or a decrease of about 40% in four years. The 1925 figure is 95, and of course the 1926 figure is par. 1927 prices dropped to about 85, where they stayed through 1929. There was a drop in 1930 and by 1931 a low level of 64 was reached. 1932 fluctuated up slightly and then down in 1933 to about 63. A rise is indicated in 1934 to about 67 and in 1935 a drop to about 66. In 1936 the gasoline price level registered about 69, showing that the prices of gasoline during this year were about 31% less than the 1926 level, indicating, in the

2874 case of gasoline, that the recovery in the price of that product was very much slower than the increase in all other commodities and in the level of the cost of living during the years 1933, 1934, 1935 and 1936.

In the case of all commodities, the high price level was registered in 1920 when we had an index number of about 154, or the indication that prices of all commodities combined in that year were 56 above par. There was a sharp decline in 1921 to a price level of about 98. 1922 was slightly lower, and 1923 rose to about 101, which was just slightly above par. 1924 showed a level of about 98, with 104 being registered in 1925, and again 1926 is indicated at par. The levels for 1927, 1928 and 1929 were constantly around 96. A price decline then set in and ran through 1932, which is indicated at 65 or about 35% below the 1926 level. 1933 rose to 66 and then, gaining momentum, went up in 1934 to 75, 1935 to 80 and in 1936 to about 81.

Q. Referring specifically to the period 1926 to 1936, how does the trend of gasoline prices, as reflected by chart, Exhibit 958 for identification, compare with the trend of all commodity prices and the cost of living?

2875 A. With the exception of 1932, the gasoline price trend was below both of the others, but even in that year it was below the cost of living index and only slightly higher than the cost of all commodities.

Q. What was the trend of the gasoline prices, as reflected on Exhibit 958 for identification, for the years 1935 and 1936?

A. In 1935 the gasoline level was slightly less than in 1934. It increased during 1936, however, but in spite of that it was 13 points, or practically 16% below both the cost of living and the all commodities index.

Q. Referring to Exhibit 959 for identification, will you please compare and describe the trend of the index of gasoline tank wagon price, exclusive of tax, with the index of wholesale dairy products for the period 1918 through 1936?

A. As in each of the other charts the 1926 level of prices for dairy products and for gasoline is indicated as 100 or par. The prices of dairy products rose during 1927, 1928, and 1929 to about 106, or 6% above the 1926 level. Then set in a rapid decline, passing through 1930, 1931 and 1932, the latter year registering about 61 or 39% below the level of 1926.
2876 1933 also established a level of about 39% below 1926, and then a recovery set in, the level climbing to 73 in 1934, 80 in 1935, and about 84 in 1936. Gasoline, in relation to dairy products, indicates a constantly lower level through 1927, 1928, 1929, 1930 and 1931, indicating in the latter year about 64 in comparison with about 82 for dairy products. The price of gasoline recovered slightly in 1932 and in that year was above dairy products and remained slightly above dairy products in 1933. Dairy products went above gasoline in 1934 and continued in 1934 to about 67, while 1935 registered about 65, when dairy products were at about 80. Gasoline for 1936 registered about 69, while dairy products were about 84. In other words, during 1935 and 1936 gasoline was about

15 points below the level of the prices of dairy products in relation to the par of 1926.

Q. Have you made studies similar to those reflected on the four charts, Exhibits 956, 957, and 959 for identification, concerning the tank wagon price, exclusive of tax, with prices for food, fuel and lighting, building materials, textile products and house furnishing goods?

A. I have.

2877 Q. In making this study, did you examine the Government's statistics taken from the same sources in ascertaining price levels of the various commodities and materials, gasoline excepted, mentioned in the last question?

A. I did.

Q. Will you please compare the tank wagon price of gasoline with the price of food in relation to the 1926 levels of these commodities, confining yourself to 1935 and 1936?

A. The levels of prices of food products during 1935 stood at about 84, or 16% less than the 1926 level; tank wagon gasoline prices, exclusive of tax, in 1935 were about 35% less than the 1926 level. The level of food prices in 1936 was about 82, while the gasoline price level was at 68, indicating that the level of gasoline prices in 1936 was 31% below 1926 and food prices were only 18% less than in 1926.

Q. During the period 1926 to 1936, how did the index of tank wagon gasoline prices, exclusive of tax, compare with the index of the food prices?

A. Gasoline prices, with the exception of 1931, 1932 and 1933, were consistently below the level of food prices during this entire period.

2878 Q. Again confining yourself to 1935 and 1936, will you state the situation in respect to the tank wagon prices of gasoline as compared with prices of fuel and lighting?

A. The prices of fuel and lighting in 1935 were about 26% less than the 1926 level. Gasoline prices in that year were about 35% less than the 1926 level. In 1936 fuel and lighting registered a level about 24% less than par, or less than 1926, while gasoline in that year was 31% less than the 1926 level.

Q. How does this situation compare with the situation in prior years?

A. From 1926 through 1930 the price of the fuel and lighting group and gasoline followed very closely. The two groups diverged in 1931, gasoline falling several points below fuel and li[illegible] From then on through 1936, the fuel and lighting group continued to improve more rapidly than gasoline did, until in 1936 there is indicated an increase in the fuel and lighting group of about twice that of gasoline.

Q. Again confining yourself to 1935 and 1936, will you state the situation in respect to tank wagon gasoline prices as compared to the prices of building material?

2879 A. In the year 1935 the level of prices of building materials stood at 85, or about 15% less than the 1926 level. Gasoline prices in that year stood at 65, indicating that the gasoline prices were 35% less than the 1926 level. In 1936, building materials were 13% less than the 1926 level, while gasoline prices were 31% less than the 1926 level.

Q. How does this situation compare with the situation in prior years?

A. For the entire period from 1926 through 1936 the price of gasoline was consistently below the level of building materials. The extent of the difference, however, was greater during 1934, 1935, and 1936 than in any previous year back to 1926, building material prices showing a much more rapid recovery than gasoline prices during the period from 1932 through 1936.

Q. Now state the situation respecting tank wagon gasoline price levels in relation to the 1926 price level and textile products price levels in relation to their 1926 price levels.

A. In 1935 textile products were about 28% less
than their 1926 price level. Gasoline for 1935 was
35% below its 1926 level. Textile products recov-
2880 ered slightly in 1936 and were only 28% less, while
gasoline was 31% less than in 1926.

Q. How does this situation compare with the situation in prior years?

A. Gasoline registered prices consistently below those of textile products from 1926 through 1936, with the exception of the year 1932 when gasoline prices stood at a level 32% less than 1926, while textile products had declined to about 45% less than the 1926 level. Textile products then recovered very rapidly during 1933 and 1934, while gasoline fluctuated downward during 1933 and slightly upward in 1934, textile products leveling off considerably in 1935 and 1936, but remaining above the gasoline level for those 2 years.

Q. Now, will you please state the situation respecting tank wagon prices of gasoline in comparison with price levels of house furnishing goods?

A. During 1935 the price of house furnishing goods was almost 20% below the level of 1926, while gasoline in that year was 35% below its 1926 level. In 1936 house furnishings were about 18% below the 1926 level while gasoline was about 31% below its level of 1926.

Q. How does this situation of 1935 and 1936 compare with prior years?

A. The price of gasoline was consistently lower than the prices of house furnishing goods for the 2881 entire period from 1926 through 1936. The price of house furnishing goods declined consistently through the 1926-1932 period, then increased slightly in 1933 and 1934, at which level the trend held fairly well through 1935 and 1936. Gasoline in relation dropped rapidly through 1931, recovered slightly in 1932, but the recovery in house furnishing goods was more rapid from the year 1932 through 1936 than was the recovery in the price of gasoline.

Q. Have you also compared the retail prices of gasoline as reflected in Government statistics heretofore mentioned by you, with the prices of eggs, butter, milk, bread and flour?

A. I have.

Q. And was the same method of comparison employed in making this study as previously described by you?

A. It was.

Q. Was the price level of 1926 taken as par in this instance as in the instance of wholesale prices and tank wagon prices?

A. It was.

Q. And for the same reason?

A. Yes, sir.

Q. Will you state the situation with respect 2882 to gasoline and eggs for the years 1935 and 1936?

A. In 1935 the price of eggs was 25% below its 1926 level. Gasoline prices in that year were 35% below their 1926 level. In 1936 the price of eggs was

22% below the 1926 level, while gasoline prices were about 31% below their 1926 level.

Q. How does this situation compare with previous years?

A. The price of eggs, after falling below its 1926 level in 1927, rose sharply in 1928 and 1929, indicating a price slightly above par. A rapid decline then set in through the years of 1930, 1931, 1932 and 1933, until in the latter year it registered 46% below the 1926 level. Recovery during 1934 and 1935 was very rapid, the latter year indicating in comparison a level 25% below 1926. There was further improvement in 1936 to a level about 22% below par. Gasoline prices dropped sharply in 1927 where they leveled off at 16% below par and continued at practically the same rate through 1928 and 1929. Another rapid decline set in which carried the price downward through 1930 and in 1931 to a level of about 38% below 1926. All through this period gasoline prices were at lower levels than was the price of eggs. In its decline the price of eggs dropped below the price of gasoline in 1932, 1933 and 1934, when it passed above the price of gasoline, registering the levels I have heretofore stated in comparison with gasoline in 1935 and 1936. 2883

Q. Will you please state the situation in respect to butter and gasoline during 1935 and 1936?

A. In 1935 the price of butter was only slightly higher in relation to 1926 than was the price of gasoline, butter indicating a level about 23% below 1926, while gasoline was about 35% below its 1926 level. The price of butter rose more rapidly than the price of gasoline in 1936 until it reached a level about 25% below par, while gasoline in 1936 was about 31% below par.

Q. How did the situation in 1935 and 1936 compare with prior years?

A. The price of gasoline was consistently lower than the price of butter through 1927, 1928, 1929, 1930 and 1931. The trend of gasoline was almost consistently downward during that period except in 1927, 1928 and 1929 which years leveled off at about 15% below 1926, while butter rose sharply in 1927 and 1928 to a level about 6% above par. It declined slightly in 1929, and then began a very rapid decline through 1932, falling under gasoline in the latter years. It continued below the level of gasoline

2884 prices during 1933 and then rose sharply during 1934 and 1935, in which year it registered a level above that of gasoline and indicated the relationship previously referred to for the year 1936.

Q. State the situation in respect to retail prices of gasoline as compared with the retail prices of milk during 1935 and 1936?

A. In 1935 the retail prices of milk were about 16% below the 1926 price. The price of milk in 1936 improved slightly to a level about 14% below 1926. Gasoline prices in 1935 were about 35% below the 1926 level and in 1936 were about 31% below the 1926 level.

Q. How did the situation in 1935 and 1936 compare with the situation in prior years?

A. The retail price of gasoline was consistently lower than the retail price of milk during the entire period. As was indicated in the previous comparisons, the price of gasoline dropped sharply from 1926 through 1931, except for a leveling off period in 1927, 1928 and 1929, while the price of milk was consistently above par during the years 1927, 1928 and 1929, and above par in 1930. Milk prices then declined rapidly during 1931 and 1932 and slightly in 1933, when they reached a level about 24% below the 1926 level. The price of milk then recovered
2885 quite rapidly in 1934 and 1935 and continued upward in 1936, the improvement in the price of milk being much more rapid in the 1933-1936 period than was the recovery in the price of gasoline.

Q. Now state the situation in respect to retail prices of gasoline and the retail prices of bread during 1935 and 1936?

A. In 1935 the retail prices of bread were only 11% below the 1926 level, while gasoline prices were 35% below the 1926 level. In 1936 bread prices fell off slightly to a level about 18% below 1926. Gasoline prices during that year were about 31% below their 1926 level. Again we find that gasoline was consistently below the price of bread through the entire period. The significant fact about this comparison is that bread recovered very rapidly during 1932-1935 period, while gasoline prices during the same period increased more slowly. Bread improved its position during 1932-1935 period by almost 20 points, while the price of gasoline increased only 4 or 5 points.

Q. Please state the situation in respect to retail prices of gasoline and retail prices of flour during 1935 and 1936.

A. The retail price of flour during 1935 was about 15% below its 1926 level. Gasoline was 35% below its 1926 level. In 1936 the price of flour was 20% 2886 below its 1926 level, while gasoline was 31% below its 1926 price. The significant thing indicated in this comparison is that the price of flour increased very rapidly in 1933, 1934, and 1935, improving its position to the extent of almost 33 points, while gasoline during the 1932-1935 period increased only 4 or 5 points.

Mr. Chaffetz: I object to the offer of proof.

The Court: Objection sustained; exception allowed.

(The following proceedings were had in the presence of the jury.)

In my study of statistics dealing with the petroleum industry, I have considered the wages paid to workmen in the industry. I have confined it to petroleum refining and petroleum producing, because there are no figures available for marketing or in connection with pipe lines. I went to the United States Department of Labor statistics in making that study and I studied the period from November, 1932 through 1936.

Cross-Examination by Mr. Chaffetz.

The Bureau of Mines recommends increases or decreases in gasoline stocks. I would have to look at their reports to tell by what amounts the actual storage stocks of gasoline in February and March, 1936 exceeded the amounts of storage stocks that were recommended for those two months by the Bureau of Mines. I do not 2887 know how much they recommended for February and March, 1936. I have the records, no doubt, in my office. I do not have them here with me. They did not recommend 66,000,000 for March 31, 1936. The Bureau of Mines did recommend 66,130,000 barrels of gasoline, finished and unfinished, at the end of March, 1935.

I do not think the Bureau of Mines recommended in 1936 a comparable figure to the 66,130,000 which they recommended in March, 1935. They did, however, recommend an increase or decrease in gasoline stocks for each month from then on, but without recommending a total economic or minimum requirement. The boys at the Bureau of Mines did not set up, to my knowledge, economic or minimum requirements for the end of March, 1936. In my conversations with them they have told me that they did not have any recommended minimum levels beyond March, 1935, with the possible exception of September. 1935.

Outside of court a few moments ago a published forecast of the Bureau of Mines for January, 1936 was shown to me. 66,500,000 barrels of gasoline to be in storage at the end of March, 1936, is what the Bureau thought the economic level should be. There were approximately 74,485,000 barrels of finished and unfinished gasoline actually in storage at the end of March, 1936.

There was an excess of seasonal gasoline in February and March, 1936, in storage, but not the excess that is
2888 indicated between the Bureau's figures of 66,500,000 and the 74,000,000. My opinion differs with the Bureau's very decidedly but I do agree that there was some excess. I would say it was about 4,000,000, between 3,500,000 to 4,000,000 barrels. According to the Bureau of Mines' figures, the excess was 8,000,000 barrels.

That excess was built up starting with February, 1936. At the end of January, 1936, there were 62,754,000 barrels of finished and unfinished gasoline in storage. That was slightly higher than economic seasonal levels required.

Then in February that level increased considerably, about 9,000,000 barrels.

Part of it was because of the very disappointing demand in February, a demand which for the first time in several months fell below the anticipated demand of the Bureau of Mines, and in that month we began to build up this surplus that I am talking about.

When I talk about some increase over economic levels in January, I mean in my opinion.

I didn't know what the level was that was recommended by the Bureau of Mines for the end of January. 1936. I don't know the figure that they recommended, but I can say that the figure that they recommended for the end of March was considerably lower than I thought the industry ought to have at that time.

2889 These figures are relative, and I think I could make that explanation more complete by going back to the end of March, 1935.

To my knowledge, without looking up the figures, I would say in a general way that this excess storage was probably evenly distributed. However, the various companies' figures indicate that very clearly. I don't have the various companies' figures.

I wouldn't say that that storage was virtually all in the hands of the major companies without looking it up. I would say that it was in the hands of any company, major or minor, using the two terms that way, who carried seasonal inventories. It isn't only the major companies that carried seasonal inventories. Any seasonal operator like Skelly or Kanotex, any of that type, carried seasonal inventories, and many small operators who didn't have the capacity to run to their peak seasonal demand. I would have to look up the companies in the Mid-Continent field who are not major companies, who made seasonal storage stocks. I can't recall them.

Direct Examination by Mr. Donovan.

I have prepared a tabulation showing the refineries' capacity owned by defendants and affiliated companies in
the entire United States, as of January, 1, 1935, and
2890 January 1, 1936. The source of my information in
this tabulation was the refinery and cracking plant capacity information circulars of the United States Bureau of Mines. My tabulation also shows total operating capacity as of January 1, 1935, and January 1, 1936, in the entire United States.

I have calculated what percentage of the total operating refining capacity in the United States was owned by these defendants and by their subsidiaries and affiliates. I have done that both for cracking capacity and straight run.

(Tabulation referred to is received in evidence as EXHIBIT 1016.)

Exhibit 1016 for identification is the tabulation I have prepared. I have done it accurately in accordance with the information I testified was the source of the material here.

No Cross-Examination.

(Witness excused.)

Mr. Chaffetz: With the permission of the defense counsel, I should like the record to show that it is stipulated that if Mr. Van Covern was recalled for further examination, he would give the testimony covered by Exhibit 1027 for identification, and that that Exhibit and Exhibit 1028 are offered in evidence.

2891 The Court: They may be received.

(Documents referred to are received in evidence as EXHIBITS 1027 and 1028 respectively.)

(Stipulations were offered by Mr. Donovan, and received in evidence as EXHIBITS 961 to 966, inclusive.)

2892 LESLIE M. WOODWARD, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Wichita, Kansas. I have been since 1930 assistant secretary of Derby Oil Company, an independent refiner, located at Wichita, Kansas.

From 1934 through 1936, I was in charge of and familiar with the company's books and records showing the production and sales of gasoline.

During 1934, 1935 and 1936 the company sold its gasoline in Kansas, Nebraska, Eastern Colorado, Southwestern Iowa, and Kansas City and St. Jo., Missouri.

During those years our company sold very little, if any, gasoline to major companies. 1930 was the only year we sold any appreciable amount to major companies.

The total gasoline production of our company was: 1934, 40,022,572 gallons; 1935, 45,008,762 gallons; 1936, 45,663,945 gallons. The total sales in gallons were: 1934, 40,906,625 gallons; 1935, 45,254,115 gallons; 1936, 46,385,930 gallons.

These sales figures include outside purchases of finished gasoline which was resold by the company. To get the total refinery sales you would have to deduct the outside purchases. I set up those figures so that I could make that deduction. The amount of outside purchases that I deducted for each of those years was: in 1934, 223,694
2893 gallons; in 1935, 1,216,746 gallons; and in 1936,
611,096 gallons. In order to get the actual refinery sales of the company for those three years I would have to subtract those amounts I have just mentioned from the total sales for each of those respective years.

I have prepared a schedule accurately setting forth these various figures that I mentioned, and also giving the monthly breakdown for those three years of our gasoline production and our gasoline sales. I have that schedule with me.

(Tabulation referred to is received in evidence as EXHIBIT 960.)

Cross-Examination by Mr. Lewin.

I haven't any definite knowledge of whether our company in 1935 and 1936 sold gasoline on the spot market. I believe not. Our sales were contract, but I cannot say definitely. I know of no spot sales.

During 1935 and 1936 we sold in Missouri, Iowa, and Kansas. Those are the only three states in the Standard of Indiana territory in which I know we sold. We had a service station in Kansas City, and in Des Moines and Shenandoah in Iowa. They are the only stations that we had. We did not sell a great deal from them. We did not sell very much directly to consumers in those states.

2894 Q. Most of the gasoline that you sell in those states you sell to jobbers under contracts?

A. No, we only had one jobber in Missouri outside of our own station at Kansas City, and that is at St. Jo. We have none in Iowa.

Q. Do you sell more to that jobber in Missouri than you sell through your own stations in Missouri?

A. I do not know. I do not think so. We have no jobber customers in Iowa. We have jobber customers in Kansas. I could not give you the figures on that nor the approximate number. As to how it compares with our sales in Missouri to jobbers, Kansas and Nebraska will take the bulk of our sales.

2895 C. A. CARLSON, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is Cushing, Oklahoma. I have been employed for over 11 years by Cushing Refining and Gasoline Company, an independent refiner located at Cushing, Oklahoma, and with a sales office at Minneapolis, Minnesota. I am employed in the capacity of accountant.

In 1934, 84.02% of our total gasoline sales were to jobbers and brokers in the Mid-Western area; in 1935, 89.62%; and in 1936, 86.24%.

During these same years, the company sold some gasoline to major companies. It sold a greater per cent of its gasoline to major companies in 1934 than it did to major companies in 1935. The total per cent of sales to major companies in 1934 was 15.98%; in 1935, 10.38%; in 1936, 13.26%. It would appear that during those years the company sold a greater portion of its gasoline to jobbers and brokers.

Nearly all of the sales to jobbers and brokers were on the spot market, as we only have 4 or 5 customers on contracts. That was true for all 3 years.

I have prepared a tabulation from records I kept, showing the production of gasoline and gasoline sales, by months, during those 3 years. The total gasoline
2896 production of the company for 1934 was 494,826 barrels; for 1935, 803,471 barrels; and for 1936, 842,743 barrels. The total gasoline sales for 1934 were 513,320 barrels; for 1935, 798,501 barrels; and for 1936, 836,979 barrels.

The tabulation which I have prepared accurately reflects and breaks down these yearly figures into months, both in production and in sales. It also shows the percentage of its sales to majors and to jobbers and brokers during those years.

(Tabulation referred to is received in evidence as EXHIBIT 887.)

Cross-Examination by Mr. Lewin.

We maintain or operate a skimming plant at Blackwell, Oklahoma, and a skimming plant and a cracking unit at Cushing, Oklahoma. The total daily crude capacity of our refinery at Blackwell is 1700 barrels, and at Cushing, 4200 barrels.

I could not say why our production of gasoline declined from 76,492 barrels in November, 1935 to 58,379 in December, 1935, and to 60,398 in January, 1936. These sales in 1934 that I spoke of were made to White Eagle; Socony-Vacuum; Sinclair Refining Company; Skelly Oil; Phillips Petroleum; Mid-Continent Petroleum; Tide Water; Lubrite; Wadhams; and Shell Pipe Line Com-

pany. It might be Shell Pipe Line or Shell Pe-
2897 troleum. Less than 1% of sales delivered during 1934 were made to Shell Petroleum, approximately 5% of all the sales to major companies and approximately 50 tank cars. Approximately 175 tank cars were sold to Shell Petroleum Corporation in the period from March 1, 1935 through the end of 1935. There were no sales to Shell Petroleum or Shell Pipe Line in January and February, 1935.

Q. Then, I understand your testimony that in 1934 throughout that entire year 50 cars were sold to Shell, and in January and February, 1935, no cars were sold to Shell, and then the period from March 1, 1935, through the rest of that year 175 cars were sold to Shell, is that right? And tell us how many cars were sold to Shell in 1936?

A. My figures are incomplete on that—that is, for lack of totals—(witness computing)—about 410 tank cars.

Redirect Examination by Mr. Donovan.

I have made a tabulation of gasoline sales to majors in 1934, 1935, and the first 6 months of 1936. In 1934, our total sales to major companies were 72,044 barrels; and in 1935, 82,913 barrels. So that was about the same in both years. The total per cent of sales to major companies for the year 1934 as to total sales was 15.98%.

(Tabulation referred to received in evidence as EXHIBIT 888.)

2898 JAMES D. MILLER, a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

I reside at Bronxville, New York. I am a certified public accountant, licensed under the laws of New York, and a member of W. F. Weiss and Company, New York, a firm of certified public accountants. They have been in the public practice of accountancy about 40 years. I have been connected with them for over 16 years. During that time I have been continuously engaged in the practice of public accounting. We have been retained by the defendants in this case.

We made an audit of the books and records of Danciger Oil and Refineries, Inc. It is known in the industry as an independent refiner. The records by which we made this audit are presently available. The program of audit was laid out by me. In the later stages of the field work I actively supervised it, personally supervising all the checking and the tabulation of stocks.

This audit shows all the spot open market sales made by Danciger to independent refiners, to brokers, to jobbers and to consumers, for a period of 21 months, that is, from November 1, 1934 to July 31, 1936.

2899 I have completed a comparison of the prices at which Danciger made sales to jobbers and consumers at flat prices from November 1, 1934 to December 31, 1935 with the daily range of prices quoted by Platt's Oilgram for the Oklahoma refinery market, and by the Chicago Journal of Commerce.

I can tell from my comparison how many of those prices were above the high quotations quoted by the trade papers, at the highest of both papers, or at the composite high, within the range of the trade paper quotations, and below the composite low.

During that 14 month period there was a total of 538 sales, made at flat prices to jobbers and consumers, of third grade gasoline in tank car lots. Those were sales that were made on a Group 3 basis. Of those transactions 84 were made above the high, 47 at the composite high, 24 within the range of the high and low, 294 at the low, and 89 below the low.

During the first 4 months of this period, the period before the price rise, that is, from November 1, 1934 to March 1, 1935, there were 118 sales transactions of this type, and of these, 7 were made above the high, 12 at the high, 10 within the range, 53 at the low, and 36 below the low. These were sales to jobbers and consumers—very few to consumers, most of them to jobbers. None were to major companies, none to other refiners, and none 2900 to brokers. So we are dealing now only with sales to jobbers and consumers.

These are all open spot market sales for prompt delivery, and at flat prices. By "prompt delivery" I mean within 15 days. There were no jobber and consumer sales for delivery within 30 days.

During the 3 months when the market was rising there were 134 sales transactions of this type. The period of the price rise is March, April and May, 1935. There were 11 made above the high, 20 at the high, 10 within the range, 76 at the low, and 17 below the low. There were more above the high in this period than there were in the preceding period, and less below the low than in the preceding period. That would be true of jobbers alone.

During the 3 months starting with March when the market was rising, the number of flat price sales to jobbers increased over the number of such sales to jobbers in the 4 months before the time the market was rising; it increased during the rising period.

Likewise I have made an audit of the sales of gasoline made by Danciger to the major companies who are defendants in this case, for the calendar year 1935. I made that audit from the books and records of these defendant major companies which were subpoenaed by the Government in this case and from the Danciger records.

I have prepared a chart showing the flat price
2901 sales on a Group 3 basis of third grade and regular
grade made by Danciger to jobbers and consumers and to those major company defendants. The chart was made by us under my supervision and direction. It correctly records the audit to which I have referred. This chart compares jobber, consumer, and major company sales, which I have mentioned, with the prices published from day to day in Platt's Oilgram, Oklahoma refinery market, and the Chicago Journal of Commerce.

(Chart referred to marked Exhibit 868 for identification.)

The black dots are sales to jobbers of third-grade gasoline. The green dots are sales to jobbers of regular grade gasoline. The blue dots are sales to consumers of third grade. There are not many of those, and they are all third-grade. The red dots are sales to majors of third-grade.

The first red dot is in January, 1935. No more appear on the chart until we come to April, 1935.

Occasionally there was more than one sale on the same date at the same price. The number under a dot indicates the number of sales transactions, in the event there was more than one at the same price on the same date. If there is a number "4" or "2", that would mean there were 4 or 2 flat price sales made on that particular day to that particular type of customer.

On this chart on April 15, 1935, I find on the
2902 4⅜¢ line a red dot with a black dot beside it. That
red dot represents a sale to a major company. The black dot represents a sale to a jobber. On the same day, there is another black dot which represents a sale to a

jobber at a price of 4½¢; that is above the first black dot on the chart. There is also a black dot representing a sale to a jobber at a price of 4¼¢ that is right below it. That means that on April 15, Danciger made a spot sale of third-grade gasoline to one jobber at 4¼¢ and that that was the price equal to the low of the Chicago Journal of Commerce on that day; they made another sale of third-grade gasoline to a jobber at a price of 4⅜¢ and that was equal to the low of Platt's Oilgram on that day; there was still a third flat price sale to a jobber at 4½¢, and that was equal to the high of both Oilgram and Journal of Commerce on that day, and on the same day Danciger made a sale to a major at a price half way between the prices at which it was, on that day, also selling to jobbers. Half way between and also at the same price. There was a sale in the middle there to a jobber, also.

Prior to April 15, when Danciger sold third-grade gasoline to a major company at 4⅜¢, it already had sold third-grade gasoline to jobbers at that price. It had made 2 sales, 1 here on April 5, and then there is 1 on April 13.

2903 Prior to April 15, when Danciger sold third-grade gasoline to a major company at 4⅜¢, it had sold third-grade gasoline to jobbers at even higher prices than 4⅜¢. It had made several sales at 4½¢. The first sale is on April 6. And then there is another sale on April 11. Another on April 12. All 3 of those were at 4½¢.

Mr. Lewin: May I ask whether or not the witness took into consideration the particular specifications of gasoline and whether the specifications were guaranteed?

A. They don't guarantee octane on third grade. We are dealing here with third-grade, but I can assure you that we examined all this carefully to make sure that it was third-grade.

Between March 1, 1935 and April 14, 1935 Danciger made 2 sales to major companies. They made 1 in April of 2 cars on a publication basis. It was not made on a flat price basis. That will not be reflected on this chart, because this chart deals only with flat price sales. There was still another for 7 cars which happened to have been made on an f. o. b. refinery basis. This chart deals with flat price sales on Group 3 basis. The refinery, out of which that material was shipped, is located in the Panhandle. Therefore f. o. b. refinery would not be f. o. b. Oklahoma, or f. o. b. Group 3.

On April 23 Danciger made 1 sale of third grade gaso-

line to a major company at 4½¢. That price was
2904 equal to the low of the published market on that day
of both publications, Oilgram and Journal of Commerce. The low of this published market had been 4½¢ for 3 days before in both trade journals.

Before Danciger had made this sale of third grade gasoline to a major company at 4½¢ on April 23, it had already made 5 sales to jobbers in the spot market, at that same price, and 5 sales to jobbers in the spot market at ⅛¢ to ¼¢ above that price.

When I refer to major companies I mean present defendant major companies. During 1935 Danciger made some sales of third grade gasoline to major companies at prices below the published spot market quotations. On May 8, there were 2 sales on the same day, at the same price, to majors, at ⅛¢ below the low of both publications.

At no time during 1935 did Danciger make any sales to the defendant major companies at a price higher than the trade paper quotations. During 1935 Danciger made some sales of third grade gasoline to defendant major companies at a price equal to the high of the published spot market. There is one on June 7th; and another on June 18th; and another on July 2d.

Generally it is true that during the greater part of 1935 the prices which defendant major companies were paying to Danciger were at or below the levels at which
2905 Danciger was selling to jobbers.

These dots on this chart do not represent all of the spot sales made by Danciger between November 1, 1934 and the end of 1935. This is just a small part of them. Among those not shown on the chart you would have spot sales to refiners; you would have spot sales to brokers; you would have sales on a publication basis to jobbers and to consumers; you would have flat price sales to jobbers and consumers on an f. o. b. refinery basis; you would have sales of intermediate bracket and premium gasoline. And by premium gasoline I mean gasoline that would rank higher than regular grade. I haven't shown those spot sales because they are not comparable to these published prices. We have included here every spot market transaction that is comparable with these published prices.

I got my information as to the volume of sales from the Danciger records, the same place I obtained all of this.

There was a very substantial increase in the amount of gasoline bought from Danciger by brokers in March,

1935. There was over a million gallons sold in March, 1935 to brokers. Brokers never bought that much from Danciger in any other month out of the 21 months that we examined. And in March, 1935, that represented about 20% of Danciger's total sales, whereas, over
2906 the 21 month period Danciger did not sell more than
about 6% of its gasoline to brokers. I know who the brokers were.

During the calendar year 1935 Danciger made about 3% of their total sales to majors and 97% to all other types of customers. We don't know who those brokers were buying for. We know the destination of the shipments sometimes, but sometimes the shipments were rerouted, while the car was rolling, so we don't always know to whom that material was ultimately destined.

If all of Danciger's contract sales were eliminated, the percentage of defendant major purchases of all types from Danciger, as compared to Danciger non-contract sales to others, would be less than 4%.

During 1935 seven different defendant major companies bought gasoline from Danciger. The aggregate for all defendant major companies for the year 1935 was 195 cars. But there was no uniformity as between majors. It varied from 1 car up to 92 cars in volume.

Some of these majors purchased exclusively on the flat price basis. Others purchased exclusively on a publication basis. There was no uniformity whatever in the method of purchasing. Those purchasing exclusively at a flat price were Barnsdall, Mid-Continent, Shell and Skelly. Those purchasing exclusively on a publication basis were Empire and the White Eagle Division of Socony-Vacuum. Phillips, Wadhams, and the Lubrite Division of Socony-Vacuum purchased on both bases; that is, on a flat
2907 price basis and on a publication basis.

As to those that purchased at a flat price basis, some purchased at a flat price on an f. o. b. Group 3 basis, and others on an f. o. b. refinery basis. I might illustrate that: The purchases that Phillips made at a flat price were made on the basis of f. o. b. refinery; and those purchases made by Wadhams at a flat price were made on the basis of f. o. b. Group 3. Now, Lubrite purchased at a flat price, but both on a basis of f. o. b. Group 3 and f. o. b. refinery.

I might say that practically all of this material came out of the Pampa refinery of the Danciger Company, which is located in the Panhandle. On shipments moving north, there would be a differential in freight between Group 3, which is Oklahoma, and Pampa, Texas. So there would be some variation in price to take into consideration, the freight differential, whether the purchase was made on an f. o. b. Group 3 basis or f. o. b. refinery basis. But there was no uniformity by these majors as to how they bought, as to whether it was f. o. b. Group 3 or f. o. b. refinery.

Assuming that we are talking about a northern shipment, the lower price would be the f. o. b. refinery price because the purchaser would have to pay more freight.

As to the purchases made on a publication basis, there was no uniformity in that regard either. Phillips
2908 and Socony-Vacuum bought on the basis of the Chicago Journal of Commerce. That is, it would be a certain price, or a certain relationship to the price as published in the Chicago Journal of Commerce on the date of shipment. The Empire, for instance, bought on the basis of Platt's Oilgram, and Platt's Oilgram for the North Texas refinery market. Phillips bought on the basis of Chicago Journal of Commerce, Group 3; and they bought at the low on the date of shipment. Lubrite bought at ⅛¢ under the low, and Wadhams bought both at the low and ⅛¢ under the low. The White Eagle Division split an order for 50 cars, placing one-half at the low, and one-half at ⅛¢ under the low.

Now, the specifications on the material varied, too. For instance, Lubrite's orders always specified 60 to 62 gravity, 400 endpoint, except for 1 purchase in January, 1935 that called for a 62 octane guarantee. These 3 purchases there by Wadhams—there was one on June 7th, another on June 18th, another on July 2d. Those were the ones that were purchased at the high of the published quotations, and those called for a 62 octane guarantee.

I can give you also the volume of purchases by months. There was a great deal of fluctuation in that, too. For instance, there was one month, the month of December, in which there were no purchases by a major at all.
2909 Then there were two months, February and October, when there was only 1 car purchased in each month. There were two months, January and August, when there were only 2 cars purchased in a month. There was one month, September, when there were 3 cars purchased. There was one month, March, when there were 7 cars purchased. There was another month, April, when there were 8 cars purchased. There was another month, July, when there were 15 cars purchased. There was one month, December, when there were 50 cars purchased. Then there were two months, May and June, when there were 53 cars purchased in each month.

By Mr. Francis

During those months when this price was advancing, March, April and May, 1935, beginning March 1st, there isn't any red dot that is above the low of either publication, except this one here, on April 15th. That is above the low of one publication, but at the low of another publication. There is no time during the price rise that there is a purchase by a major company at above the low of both publications.

Cross-Examination by Mr. Chaffetz.

If you took off only the purchases by the major companies that appear on this chart, and drew a graph of those major company prices, you wouldn't have a graph that 2910 would reflect exactly the same trend of prices as published in the Chicago Journal of Commerce. You would have something radically different. As to the respects in which the two graphs would differ, to begin with, you would have no graphs at all during March and the first half of April since there were no purchases.

In running a line from one major purchase to another you would get considerable variation. From April 15th, your line would run on up to here on the 23rd; whereas that doesn't follow either publication.

Both prices were the same as the low of the Journal of Commerce on those days. But, you see, there were days when there were no purchases.

If you come over to the period when the line is level, then except for the 3 special purchases that I referred to, that were made above the low, all of the purchases were made at the low throughout that year except for one day. On that day it would be the low of Platt's Oilgram, but it would be the average of the Chicago Journal of Commerce, and it would be above the low of the Journal.

I am not an employee of the Danciger Company. But I know of their contract relations with certain customers. I do not know anything about the relations of Danciger with customers who are not contract customers. With regard to independent refiners who have special relationships 2911 with particular jobbers or brokers, that may not be in the form of contracts, but which have an effect as though they were written, I will say this: We made a lot of audits of a lot of independent refiners, and we always informed ourselves of any agreement that they had with their customers, whether it was a formal contract or whether it was an agreement of a different sort. We always knew of any such relationship existing between the company and its customers.

Now, the customers that Danciger has under contract, they are not the formal contracts of the type that you have been discussing in this case before. They are in writing, but they are not that type.

Q. I am leaving contracts out. I had in mind a situation like this, where an independent refiner sells to a particular jobber and has been over a period of time, and has customarily been selling to that jobber for ⅛¢ or 1/16¢ below the market; no contract, nothing binding upon either side, but the usual custom had developed over a period of time.

A. We would know about that, because we examine all the purchase orders. We examined every purchase order, covering every sale made to a jobber throughout this whole 21-month period. And if there was any such arrangement, we would know
2912 about it.

Q. Did you ever run into any such arrangement with any of the independent refiners that you have examined?

A. Yes, we did.

Q. And did you exclude all such purchases or sales?

A. We excluded them as being on a publication basis, yes. When you say exclude, we would exclude them in comparing them with published prices, because they would not be comparable. In the first place, you couldn't compare them because you don't know what is the price on the date of purchase.

Q. No, I am not sure you understand me yet. I am not talking about a sale made on the basis of ⅛¢ below the Journal. I am talking about a sale made at a flat price, but where the parties among themselves understand that the flat price that will be quoted by the independent refiner to this particular jobber will be ⅛¢ below—I am assuming a situation where there is nothing in writing to show that.

A. I will answer you—

Q. I have in mind the specific thing Mr. Shatford spoke about when he referred to special relation-
2913 ships that sometimes exist between independent refiners and particular customers.

A. We always examine the purchase price for consistency with the publications; and if we found any consistency, we went to the sales department, the head of the sales department, and asked him whether any such relationship might exist; so we always attempted to run those down.

Q. And where you did run them down, you excluded them as not being sales on the spot market at flat prices?

A. We found that there was an agreement, and that those customers were to be classified as contract customers; and those sales were contract sales, as distinguished from spot sales.

I was here for I think the first two hours of the first day when Mr. Jacobi was testifying. I don't remember his testifying that he had a relationship of some sort with Danciger whereby he had, prior to March of 1935, purchased at ⅛¢ below the low, and that he continued to purchase on that basis in view of that prior relationship. I don't know whether that was the fact. What purchases were made by Socony-Vacuum, or any division, or a subsidiary of Socony-Vacuum prior to 1935, we didn't go into.

We did take all the purchases made by Socony-
2914 Vacuum or any division or department from January
1, 1935, on, and we found no such thing.

I didn't say there were no instances of guaranteed specifications of third grade gasoline. There are a few. Just as I pointed out there (indicating), there are 3 of Wadhams. You did ask me about this one on April 15th; and that does happen to be a little unusual. The specifications on that are 60-62 gravity, 400 endpoint, which very often commands a premium of ⅛¢ over ordinary third grade gasoline. That was bought by Barnsdall.

Q. So that you have covered some instances of guaranteed octane, or guaranteed specifications in your third grade gasoline?

A. We have included everything that we felt belonged in third grade material. Now as a matter of fact, there are a lot of sales made by Danciger, which were made as third grade, which we have not included in here, which were made at even higher prices; because we found, by looking at the distillation report, that the material ran 63 and 64 octane. But the customer ordered third grade, it was shipped as third grade, and they were billed for it as third grade; but the distillation test showed 63 or 64 octane, and we leaned over backwards and left those out, and they are all higher priced sales. And the same is true
2915 with regular grade. Those are all sales to jobbers.

> Now, on regular grade, this Danciger Company has a plant at Columbia, that turns out a premium gasoline which runs from 70 to 74 octane. At times, they filled orders for jobbers for regular gasoline out of that plant and it was sold as regular grade, but the octane test would show it was a quality gasoline, and we left all of those out. Those were all sold at high prices.

All the 63-70 we show on there is non-leaded gasoline. The precise octane rating of that gasoline was 68 to 70. With every invoice there is a distillation report which shows the octane rating. If there was anything marked 70 plus, we excluded it.

On May 8, 1935, where I show transactions below the low of both journals in sales to major companies, both those sales were made to Wadhams at 4½¢. One of them was for 3 cars, and the other was for 10 cars. There are 2 sales transactions. They were not guaranteed specification materials, but were ordinary third-grade material. Except for those sales, I don't know whether all sales to Wadhams called for guaranteed specification material.

(Chart previously so marked for identification is received in evidence as EXHIBIT 868.)

2916 *Direct Examination (Continued) by Mr. Donovan.*

I have had made under my supervision an audit of the purchases made by Mid-Continent Petroleum Corporation from independent refiners and brokers in 1935. The audit was made for the purpose of ascertaining the prices paid as compared with trade publication quotations for similar grades of gasoline. In making this audit we had the purchase orders issued by Mid-Continent, their shipping instructions, the suppliers' invoices and the suppliers' sales confirmations, if there were any.

During the period from March 1, 1935 to the end of May, 1935, the tank car prices as shown in the trade publications were rising. From my examination and the comparison that I made, I found that the prices paid by Mid-Continent for purchases from independent refiners and brokers followed this rise consistently. The Mid-Continent purchase prices were always lagging behind the rise.

The prices paid by Mid-Continent on the majority of the purchases during the balance of 1935 were below the low of the Platt's Oilgram quotations, but as the market steadied there were more purchases made at the low than there were during the period of the rise.

2917 I have prepared charts for 1935 illustrating the facts concerning which I have just testified.

(Chart referred to below is marked as Exhibit 869 for identification.)

This chart, which was prepared at my direction and under my supervision, covers the whole year 1935. It contains on here all the spot open market purchases from independent refiners and brokers made by Mid-Continent Petroleum Corporation during the year 1935. They are all on an f. o. b. Group 3 basis, and are all made at a flat price. It shows the price paid on those purchases in relation to the published quotations, as they appeared in the Chicago Journal of Commerce and also Platt's Oilgram for the Oklahoma refinery market. This chart accurately shows those prices.

Each of the horizontal lines across the chart represents ⅛¢ a gallon. The amount of the eighths is shown here on the margin. The heavy line is 1¢. Everything colored in red is Platt's Oilgram. All the hatched lines represent the Chicago Journal of Commerce.

I might explain that the Journal quotes on an f. o. b. Group 3 basis, but the Oilgram quotes on many different bases, many different local markets. It quotes an f. o. b. refinery market and also f. o. b. Oklahoma; but this is Platt's Oilgram for the Oklahoma refinery market, which is the nearest thing you could get to compare with the Chicago Journal of Commerce, f. o. b. Group 3.

2918 This chart represents the quotations appearing in the two trade publications. They purport to represent the going market at which brokers and refiners, both independents and majors, sell on the spot market to jobbers and consumers.

There is a top line and a bottom line on the chart. The top line represents the top of the range as quoted in the publications. For instance, on April 1, 1935, the range as quoted in the Chicago Journal of Commerce for third grade was a high of 4⅜¢ and a low of 4⅛¢. In other words, there is a range there of ¼¢ between the high and the low. In Platt's Oilgram, there is a narrower range. The high for the Oilgram on April 1st for third grade is 4¼¢, as compared with 4⅜¢ in the Journal; and the low for the Oilgram is in agreement with the Journal, and that is 4⅛¢.

Every one of the black dots on that chart represents purchases by Mid-Continent in a spot, open market transaction. The dots are plotted on the chart on the date the purchase was made. All those purchases were made at a flat price, so that we are able to show the price that was agreed to be paid by Mid-Continent from an independent refiner or from a broker on the date that the order was consummated.

The space between every one of these vertical lines represents a day. We plot that on the date on which the order was made, the date the order was entered
2919 into; and we plot it on the line corresponding with the price that was paid. Take, for instance, the first one here (indicating). This is plotted on the line, 3¾¢, and that was the third grade material bought on that particular date by the Mid-Continent, from either a broker or an independent refiner, at that price.

The small numbers indicate, not the number of cars purchased, but the number of purchases, and that might include 1 car or 10 cars. There are some dates here when there was more than one purchase made at the same price (indicating), so we put a number under the dots indicating how many purchases were made on that particular date at the same price.

There are 112 purchases shown on this 1935 chart, 73 of them being below the low of the market as shown by Platt's Oilgram. A little over 65% of the total number of purchases were made below the low of the Oilgram. 37 of these 112 purchases were at the low of the Oilgram. That is a little over 33%. Just 2 were above the low of the Oilgram. That is less than 2%.

I have made a similar study or summary of the number of purchases at, above, or below the low of the Chicago Journal of Commerce in 1935. The number purchased below the low of the Journal was 67, which is about 60% of the total. There were 40 in number at the low, which is about 36%. There were 3 above the low, but
2920 below the high, which is less than 3%. The percentages below the low in connection with the Journal are slightly lower than those as compared with the Oilgram.

Those that were above the high were 2 in number, which is less than 2%.

Mr. Donovan: Q. Let me ask you the same question about these purchases by Mid-Continent that Mr. Chaffetz asked you yesterday about major company purchases from Danciger, and that is this. It appears at 1546 of the record; he said:

> "Mr. Miller, if you took off only the purchases by the major companies that appear on this chart, and drew a graph of those prices, I ask you whether you wouldn't have a graph that would reflect exactly the same trend of prices as published in the Chicago Journal of Commerce?"

Now, I ask you that question that he asked you.

A. Well, during the period of the rise in price you wouldn't be able to show any range at all, because the line would go out below the range of both publications, consistently below it (indicating), and you would have generally just a single line; you wouldn't have a high and a low; you would 2921 just have a single line up through here (indicating), below these price ranges, during this period of the market rise in March and April.

Now, when you get over here into May (indicating) even here you would have largely a single line. You would have practically nothing in the way of a range. When you get over here, from here over (indicating) into June, when the price rise has been completed, and then the majority of the sales, or of the purchases, were made at 1/8¢ below the range of the publications; and therefore your line for the low would be about 1/8¢ below the low of both publications. Whereas, the high, if you were to construct a high there, you would find that it would be in agreement with the low of both publications. That is, from June on to the end of the year, that is the way it would run.

Of course, after you get beyond October, November and December, the number of transactions thins out and becomes somewhat irregular.

There would be fluctuations in the low of that range that I would draw during this period. There were a substantial number of purchases that were made even lower than 1/8¢ below the low of both publications: For instance, on June 21 one was bought at 3/8¢ below the 2922 low. On August 28th one was bought 3/8¢ below the low of both publications. Then there is another on September 27th. There is still another on October 10th; then of course, there are more of them, that are 1/4¢ below the low.

This chart does not show anything about the amount of gasoline purchased at, above, and below the low. It deals only with the number of transactions. It doesn't show volume. We have prepared a chart which shows the number of cars bought at, above, and below the low of the trade journal quotations. This chart is designed only to show the relation of the prices paid in the various purchase transactions. The other chart would show pretty much the same thing with respect to volume.

(Chart marked EXHIBIT 869 was received in evidence.)

(Another chart is marked 870 for identification.)

Exhibit 870 for identification takes into account the same purchases appearing on Exhibit 869, but limited to the period of the price rise, that is, March, April and May of 1935, and it is dealing with tank cars rather than the number of purchases. It shows more graphically the relationship of the purchase price, dealing in quantities, rather than the number of purchase transactions, a comparison of the price paid in relationship to Platt's 2923 Oilgram for the Oklahoma Refinery market.

During the 3 month period of the price rise, there were only 15 cars purchased at the low of Platt's Oilgram quotations. And that is slightly over 7% of the total purchases made in that period. The total number of cars bought in that period was 212; and 15 of those cars were bought during that period at the low. There were no cars bought during that period above the low of Platt's Oilgram. That chart shows accurately the facts that I have just described. The number of cars bought below the low is 197 cars out of the total of 212. That represents about 93% of the total.

(Chart previously so marked was received in evidence as EXHIBIT 870.)

I have made the same kind of a chart dealing with the Chicago Journal of Commerce.

(Chart marked Exhibit 871 for identification.)

This chart, Exhibit 871, was prepared under my direction and supervision, on the basis of the data which I secured from my office. The plan of this chart is the same as the one I have just described, Exhibit 870.

Now here we are dealing with just a portion of the year, that is, the period of the price rise in March, April and May. And we are dealing here with only 27 of those

112 purchases. But again we are dealing with the
2924 number of tank cars rather than transactions, the same as this other chart, Exhibit 870; but this makes a comparison with the quotations in the Chicago Journal of Commerce as distinguished from Platt's Oilgram.

The whole block, both red and blue, purports to show the entire number of cars, which is 212. This entire block here (indicating) represents the total, that is, 100%. These segments here (indicating) will total up to 100%. And the number of cars will total up to 212.

Those figures on the side are the number of cars. These 63 cars were purchased at the low of the Journal during that period. That is about 30%. Now, this figure here (indicating) is 149 cars. That represents the number out of a total of 212 that were purchased below the low of the Journal quotations; and that is about 70% of the total. There were no purchases above the low of the Journal during those 3 months.

I prepared other charts, showing the whole period of 1935, both of the Journal and Oilgram. They are similar to this except that they cover the entire year 1935; this chart covers only the period of the price rise in March, April and May, 1935.

(Chart marked Exhibit 872 for identification.)

Exhibit 872 is a chart similar to Exhibits 871 and 870. That is, it is dealing again with tank cars; whereas,
2925 Exhibit 869, the very first chart, was dealing with the number of purchase transactions. Exhibit 872 covers the entire year 1935, and shows a comparison of the purchase price with the quotations appearing in the Journal which is on an f. o. b. Group 3 basis.

To begin with, we are dealing here with a total of 691 cars. This column (indicating) on the right will add up to 691 cars. That is the total number of cars bought by Mid-Continent Petroleum Corporation from independent refiners and brokers, on a flat price basis during 1935. This chart shows that during the entire year 1935, out of 691 cars there were 50 that were bought at a price that was above the low of the Journal quotations prevailing at the time the purchases were made; and that represents a little over 7%. There is one here that I overlooked. There were 4 cars purchased above the low and above the high. That represents less than ½ of 1%. There were 310 cars that were purchased at the low; and that represents about 45% of the total purchased, in volume. And there were 327 cars purchased below the low, which is about 47% of the total, in number of cars. All of those purchases are on an f. o. b. Group 3 basis and all at a flat price.

On the chart I compared the purchases with the quotations of the trade journals. Those 4 cars that were above the low and above the high appear on June 5 at 5¢
2926 and August 21 at a price of 5⅛¢. I might say there are only 2 purchases, but they aggregate 4 cars.

(Charts marked, respectively, EXHIBITS 871 and 872 were received in evidence.)

I have made a similar chart of the percentage and number of cars bought at, above and below the low of Platt's Oilgram during the year 1935.

(Chart referred to marked Exhibit 873 for identification.)

This chart, marked Exhibit 873, is similar to the preceding chart, Exhibit 872. It is dealing in tank cars with all the purchases made at a flat price by Mid-Continent Petroleum Corporation during 1935, but unlike the other chart, this compares the purchase price with the quotations in Platt's Oilgram for the Oklahoma refinery market; whereas, the preceding chart made the comparison with quotations in the Chicago Journal of Commerce. We are still dealing here with 691 cars purchased in the year.

The white area shows those 4 cars that were purchased above the high of the price range as it appeared in Platt's Oilgram in the Oklahoma refinery market on the date of purchase. That is, again, about ½ of 1% of the total cars purchased during the year. The colored area, this block here (indicating), represents a total of 308 cars of the total of 691, and it is about 44.5% of the total. And those 308 cars were purchased at the low of Platt's Oilgram
2927 quotations on the date of purchase. Now, the lower segment here represents the 379 cars that were purchased during 1935 at a price below the low of Oilgram quotations as they appeared on the date of purchase for the Oklahoma refinery market. That lower block is about 55% of the total.

(Chart previously so marked for identification is received in evidence as EXHIBIT 873.)

Cross-Examination by Mr. Chaffetz.

There were only 10 cars bought in 1935 on a publication basis. That is, a total of 701 cars bought by Mid-Continent in 1935 from independent refiners and brokers, but out of the 701, 691 were bought at a flat price. I am not familiar with any Mid-Continent buying program, but I can tell you from whom everyone of these purchases was made, that is, from what refiner or what broker.

When I say, "Mid-Continent Petroleum Corporation," I am dealing with only one of the defendants in this case. The term "Mid-Continent" doesn't refer to the Mid-Continent field. It is the corporate name of Mid-Continent Petroleum Corporation.

Direct Examination by Mr. Donovan (Continued).

2928 I have caused to be examined records of the defendant major oil companies, showing purchases of third-grade gasoline made by them from independent refiners on a flat price basis during March, April, May and June, 1935. That study was made from the impounded records that were sent here pursuant to a subpoena, I presume, by the defendant major companies. These records are now in this building.

I noted which of these purchases were made on a flat price basis. I also noted which of those flat price purchases were made on a Group 3 basis, and Oklahoma refinery basis. I have done that for all companies but Sinclair. I haven't completed Sinclair yet. I can tell the price at which flat price purchases on a Group 3 basis or an Oklahoma refinery basis were made by these companies, except Sinclair, during the months of March, April, May and June, 1935.

There were 5 purchases made by the defendant companies at flat prices on a Group 3 basis or on an Oklahoma refinery basis between March 1 and March 8, 1935. The prices at which those purchases were made varied. On March 1 there was 1 purchase at 3¼¢. There was no further purchase then until March 5, at which time 1 was made at 3⅜¢. Then, on March 6, there were 2, both of them at 3½¢. And on March 7 there was 1 at 3½¢. Now, this is all third grade gasoline.

2929 On March 8 there were 2 purchases made, 1 at 3⅝¢, and 1 at 4¢. Phillips made the 1 at 3⅝¢, and Globe made the 1 at 4¢

There were 2 made on March 9, both of them at 3¾¢; 1 by Continental, and 1 by Phillips.

The 10th was Sunday. On March 11 there were 2 purchases; 1 at 3⅝¢, and 1 at 3¾¢. The 1 at the lower price was made by the White Eagle Division of Socony-Vacuum, and the 1 at the higher price, that is, at 3¾¢, was made by

Phillips. Those were the only purchases made on that day on that basis.

On March 12 there were 2 purchases, both at the same price, that is, at 3⅝¢. One of them was made by Wadhams, a subsidiary of Socony-Vacuum; and the other was made by the White Eagle Division of Socony-Vacuum.

On March 13 there were 3 purchases made: 1 at 3⅝¢, and 2 at 3⅞¢. The 1 at the lower price, that is, 3⅝¢ was made by Wadhams, a subsidiary of Socony-Vacuum; and the 2 at the higher price, 3⅞¢ were both made by Phillips.

We have 6 purchases on the 14th. 1 was made at 3⅝¢, 4 of them at 3¾¢, and 1 at 3⅞¢. The 1 at the lower price, that is, 3⅝¢ was made by the White Eagle Division of Socony-Vacuum. On that same date, the White Eagle Division made another purchase, but at a different price; namely, 3¾¢. Phillips made on that date 3 different purchases; 2 at 3¾¢, and the third at 3⅞¢. Mid-Conti-
2930 nent also made a purchase on that date at 3¾¢.

There were no purchases on March 15, and there was 1 on March 16. That was made at 3¾¢ by the White Eagle Division of Socony-Vacuum.

March 17 was Sunday. On March 18 there were 3, all at the same price, and by Mid-Continent.

On March 19 there was only 1; it was by Barnsdall, at 3⅞¢.

I have 2 purchases for March 20 at different prices; 1 by Globe at 3½¢, and 1 by White Eagle Division of Socony-Vacuum at 3¾¢.

There were quite a large number of purchases on March 21. There were 7 made at 3 different prices. There was 1 made at 3¾¢ by White Eagle Division of Socony-Vacuum. On that same date, that Division made another purchase at a different price, that is, at 3⅞¢. Phillips made 3 purchases on that date, all at the same price; that is, 3⅞¢. Continental made 1 purchase at 4⅛¢; and Standard of Indiana made 1 purchase on that date at 3⅞¢. 5 different majors bought on that date, at 3 different prices. White Eagle Division of Socony-Vacuum paid 2 different prices.

There were 3 purchases on March 22, all at 1 price. They were all made within the Socony-Vacuum organization. 2
of them were made by White Eagle Division, and 1 by
2931 Wadhams, a subsidiary of Socony-Vacuum. On March
23 there were 2; 1 by the White Eagle Division of Socony-Vacuum, and 1 by Barnsdall. Both were made at the same price, 3⅞¢.

There were 3 purchases on March 25, at 2 different prices; 2 by Mid-Continent at 3⅞¢, and 1 by Wadhams at 4¢.

On March 26 there were 4 purchases, at 3 different prices. White Eagle Division of Socony-Vacuum made 1 at 3⅞¢. Phillips made the remaining 3 purchases, but at 2 different prices; 2 purchases were made at 4¢, and 1 at 4⅜¢.

I have no purchases for March 27th.

On the 28th there were 4 purchases at 3 different prices. Globe made 1 at 3¾¢, Mid-Continent made 2 at 3⅞¢, and Phillips made 1 at 4⅛¢.

In the whole month of March there were 13 days when more than 1 company purchased on the same day. Of those 13 days, there were 9 when different prices were paid. On 5 of those days 2 different prices were paid, and on 4 of those days 3 different prices were paid. That covers all defendant major purchases on a Group 3 basis, with the exception of Sinclair, during the month of March.

The paper you show me is the tabulation that I made, setting forth the facts I have just described.

(Document referred to is marked EXHIBIT 874 and received in evidence.)

2932 In the month of April, 1935, there were 22 days when more than 1 company purchased.

On April 2 there were 3 purchases at 2 different prices. I am still talking about purchase transactions and not the number of cars purchased.

On this date the Lubrite Division purchased at 1 price and Wadhams, a subsidiary of Socony-Vacuum, purchased at another price. Lubrite bought at 4¢ and Wadhams bought at 4⅛¢.

On April 3 there were 2 purchases, 1 by Phillips and 1 by Wadhams, and both at the same price, 4⅛¢.

There were 3 purchases on April 4, all at the same price, 4¢. The Lubrite Division and the White Eagle Division of Socony-Vacuum each made a purchase, and Mid-Continent made the third purchase.

On the next day, April 5, there were 2 purchases by the White Eagle Division.

The following day, April 6, there were 2 purchases at different prices, but both made by Wadhams; 1 purchase made at 4⅛¢ and the other at 4¼¢.

The next day is Sunday. The following day, Monday, there were no purchases by any majors. But on the day following, on April 9, there were 2 purchases, both at the same price. 1 was made by Phillips, and the other was made by Shell. They were both made at 4⅛¢.

2933 On April 10th there were 5 at 3 different prices. The prices were 4⅛¢, 4¼¢, and 4½¢. The 2 purchases at 4⅛¢ were made by Mid-Continent and White Eagle Division of Socony-Vacuum. The purchase at 4¼¢ was made by Wadhams, a subsidiary of Socony-Vacuum. The 2 at 4½¢ were made by Globe and Phillips.

The following day, April 11th, 2 purchases were made at the same price, 4⅛¢, 1 by White Eagle Division and the other by Lubrite Division of Socony-Vacuum, and 3 more on that same date, that is, on April 11, and at the same price as paid by White Eagle and Lubrite, but all 3 of those were made by Phillips. They were all made at 4⅛¢.

On April 12th, 2 purchases were made at 2 different prices, 1 by White Eagle and the other by Phillips. There was quite a spread that day. 1 at 4⅛¢, and the other at 4⅝¢. White Eagle paid the low price.

The following day, April 13, there were 3 purchases at 2 different prices. Barnsdall and Phillips bought at 4⅛¢ and Mid-Continent bought at 4¼¢.

The 14th was Sunday. The next business day, April 15, there were 2 purchases at 2 different prices, 1 by Mid-Continent at 4⅛¢, and 1 by Barnsdall, ¼¢ higher, that is, 4⅜¢.

On April 16, there were 3 purchases. They were all at the same price. 2 of those were made within the
2934 Socony-Vacuum organization, 1 by White Eagle and the other by Lubrite; the third was made by Phillips. They were at 4⅛¢.

2 purchases were made on the 17th at 2 different prices, 1 by Empire at 4¼¢, and 1 by Wadhams at 4⅜¢.

On the following day, April 18th, there were 4 purchases at 2 different prices. 1 of them was made by White Eagle Division of Socony-Vacuum at 4⅛¢. The remaining 3 were all made by Phillips at ¼¢ higher, 4⅜¢.

On the 19th there were 2 purchases, both at the same price, 4⅜¢, one made by Globe, and the other made by Phillips.

On the 20th there were 3 purchases at 3 different prices. 2 of them were by Phillips, but at different prices. 1 was at 4⅜¢ and the other at 4½¢. And the third was by Globe at 4⅝¢.

The day following is Sunday, but the next business day, April 22, there were 7 purchases, at 2 different prices. 3 of them were by Phillips at different prices: 2 at 4⅜¢, and 1 at 4½¢. Globe bought on that day at 4⅜¢. Shell made 2 purchases at 4⅜¢, and Skelly made 1 purchase at 4⅜¢.

On April 23rd there were 6 purchases at 3 different prices. 1 was made by White Eagle Division of Socony-
Vacuum at 4⅛¢. 2 more were made by White Eagle
2935 at 4⅜¢. 1 was made by Lubrite Division of Socony-
Vacuum at 4½¢. The other 2 purchases were made by Phillips at 4⅜¢.

On April 24 there were 3 purchases made at 2 different prices: 1 was made by White Eagle Division of Socony-Vacuum, at 4⅜¢, and 2 were made by Phillips at 4½¢. On April 25th there were 8 purchases made, at 2 different prices. 1 was made by Mid-Continent at 4⅜¢. Empire made 2, at the same price. Lubrite made 1. And White Eagle made 2 purchases. All of those were at 4⅜¢. Phillips made 2 purchases at 4½¢.

We have a lot of them for the 26th. We have 12 of them, at 2 different prices. Mid-Continent made 2 of them at 4⅜¢. Lubrite made 3 of them at 4⅜¢. White Eagle, another division of Socony, made 1 at 4⅜¢. And then Wadhams, a subsidiary of Socony-Vacuum, made 1 at 4½¢. And Phillips made 5, at 4½¢.

On April 27th there were 3 purchases at 2 different prices. 1 was made by White Eagle Division of Socony-Vacuum, at 4⅜¢. And 2 were made by Phillips at 4½¢.

On the 29th there were 4 purchases at 2 different prices. 1 was made by Mid-Continent, 1 by Phillips, and 1 by Skelly. All at the same price, of 4⅜¢. And then Globe made a purchase at 4½¢.

On April 30, there were again 4 purchases at 2 differ-
ent prices. 1 by White Eagle Division of Socony-
2936 Vacuum, at 4⅜¢, and 3 by Phillips at 4½¢.
There was 1 purchase by Lubrite on April 1 at 4¢.

In the month of April there were 22 days on which more than one company purchased. I am treating the divisions of Socony-Vacuum as separate entities—that is, Lubrite and White Eagle.

Out of those 22 days there were 17 days when different prices were paid. Out of those 17 days there were 14 days when 2 different prices were paid, and 3 days when 3 different prices were paid.

I have the tabulation of April which I have made of those various purchases.

(Tabulation referred to marked Exhibit 875 for identification, and received in evidence as EXHIBIT 875.)

On May 1, 1935, there were 3 purchases by defendant major companies at 2 different prices. 1 was made for

Barnsdall at 4⅜¢, 1 was made for White Eagle Division of Socony-Vacuum at the same price, that is, 4⅜¢, and 1 for Wadhams, a subsidiary of Socony-Vacuum, at 4½¢.

On May 2, there were 7 purchases, 5 at 4⅜¢, and 2 at 4½¢. The purchases at 4⅜¢ were made by Mid-Continent, Phillips, Skelly, Lubrite Division of Socony-Vacuum, and the White Eagle Division of Socony-Vacuum. But on the same date Phillips and Wadhams, a subsidiary of Socony-Vacuum, each made a purchase at 4½¢.

2937 On the 3rd there was only 1 purchase. That was by Phillips at 4½¢.

There was 1 purchase on May 4th, at 4⅜¢. That was by Wadhams.

The 5th was a Sunday. The next business day, May 6, there were 4 purchases at 2 different prices. Skelly made 1 at 4⅜¢, 2 were made by Phillips and 1 by Wadhams at 4½¢.

There were 3 purchases on the 7th at 2 different prices. 1 was made by the White Eagle Division of Socony-Vacuum at 4⅜¢. 2 were made by Phillips at 4½¢.

The next was the 8th, and there were 6 purchases made on that date at 2 different prices. There were 3 made at 4⅜¢, 1 of them by White Eagle Division, and 2 by Mid-Continent. Now, the other 3 were made at 4½¢. 1 of them was made by Phillips, and 2 were made by Wadhams.

On the 9th there were 4 purchases at 2 different prices. There were 2 made at 4⅜¢, 1 of which was made by Skelly, and the other by White Eagle Division. The other 2 at 4½¢ were both made by Phillips.

On the 10th there were 3 purchases at 2 different prices. 2 at 4⅜¢ were made by White Eagle, and the other, at 4½¢, was by Mid-Continent.

On the 11th there were 2 purchases at different prices. 1 was made by Pure at 4½¢. 1 was made by
2938 Wadhams at 4⅝¢.

The 12th was Sunday. The 13th there were 3 purchases at 2 different prices. 2 of those were made at 4½¢, 1 by Globe and 1 by Phillips. Phillips also made another purchase on that same day at 4⅝¢.

On the 14th there were 8 purchases made at 2 different prices, 4 of them at 4½¢ and 4 at 4⅝¢. Phillips made all 4 purchases at 4½¢ and 1 of the purchases at 4⅝¢. The other 3 at 4⅝¢ were made by Empire, Mid-Continent and White Eagle Division of Socony-Vacuum.

There were 5 purchases on the 15th, all at 4⅝¢. Continental made 2, White Eagle, Wadhams and Skelly each making one.

On the 16th there were 5 purchases made, all at the same price. Phillips made 2, Lubrite, White Eagle and Empire each making one.

On the 17th there were 6 purchases made, all at the same price. Phillips made 4 of them. White Eagle made 1, and Mid-Continent made another. The price was 4⅝¢.

On the 18th there were 7 purchases at the same price, Phillips making 6 out of them. The seventh was by Wadhams. The price was 4⅝¢, the same as the day before.

On the 20th there were 4 purchases made all at the same
price, that is, at 4⅝¢. 2 of those were made by
2939 Empire. Barnsdall and Mid-Continent each made 1.
The price was the same as the day before.

On the 21st there were 5 purchases all at the same price, 4⅝¢. That was the same price as for the 2 preceding days. Continental made 2, Phillips made 2, and Pure 1.

On the 22nd there were 4, all at the same price as the last few days, 4⅝¢. Phillips and Wadhams made 2 each.

On May 23rd there were 4 purchases all at the same price as the last week or so, 4⅝¢. Phillips made 3 of them, and Skelly 1.

On the 24th there were 9 purchases at 2 different prices, 4⅝¢ and 4¾¢. Phillips made 5 of the purchases at 4⅝¢. Globe made 1. Empire made 1, and Continental made 1. And Phillips made a purchase at 4¾¢, that is, made 6 purchases all told that day, 5 at 1 price and 1 at the other price.

On the 25th there were 5 purchases, all by Phillips at 4⅝¢.

The 26th was Sunday. On the 27th there were 5 purchases made at 2 different prices. Pure made 1 at 4⅝¢, and Mid-Continent 1 at the same price. Phillips made 2 purchases at the same price, and a third at 5¢.

On the 28th, there were 8 purchases made at 2 dif-
ferent prices. Mid-Continent made 1 purchase at
2940 4 9/16¢; Pillips made 4 purchases, Skelly 2 purchases,
and Pure 1 purchase, all at the same price of 4⅝¢.

On the 29th, there were 16 purchases, at four different prices. Wadhams made the purchase at the lowest price, 4⅜¢. Barnsdall made 1 purchase, and Globe made 2 purchases, at 4½¢. Globe also made 5 purchases at 4⅝¢. Skelly made a purchase at 4⅝¢. The White Eagle Division of Socony-Vacuum made 2 purchases at 4⅝¢. Phillips made 3 purchases at 4⅝¢, and still another purchase at 4¾¢.

On the 30th, there were just 2 purchases, both made at the same price, 4⅝¢. 1 was made by Mid-Continent, and the other by Phillips.

There were 10 purchases on the 31st, at 2 different prices. Phillips made 7 purchases, and Pure 1, at 4⅝¢. Continental made 2 at 4¾¢.

That finishes the purchases for the month of May, 1935.

When I used the word "Barnsdall" I was not referring to Barnsdall Refining Corporation, the defendant herein, but to its predecessor, the Barnsdall Oil Company.

There were 24 different days in May when more than 1 company purchased. Out of those 24 days there were 15 days when different prices were paid. Out of those 15 days, 2 different prices were paid on 14 days. On none of those days were 3 different prices paid; there
2941 was 1 day on which more than 3 prices were paid.

I have here the tabulation for the prices paid in the month of May.

(Tabulation referred to is marked EXHIBIT 876 and received in evidence.)

By Mr. Francis

Mr. Francis: I would like for the record to show, if the Government would agree—it is a fact that those shipments he mentioned here, of The Pure Oil Company's purchases on three dates, May 21, 27 and 28, were from Simms Oil Company at Harry's, Texas.

Mr. Chaffetz: Subject to our check, the record may so show.

Harry's, Texas is either in the Panhandle or North Texas.

By Mr. Beatty

All of these purchases that I have enumerated were purchased on the basis of either f. o. b. Group 3 or f. o. b. refinery, Oklahoma.

I haven't divided these in my computations or audit for this month, because I consider that those two are comparable; that is, there is a freight equalization, so that the freight would not be a factor; they ought to sell pretty much on a parity.

A purchase made in Oklahoma City, for delivery in
2942 Oklahoma City, would not necessarily reach a parity with Group 3 basis. I haven't made a classification that would cover that point. If there are any local deliveries from an Oklahoma refinery there could well be a dif-

ference; that is, there would not necessarily be a parity with the price paid for a northern shipment, and I have made no distinction on that at all.

By Mr. Donovan

There were 4 purchases made by defendant major companies on June 1, 1935 at 2 different prices. 1 was made at 4½¢, and 3 were made at 4¾¢. The 1 made at the lower price was by Wadhams; and there was 1 each by Continental, Empire and Phillips at the higher price.

June 2 was a Sunday. But on June 3, the next business day, there were 4 purchases made at 2 different prices. Empire, Wadhams and Pure each bought at 4⅝¢. Phillips made 1 purchase at 4⅞¢.

There were 8 purchases made at 3 different prices the following day, the 4th. Wadhams made 1 purchase at 4⅝¢. Empire made a purchase at 4¾¢. Phillips made 2 purchases at 4¾¢. Skelly made 1 purchase at 4¾¢. Mid-Continent made 2 purchases at 4¾¢, and another at 5¢.

On June 5, there was just 1 purchase. That was made at 4¾¢ by Phillips.

On the 6th, there were 7 purchases made, at 4
2943 different prices. Skelly made 1 at 4½¢. Mid-Conti-
nent and Globe each made 1 at 4⅝¢. Skelly made 1
purchase and Phillips 2 at 4¾¢. Skelly made another at
4⅞¢. On that day, Skelly made 3 at 3 different prices.

On the 7th, there were 5 purchases at 3 different prices. Globe made 2 of those at 4⅝¢. Pure made 1, and Empire made 1, at 4¾¢. Wadhams made another at 4⅞¢.

On June 8 there were 4 purchases made at 2 different prices. Wadhams made 1 at 4⅝¢; the White Eagle Division of Socony made another at 4¾¢. Then Phillips made 2 purchases at 4¾¢.

The 9th was a Sunday. On the 10th there were 6 purchases at 3 different prices. Wadhams made 1 at 4½¢; then it made another at 4⅝¢. Mid-Continent made a purchase at 4⅝¢, and made another at 4¾¢. Both those companies made their purchases at 2 different prices on the same day. Phillips and Skelly each made a purchase on that date, at 4¾¢.

There were 11 purchases on the 11th of June, at 2 different prices. 4 were made by Phillips at 4⅝¢, and 2 more at 4¾¢. Mid-Continent, Skelly and White Eagle each made 1 purchase at 4⅝¢, Skelly made another at 4¾¢, and Empire made a purchase at 4¾¢.

On the 12th, there were 7 purchases at 2 different prices.

Phillips made 5 on that date at 4⅝¢. Mid-Continent
2944 made 1 purchase at 4⅝¢, and 1 at 4¾¢.

The 13th, there were 6 purchases, at 3 different prices. On this particular day, Skelly again made a purchase at 3 different prices; 1 was at 4⅝¢, another at 4¾¢, and still another at 4⅞¢. Wadhams, a subsidiary of Socony-Vacuum, made 1 purchase at 4⅝¢, and the Lubrite Division of Socony-Vacuum made 1 purchase at 4¾¢. Mid-Continent also made 1 at 4⅝¢.

There were 4 purchases on the 14th at 2 different prices. Mid-Continent made 1 at 4⅝¢, and Phillips, Empire and Skelly each made 1 purchase at 4¾¢.

There were 2 purchases made on the 15th, both at the same price, and both by Wadhams.

The 16th was a Sunday. There were 3 purchases on the 17th at 2 different prices. Skelly made a purchase at 4⅝¢, and still another purchase at 4¾¢. Phillips also bought at 4¾¢.

I have 7 purchases on the 18th at 3 different prices. Mid-Continent made 2 at 4⅝¢. Empire made 1 at 4¾¢. Continental made 3 purchases at the same price, and Wadhams made 1 at 4⅞¢.

There were 3 purchases on the 19th, at 2 different prices. Mid-Continent made 1 at 4½¢. White Eagle and Phillips each made 1 at 4¾¢.

On the 20th there were 11 purchases, at 2 different prices. Mid-Continent made 3, and Wadhams 1 purchase, at 4⅝¢.
Pure made 5 at 4¾¢. Empire and Skelly each made
2945 1 at that same price.

I have only 1 purchase on the 21st, and that was made by Mid-Continent at 4⅜¢.

The 22nd, there was only 1 purchase. That was at 4¾¢, by the White Eagle Division of Socony-Vacuum.

The 23rd was a Sunday. On the 24th, there were 3 purchases, all at the same price. 2 were by Phillips, and 1 by Skelly.

On the 25th, 4 purchases, at 2 different prices. Mid-Continent bought at 2 different prices on this date, making 1 purchase at 4⅝¢, and 1 at 4¾¢. Wadhams made a purchase at 4⅝¢, and Skelly made 1 at 4¾¢.

On the 26th, there were 2 purchases, both at the same price. 1 was by Phillips, and 1 by Skelly.

The 27th, there were 9 purchases at 3 different prices. Empire and Mid-Continent each made a purchase at 4½¢. Mid-Continent made another at 4⅝¢. Phillips and Wadhams each made 1 at 4⅝¢, and Phillips made another at 4¾¢. Empire made 1, and Continental 2 at 4¾¢.

On the 28th there were 2 purchases at the same price, Barnsdall and Phillips each making a purchase.

The 29th: 5 purchases at 2 different prices. Mid-Continent made 2 at 4⅝¢, and Empire made 1 and Phillips 2 at 4¾¢.

2946 Those are all the purchases for June, 1935.

There were 21 days out of the month of June when more than 1 company purchased on the same day. Out of these 21 days, there were 18 days when different prices were paid. 2 different prices were paid by these major company defendants on 11 days out of those 18: 3 different prices were paid on 6 of those 18 days. There were 4 different prices on 1 of those 18 days.

I have here the tabulation for June, 1935.

(Table referred to marked EXHIBIT 877 and received in evidence.)

I have a copy of Exhibit 748.

I have been furnished with a list prepared by the Government's auditors showing those purchases claimed to have been made by the defendant major companies in the East Texas field above the low quotations for the trade publications, both publications. I have made an analysis of these purchases.

At the suggestion of the auditors for the Government I have had some discussion of my analysis of these figures supplied by the Government with Mr. W. J. Miller and his assistants, the Government's auditors. We were asked, when this list was furnished us, to state, after going over them, just what exceptions we might take—what would be the general nature of any difference of opinion, and that is what we took up with them.

2947 I think, to explain the way I have analyzed the list of purchases supplied to me by the Government auditors, it would be best to first describe what these Government exhibits show. There were 5 exhibits put in evidence, numbered 747 to 751, both inclusive. Exhibit 751 was in 2 parts, A and B.

The first, Exhibit 747, contains this heading, "Purchases of house brand and third-grade gasoline by defendant companies other than Sinclair Refining Company from independent refineries during the period, March 1, 1935, to April 30, 1936." This first Exhibit shows the volume of purchases by the defendant major companies other than Sinclair.

At the time this Exhibit was made up, of course, there were more defendant companies than there are now. That is, this contains the purchases by Cities Service Export

Oil Company, Louisiana Oil Refining Corporation, Tide Water Oil Company, The Texas Company, and Gulf Refining Company, which are no longer in this case. So I have ignored those in my study, if there were any.

This first Exhibit 747 shows purchases by each of the defendant companies monthly. It is further divided up as to whether the material came out of the East Texas or the Mid-Continent field. And, of course, it is confined to regular grade gasoline and third-grade gasoline. It
2948 covers a 14 month period from March 1, 1935, through
to April 30, 1936. That Exhibit is designed primarily to show: Volume of purchases, where the material came from, who made the purchases, and in what months they made them.

Exhibit 748 deals primarily with a price comparison of the purchase prices paid by these major companies in buying this material from the East Texas field. It deals solely with the East Texas purchases, and the price comparison made is with the quotations appearing in Platt's Oilgram on the date of purchase. Not the date of shipment, but the date of purchase. The heading on Exhibit 748 doesn't state which Platt's Oilgram is used, but the oral testimony at the time this exhibit was introduced indicates that the comparison was made with Platt's Oilgram quotations for the f. o. b. East Texas refinery market.

I might describe what that is. That is the price that a purchaser would pay a refinery located in East Texas buying f. o. b. refinery. We will say the refinery is at Gladewater in the East Texas field. That refiner might quote one price, f. o. b. refinery, and might quote still a different price, f. o. b. Group 3. F. o. b. Group 3 is Oklahoma or what is often referred to as the Tulsa area. If a shipment goes north out of the East Texas field and if the purchaser bought it on a basis of f. o. b. refinery, the purchaser
2949 would pay the freight from the refinery the whole way
north to its destination. That distance would be greater than the distance from Tulsa north. Therefore, the purchaser would pay more freight on that shipment than if he bought it f. o. b. Group 3, because if he bought it on that basis the refinery, that is, the seller, would pay the difference between the total freight and the freight on an f. o. b. Group 3 basis.

That difference was equalized where a man at Chicago bought gas in Texas for the same price delivered in Chicago as he bought it in Oklahoma delivered in Chicago, if he bought it on a basis delivered, but that was very seldom done. He either paid a certain price f. o. b. Group 3, or perhaps a greater—maybe he paid a lesser price f. o. b. refinery.

The Court: Q. And in order for the East Texas field to compete with the Oklahoma fields, wasn't there some allowance made there?

A. Yes, that would be if they were in competition. Now, of course, they weren't always in competition, because a lot of material in East Texas moved down to the Gulf, and as a matter of fact, sometimes it happened that the prices that were quoted at f. o. b. refinery in East Texas were even higher than Oklahoma refinery prices. Just dependent upon what the competitive situation was at any one time.

The Court: All right.

2950 There is a term, "equalizing," used in some such situation. If there was to be a freight equalization, it would be roughly 1/6¢, that is, on a northern shipment, and occasionally you would see on an invoice some adjustment, usually figured out on so much a hundred-weight rather than a fraction of a cent a gallon.

As I stated, Exhibit 748 compares purchase prices on the date of the order with Platt's Oilgram quotations for the f. o. b. East Texas refinery market.

Exhibit 749, that is the next exhibit, makes the same comparison with the same purchases; that is, the purchases out of the East Texas field, except that the comparison is made with quotations in the Chicago Journal of Commerce. And those are on an f. o. b. Group 3 basis. So, the comparison is made here with two different markets; one, f. o. b. Group 3, as reported in the Chicago Journal of Commerce; and one, f. o. b. refinery in the East Texas field, as shown in Platt's Oilgram.

The remaining exhibits deal with purchases made in the Mid-Continent field; and I haven't completed my examination yet of the list furnished us by the Government of the Mid-Continent purchases—only of the East Texas, so that we are dealing only with East Texas.

We found about 5 different types of errors in this computation dealing with materials coming out of the East 2951 Texas field. We found an error of this type: erroneous classification as to field itself; then we found errors in the classification.

The Government's list covered only those cars shown to have been purchased above the low of the two different publications. Exhibit 748 shows 39 cars to have been purchased ⅛¢ above the low of Platt's Oilgram. 1 of those cars was purchased by Louisiana Oil Refining Corporation, no longer a defendant in this case. So I am dealing with 38 cars shown in Exhibit 748 to have been purchased above the low of Platt's Oilgram. Exhibit 749 shows 16 cars to have been purchased above the low of the Chicago Journal of Commerce out of the East Texas field. So that I am dealing with the 16 shown on Exhibit 749, and the 38 cars shown on Exhibit 748. That is a total of 54 cars.

These exhibits divide up the gasoline as to the origin of shipment by fields; that is, whether it came out of the East Texas or whether it came out of the Mid-Continent field. And there is an error here in the classification as to field—where the shipment originated. I can illustrate that: The very first one on the Government's list is a purchase by Barnsdall Refining Company of 1 car out of the East Texas field shown to have been purchased at 1/8¢ above the Platt's Oilgram quotation. That particular car was bought through the Tansel Petroleum Company. Now, Tansel is a
2952 broker, with offices in Tulsa, and the origin of that shipment was Oklahoma City, and Oklahoma City is in the Mid-Continent field. It isn't in the East Texas field. So, to that extent, there was a mistake made in setting up this chart, this tabulation, by the Government. That did not belong to the East Texas field.

Mr Chaffetz: Q. Only one car?

A. One car out of 54 that I checked into.

That gasoline was refined in Oklahoma City. The records don't show by what refinery. They only show the origin of the shipment, and the origin of the shipment is Oklahoma City, from Tansel, the broker. I know Tansel got it from Oklahoma City.

The other type of error that I said we found was the erroneous classification of purchases as to months. These exhibits deal with the volume of purchases by the majors by months. Now, there were times, I think, when the Government accountants weren't able to locate the purchase orders, so they weren't able to determine when the material was bought, and in that event I assume that they classified it as to the month of shipment rather than the month of purchase. We found, for instance—you will note on Exhibit 748—it shows that The Pure Oil Company bought 15 cars at 1/8¢ above the low quotation of Platt's Oilgram; and the Government list shows that those cars were bought, 11 in June, 1935 and 4 in July, 1935. Now,
2953 as a matter of fact, those cars were bought as follows: 5 cars on June 20th. 6 cars on June 24th. 1 car on

June 27th. 2 cars on June 28th. 1 car on June 29th. All 15 cars were bought in June. Now, that may be rather important when it comes to comparing the purchase price with the quotation in the publications because the quotations may change from day to day or from month to month; and you have got to compare the purchase price with the quotations on the date of purchase; because all these comparisons in these exhibits are made with the publications on the date of purchase. These are flat price purchases. And if you are going to make any comparison with trade publications you have got to make comparison on the date that the purchase was made.

Mr. Lewin: Q. As a matter of fact, there wasn't any change between June and July, was there?

A. Not on this one that I illustrated, no.

Then I found still another type of error; and that was the classification of the material. These exhibits purport to show only purchases made by majors of regular grade and third grade gasoline. Now, we found, in going back to this car, again, that it was purchased by Barnsdall from Tansel Petroleum; that material was 68 to 70 gravity, 360 endpoint material. That is a special grade. That is a grade of gasoline all by itself. It cannot be compared with
2954 regular grade quotations nor third grade quotations. That is a type of material that usually commands a substantial premium in price over third grade material. As a matter of fact, it was compared with third grade quotations on that date.

Mr. Chaffetz: Q. I understand that is the same one car that you referred to previously,—not a different one?

A. Yes, that is the same.

As a matter of fact, I might say that there were four different mistakes in the handling of that car.

There is still another error in connection with that particular shipment. Those exhibits purport to show the purchases made by the major companies from independent refiners, and, of course, Tansel is not a refiner of any type. He is a broker.

Then we found errors of this type, too: We found material was classified in these exhibits as having been purchased on a flat price basis when as a matter of fact it was purchased on a publication basis. We did not find any of that type of errors in connection with these East Texas purchases, but we have gone far enough in our check of the material going out of the Mid-Continent field to find that type of errors. I will have a list of those very shortly.

But now here are some clerical errors we found in
2955 connection with the purchases out of the East Texas
field. For instance, here were these clerical errors: The Government's list shows 7 cars to have been bought by Wadhams from East Texas Refining Company in October, 1935, and all 7 of those to have been purchased at ⅛¢ over the low quotation appearing in Platt's Oilgram on the date of the order. Now, this is wrong in several particulars. In the first place the number of cars is wrong. There were 8 cars, and not 7. Then as to the price comparison it must be distinctly wrong, because the purchase was made at 4⅝¢ and Platt's Oilgram did not quote a price, a low at that time of less than 4⅝¢. In fact it did not quote a price of less than 4⅝¢ at any time throughout the month of October.

The most serious error is the use of improper comparison by ignoring the f. o. b. point, and we find that the majority of these are wrong in that regard. I mentioned different dates of purchase by Barnsdall from Tansel. Now, here was a comparison of an f. o. b. Group 3 purchase with quotations on an f. o. b. refinery basis down in East Texas. That, of course, was erroneous, but, as I stated before, it never should figure here because it was not third grade material. I might say, too, incidentally, in connection with
that, that it was not purchased above the low as
2956 quoted by Platt's Oilgram for 360 endpoint material.

I mentioned before the 15 cars purchased by Pure Oil Company. Those were purchased from Texas Oil & Products Company, and they were all purchased on an f. o. b. Group 3 basis. Consequently the price paid is not at all comparable with those quoted in Platt's Oilgram for the f. o. b. East Texas refiners' market. Now, Platt's Oilgram does contain quotations for material coming out of the East Texas field if purchased on an f. o. b. Group 3 basis. That is the comparison that should be made if you are going to compare with Platt's Oilgram, and if the comparison had been made with that it would be found that not a single one of those 15 cars was purchased over the low. There was no purchase made over the low of Platt's Oilgram if the proper comparison was made, taking into account the f. o. b. point.

The same is true with reference to one more purchase by Socony-Vacuum from the East Texas Refining Company, which is shown in Exhibit 748. That purchase was made in March, 1936. Exhibit 748 shows that to have been purchased at ⅛¢ over the low. If the proper comparison was made with the proper market in Platt's Oilgram, you would find it was not purchased over the low.

2957 That is true also with respect to those 8 cars purchased by Wadhams that I mentioned a little while ago as having been purchased from the East Texas Refining Company in October, 1935. They were purchased on an f. o. b. Group 3 basis.

Now, Wadhams made another purchase from the East Texas Refining Company. This was made on March 25, 1936, 4 cars purchased on an f. o. b. Group 3 basis. The Government Exhibit 748 shows these to have been purchased at ⅛¢ over the low. They were actually purchased at the low as quoted in Platt's Oilgram for third grade material coming out of East Texas if purchased on an f. o. b. Group 3 basis.

We have the same situation with respect to 10 cars purchased by Skelly from the East Texas Refining Company in July, 1935. Those were purchased on an f. o. b. Group 3 basis. That purchase was made at the low as reflected in Platt's Oilgram, if you use the Group 3 quotations on material coming out of East Texas.

You will find the same type of error if you refer to Exhibit 749, because here again improper comparison is made, because some of these purchases were made on an f. o. b. refinery basis out of East Texas, and in Exhibit 749 they are compared with the Chicago Journal of Commerce which is on a Group 3 basis.

That Barnsdall item, I covered before. It also appears in Exhibit 749.

2958 Continental purchased 10 cars from Radio Petroleum Company in March, 1935. Exhibit 749 shows that to have been purchased over the low of the Chicago Journal of Commerce, which quotations are on a Group 3 basis. Those 10 cars were purchased on an f. o. b. East Texas refinery basis, and Platt's Oilgram quoted material coming out of East Texas on an f. o. b. refinery basis on the date this purchase was made at 3½¢. That is exactly what this purchase was made on. It was made at 3½¢ f. o. b. refinery, so that it was not purchased over the low, and it could not be compared with the Chicago Journal of Commerce because that is limited to a Group 3 basis.

That covers all the improper comparisons with the wrong market.

I was dealing with 55 cars but if we eliminate the one of Louisiana Oil, that brings it down to 54. Now, Barnsdall recurs in the later exhibit, so that we are actually dealing here with about 53 cars.

In dealing with 53 cars, we found all of them wrong but 5 on one account or another. That is, we found mistakes in 48 cars out of 53.

Mr. Crawford: One car had 5 mistakes.

A. Yes, but I am not repeating that.

There is something special about those 5 cars that we
did not find any mistakes in. 1 of those cars was
2959 purchased for the Socony-Vacuum from East Texas
Refining Company on March 24, 1936, on an f.o.b.
Group 3 basis, and it was purchased at 1/8¢ over the low quotation in the Chicago Journal of Commerce for third grade material, but it so happened that this order specified 60 to 62 gravity 400 endpoint material, and this type of material quite frequently commanded a premium of 1/8¢.

Now, as to the other 4 cars, they were purchased by Wadhams from the East Texas Refining Company on March 25, 1936 on a Group 3 basis. The purchase consideration was just as shown in the Government exhibit, 1/8¢ over the low quotation of the Chicago Journal of Commerce, but on that particular date Platt's Oilgram quoted a low for East Texas material on a Group 3 basis at the very price at which this was purchased, so that although it was purchased above the low of one publication, it was purchased at the low of the other.

That completes my analysis of those 54 cars in the East Texas field.

Cross-Examination by Mr. Chaffetz.

Those 15 cars purchased by Pure as shown by the Government exhibit purchased in July, were actually purchased
on various dates in June, 1935. I got my information
2960 as to the actual dates of purchase from the purchase
orders among the records on file here. As to those 15
cars there were some very rigid specifications too, on vapor pressure, and in other regards. I do not recall, but the specifications were quite rigid on that material. It did not make any difference whether the date was in July or in June, as the published price on all those dates was exactly the same on that particular order. That is what I was talking about, that particular order, but I am describing the

types of error made, which could be made in other instances.

Q. But the only errors you found are in connection with those 15 cars?

A. Out of those 54 cars.

Q. And the error as to those 15 cars did not make any difference because the published price was the same; isn't that true?

A. No, it might make a difference.

Q. I asked whether it did make a difference with respect to those 15 cars?

A. Well, it does make a difference if you are dealing with Exhibit 747, the very first exhibit which shows your volume of purchases by months. Now, that is wrong.

Direct Examination (Continued) by Mr. Donovan.

I have had made under my supervision an audit of
2961 the purchases made by Shell Petroleum Corporation
from independent refiners in 1935 and 1936. The objective of my audit was to ascertain the quantity of purchases by Shell, the type of material bought, the price paid, the basis upon which it was purchased, and to compare the prices with the proper quotations in the trade publications.

In our examination, we did not find that all of the gasoline purchased by Shell was either regular or third-grade. They bought so-called intermediate bracket material, and they also bought premium gasoline. That would be a grade higher than regular grade. They bought a great deal of this intermediate grade from the Cushing Refining Company. It was the premium grade that they bought from the East Columbia refinery of Danciger. I did not make any comparison between the trade paper prices and the prices paid for the 70-73 octane and the intermediate octane gasoline which I have mentioned, because there were no such quotations in the trade journals during the period that I made the examination. There are now, I think.

We were making a comparison to April 30, 1936, and I think it was the middle of April, 1936, that the publications began to quote for the first time on the intermediate bracket.

Shell made some but not all of its purchases from
2962 independent refiners on a Group 3 basis. They
bought in both ways, f. o. b. Group 3 and also f. o. b. refinery.

I have made a comparison of the prices paid by Shell with the Group 3 prices shown in the trade journals in 1935 and up through April, 1936, only as to the regular grade and third-grade bought on f. o. b. Group 3 basis or on f. o. b. refinery basis, Texas or Oklahoma. I have the price, also, of the material bought out of East Texas on an f. o. b. refinery basis.

During the period of March, April and May, 1935, when the tank car prices were going up, all purchases made by Shell of regular grade and third-grade gasoline out of any field, as long as it is purchased on f. o. b. Group 3 basis, or f. o. b. refinery basis out of Oklahoma, are included, so that if there was any material that was bought out of the East Texas field, but bought at a flat price on f. o. b. Group 3 basis, it is included in that tabulation. Shell did not make any purchases in any field except on a Group 3 basis during the period of the price rise—that is limited to regular grade and third-grade gasoline, of course.

During the period March, April, and May, 1935, the prices paid by Shell on Group 3 basis lagged behind the market. During this period of March, April, and May, 1935 100% of Shell purchases of regular and third-grade gasoline were at prices below the low of the market as shown on
2963 both trade journals.

I have prepared a chart which would illustrate the comparison between the prices paid by Shell and the prices shown in the trade publications. That chart was prepared at my direction and under my supervision.

(Chart referred to marked Exhibit 889 for identification.)

This chart, Exhibit 889, shows the purchases made by Shell Petroleum Corporation from independent refiners on a flat price basis, either f. o. b. Group 3 or f. o. b. refinery out of Oklahoma. It covers the entire year 1935, and runs down to April 30, 1936. It shows the purchases made of regular grade, if any; as a matter of fact, there were none, and of third grade material. It excludes intermediate bracket and premium gasoline. It excludes any purchase made on a publication basis because you couldn't plot a purchase on here which is made on such basis, since those purchases are plotted as of the date of the order. If you make a purchase on a publication basis, you wouldn't know what price you are going to pay when you make the order. You only know when it is shipped, because the price is fixed by the publication of the date of shipment so you have to wait to the date of shipment to determine what the price is. You don't know when you make the purchase.

This exhibit that I have here is set up in the same way
as the chart I explained day before yesterday in re-
2964 gard to Mid-Continent's purchases.

This chart, Exhibit 889, doesn't include any purchases made at a flat price if they were made f. o. b. refinery from refineries out of the Oklahoma market. For instance, there may be purchases made from a refinery down in North Texas or in East Texas or in Kansas or in Louisiana or Arkansas. Now, all those have their special markets. They may vary somewhat with the Oklahoma refinery market price, and they would not be comparable with these quotations.

These quotations on this chart are Chicago Journal of Commerce for one publication, which is limited to an f. o. b. Group 3 basis. The Platt's Oilgram quotation shown on here is for the Oklahoma refinery market, which is comparable with f. o. b. Group 3.

Everything that is here in red (indicating) shows the quotations in Platt's Oilgram for the Oklahoma refinery market; the upper line being regular grade, and the lower line being third grade.

The part that is hatched (indicating) represents the quotations appearing in the Journal of Commerce; the upper line again being for regular grade, and the lower line for third grade.

The horizontal lines are the same as on the charts that have appeared here before, each line here (indicating) rep-
resenting a difference of 1/8¢. These are the fractions
2965 of a cent per gallon. Practically all gasoline is sold
on the basis of a fraction of 1/8¢; that is, that is the
fraction used, 1/8¢.

These vertical lines (indicating) represent days; each space in between is a day. Wherever you happen to see blank spaces in there, that indicates a Sunday or a holiday.

These black dots (indicating) represent all the purchases during this entire period of 1935 and the first 4 months of 1936, which were made by Shell of third grade gasoline on either an f. o. b. Group 3 basis or an f. o. b. refinery basis out of Oklahoma. Those dots are plotted as the date of the order. The first one is on April 9, at a price of 4 1/8¢. That means that on that particular day Shell made a purchase from an independent refiner at 4 1/8¢ of third grade material.

There are cases where there was more than one purchase on the same day. There is one December 10. Under that particular dot we put the number 2. That indicates that on that particular day there were 2 purchases made by Shell of third grade material at the same price. That price appears to be 4¾¢. I followed the same practice in preparing this chart as I followed in preparing the Mid-Continent chart, in first looking up the day when the purchase was made, and then putting it on the chart on the appropriate day.

2966 The total for f. o. b. Group 3 purchases and f. o. b. Oklahoma refinery purchases is 13 transactions. 10 of them were at the low of Platt's Oilgram. That is about 77%. 3 were priced below the low. It would be about 23% of the total. None were at a price above the low of the market, as shown by Platt's Oilgram or the Chicago Journal of Commerce during this period.

A total of 174 cars were bought by Shell on a flat price basis, f. o. b. Group 3, or f. o. b. Oklahoma refinery market, from January 1, 1935, through April 30, 1936. No cars were bought above the low. 149 cars, i. e. about 85.5%, were bought at the low. 25 cars, i. e. about 14.5%, were bought below the low; no cars at above the low.

The publication I have been referring to has been Platt's Oilgram; and it so happens in this particular case, it would make no difference if the figures were calculated as against the Chicago Journal of Commerce.

All the cars purchased during the period of March, April and May in 1935 were under the low. There are 2 transactions here, in April; 1 on April 9, 1935; and April 22, 1935. The April 9, 1935 transaction represents 5 cars. In both instances these were below the low of both publications. Those are all the transactions that occurred in that period, in March, April and May, 1935, when the market was rising—on a Group 3 basis.

2967 Of course, you can't make any comparison of purchases f. o. b. a refinery market other than the Oklahoma refinery market with the Chicago Journal of Commerce, because the Journal is limited to f. o. b. Group 3. I wouldn't include such purchases in a comparison with the Journal. I think the comparison is erroneous, to begin with. But I would compare them, if I were making any comparison with a trade journal, with Platt's Oilgram for that particular market. In the Oilgram, as I said before, we have quotations for material bought f. o. b. refinery, out of the various refinery districts. By refinery districts, I mean Louisiana and Arkansas and North Texas, West Texas, East Texas and Kansas. So any purchases made f. o. b. refinery out of those particular districts, we have quotations for. I would limit my comparison to that. But if I had included such purchases as compared with the Journal, there would have been an increase in the proportion of purchases below the low. There would not have been any above the low.

I have made a comparison between the prices paid in these f. o. b. refinery purchases and the various f. o. b. refinery markets quoted in the Oilgram. I have no chart for it, but I have those quotations available.

There was a purchase of third grade gasoline on June 3,
1935 at 4½¢, flat price. That was bought f. o. b. re-
2968 finery, East Texas. Now, on that particular day, the
low of the Oilgram for f. o. b. Texas refinery market
was 4⅝¢, so that that was bought at ⅛¢ under the low quotation for third grade material in that particular refinery district. I don't know whether it was bought through the East Texas Refiners' Association.

There was a purchase on July 12, 1935 of third grade gasoline again at 4½¢ bought f. o. b. refinery out of the East Texas district, at which date the low of the Oilgram f. o. b. East Texas refineries was still 4⅝¢. So that was bought under the low.

There was another purchase on August 14, 1935, at 4⅝¢, f. o. b. refinery out of East Texas. That purchase was only 2 cars, and was at the low of the Oilgram quotations.

Another purchase was made on November 11, 1935, of third grade gasoline f. o. b. refinery at 4½¢, at which time the low of the Oilgram was 4⅝¢.

I think that about covers all the purchases made at a flat price, f. o. b. refinery out of East Texas during this period.

I want to make this clear. In talking about these refinery markets, you can get 2 quotations in the refinery district out of the Oilgram; one is f. o. b. refinery and the other
is f. o. b. Group 3 out of that refinery district. I am
2969 dealing with quotations on an f. o. b. refinery basis
out of these various refinery districts.

There was a purchase made of third grade gasoline on September 26, 1935, at 4¾¢; that was bought f. o. b. refinery out of the North Texas district. At that time the low quotation in the Oilgram for that particular market was 4¾¢; so that was bought at the low. That is the only one bought f. o. b. refinery out of the North Texas refinery district.

There was 1 purchase of third grade material on January 20, 1936, bought at 5¼¢, f. o. b. refinery out of Kansas, at which date the Oilgram quoted for that district 5⅜¢; so that that was bought ⅛¢ under the low of Platt's Oilgram. The seller was the Dickey Oil & Refining Company located in Kansas. That is the only purchase on a Kansas refinery basis.

There were some for Louisiana and Arkansas in March and April 1936 of regular grade, but unfortunately I don't have the Oilgram quotations for that market available at the present time. There were none in 1935; they were limited to March and April, 1936.

Cross-Examination by Mr. Lewin.

The seller in the East Texas field from whom the June
3rd purchase was made at ⅛¢ below the low was the
2970 Century Refining Company. The seller in the August
14th transaction where the price paid was exactly at
the low was the East Texas Refining Company.

The fact that there are no black dots on this chart in the months of January, February or March, signified that there were no purchases of the kind I mention made by Shell Petroleum Corporation in that field during those months. It first starts purchasing on the spot market in that field in the way I have mentioned here in April. 2 in April; no more until July.

I could point out which of those dots represent purchases from Cushing Oil & Refining Company.

Q. Are you familiar with the testimony already in the case, that the Cushing Company was Shell's dancing partner?

A. No, I am not.

The first sale on April 9, 1935 was made by Cushing.
That is the very first one. That one on July 16th or 17th
wasn't from Cushing, nor the one in August. September
12, 1935 is the next date of a sale by Cushing representing
15 cars. The first purchase on April 9 represented 10 cars.
The next one on October 10 or 9 is from Cushing; that is
10 cars. The one on October 23 isn't. November 6 is not.
November 20, that is 15 cars purchased from Cushing. One
of the two purchases on December 10th was from
2971 Cushing, amounting to 20 cars. The purchase apparently
on December 17th was not from Cushing. So
that, for 1935, I show transactions with Cushing throughout
that period, totaling only 70 cars.

Q. Now, the witness that preceded you on the stand, I think, testified that Cushing sold Shell Company during 1935 175 cars. Do you know where those other 105 cars are that Cushing sold to Shell, its dancing partner, during this period?

A. Well, I don't know anything about dancing partners, but I know they sold a substantial amount of intermediate bracket material to—that is, Cushing sold a substantial amount of intermediate bracket material to Shell during this period. I think I stated that in my direct examination, at the very beginning.

Q. I didn't recall that. Did Cushing sell Shell during this period any third grade gasoline in terms of the Journal or Platt's Oilgram?

A. Not that I recall.

I knew of a purchase of 10 cars of 63-70 octane under 400 endpoint made by Shell from Cushing on May 27, 1935. That was a purchase of intermediate bracket material. The invoice shows it as 63-70 octane under 400 endpoint,
2972 but it was material that ran from 65 to 67 octane.
That was purchased at 4¾¢. The low of the Journal for regular gasoline on that day was 4¾¢, exactly the same price.

I had another purchase, April 26, 1935, of 10 cars by Shell from Cushing. That is 65-70 octane under 400 endpoint. That is another purchase of intermediate bracket. The price was 5¼¢. The Journal low for regular gasoline on that day was 5¼¢, exactly the same price.

In my study I found a purchase of 10 cars on May 7 by Shell from Cushing of 65-70 octane under 400 endpoint, lemon color. That is another purchase of intermediate bracket gasoline. The price was 5¼¢. The low of the Journal for regular gasoline on that date was 5¼¢. That is the same price exactly. I know that that gasoline was of a lower grade than regular gasoline.

I do not think that the Shell Company was paying a premium for that gasoline. While it was paying the low for regular, it wasn't many octanes below the regular grade, and it might concededly pay the low of the regular grade.

I found a purchase by Shell from Cushing on May 24, 1935, 5 cars at 5½¢, billed at 65 octane. The Journal low on that day for regular gasoline was 5½¢, the same price
exactly. I would not know that lemon color is less
2973 desirable than white gasoline. That particular speci-
fication shows 65 octane. That is all I know about the specification of that material.

Q. I wonder if you overlooked another transaction—concerning June 6, 1935?

A. There is no oversight.

Shell Company did not make a purchase of 65-70 octane 400 endpoint, lemon color, of 5 cars on June 6, 1935, and pay the low of the Journal for regular gasoline. That purchase was made at 5⅝¢, but that was 65 to 67 material. That is the way it is described on the invoice.

65-67 would not necessarily be a lower grade than 65-70. If you have a range stated on the invoice you do not know what your octane is. It is something in that range. If you say 65 to 70, it can be anything within that. It might be 70. But if it is 65 to 67 it is something within a narrower range. If it is 65 to 67 it cannot be higher than 67, whereas if it is from 65 to 70 it might go as high as or higher than 70. It is possible that it would indicate it was even less desirable material than 65-70. We find Shell paying the low of the Journal for 65-70 on that date. That does not appear on my chart as it is intermediate bracket material.

On June 27, 1935, Shell Company purchased from Cushing 10 cars of 65-67 octane. They paid 5⅝¢, which
2974 was the low of the Journal for 68-70 on that date.

I have a purchase of 15 cars on October 1, 1935, of 60-62 U. S. Motor straight run gasoline. It was third grade material. It was bought on a publication basis at the low of the Journal, date of shipment.

I have a transaction representing 2 purchases by Shell from Cushing of 15 cars on November 8, 1935 of 67 to 70 octane U. S. Motor. The price was 5⅝¢. The low of the Journal for regular gasoline on that date was the same price, 5⅝¢.

For December 20, 1935, I have a transaction representing a purchase by Shell from Cushing of 20 cars of 67-70 octane gasoline. That was purchased on a publication basis, based on the Chicago Journal of Commerce on the date of shipment. It wasn't a price which was the low of the Journal for the middle bracket; it was the low for the regular bracket. We made a check to find out what was the actual octane of that shipment, and we found that Cushing at that time was running their cracked gasoline around 65 to 67 octane. They made daily tests of it.

Q. And they were selling it to Shell at the low of the Chicago Journal of Commerce for a bracket which embraces 68-70?

A. Well, the price is based upon a bracket—I wouldn't say at that bracket.

2975 When you are buying intermediate bracket gasoline at a time that no publication publishes a quotation for that particular bracket, you have got to base it on some other bracket. If you are buying it on a publication basis, you must. There is no other way. They could have based it on the bracket, and bought it at ⅛¢ below, but it wasn't done in this case. It was done in the only way it could have been done. Well, it could have been purchased at ⅛¢ below the higher bracket, but instead of doing that, they purchased it at the low of the higher published bracket.

I haven't a transaction for January 7, 1936 between the 2 companies representing a purchase of 20 cars. I haven't one on the 8th, or on the 6th. I have one on January 7th for 10 cars. That was billed as middle bracket. It was sold at the low of the Journal for the regular bracket.

Q. Which is higher?

A. That is right,—well, when you say higher, there was no quotation for the middle bracket.

Q. I didn't ask you that, I asked you whether it wasn't a higher grade?

A. Well, it isn't higher than any quotation for the middle bracket, because there wasn't any.

I have a transaction between these two companies on January 25, 1936, involving 30 cars, third grade gasoline. That was purchased at the low of the Journal for 2976 third grade gasoline on the date of shipment.

I have on February 5, 1936, a transaction of 15 cars of U. S. Motor gasoline purchased by Shell from Cushing. That is third grade gasoline.

Q. Tell me whether it wasn't purchased at a premium over the low of the Chicago Journal of Commerce for that bracket of $6.60 a car?

A. I think that was a switching charge, Mr. Lewin. I don't think that was any premium.

Q. Well, at least, they paid a price which was $6.60 a car higher than the low of the Chicago Journal of Commerce, didn't they?

A. That I wouldn't be able to say. If there was such a thing as a switching charge, we wouldn't have noted it.

Q. Did you find the $6.60?

A. I don't recall. I know it was purchased at the low of the Chicago Journal of Commerce for third grade on the date of shipment.

For February 19, 1936, I have a transaction between these two companies, representing a purchase of 5 cars of U. S. Motor below 63 octane. That was purchased at the low of the Journal for third grade on the date of shipment.

On the same date, we have a transaction between these two companies of 20 cars of 65-70 octane. We examined to see just exactly what octane that gasoline rated. At that time, they were still running the 65 to 67 for cracked gasoline. This was 65 to 67 octane. The price paid was the low of the Chicago Journal of Commerce for regular grade gasoline of 68-70 as of the date of shipment. 2977

For March 6, 1936, I have a transaction involving 40 cars of third grade purchased by Shell from Cushing. They were bought on a publication basis, date of shipment, at the low of the Journal for third grade on the date of shipment.

For April 10, 1936, there is another transaction between these companies, representing a purchase by Shell from Cushing of 40 cars of U. S. Motor, straight run gasoline. That was purchased at the low of the Journal for third grade on date of shipment.

Q. Yes. Now, isn't it true that all the questions that I have asked you since lunch cover all of the purchases made by Shell from Cushing during the period of 1935 and the first 4 months of 1936, in addition to those 70 cars that you testified concerning this morning; and that appear on your chart?

A. I didn't check you on that. You would have to call them off again.

Q. I can give you the table from which I was working, and see if that doesn't embrace the entire transaction between these two companies during that portion of the conspiracy—of the indictment? 2978

A. Well, I will say this: That all of these that I have called off do not appear on that chart, for the reason, either they were bought on the publication basis, or because they are not regular or third grade material.

Q. And I haven't called off any transaction where the material was bought under the corresponding quotation, have I?

A. There is no corresponding quotation for middle bracket.

Q. Well, I ask you whether these transactions for the middle bracket are not all at the low for the higher bracket?

A. They are.

Q. Very well. And are there any there that are lower than the corresponding quotation?

A. No—no, again I disagree with you on "corresponding quotation."

Q. Very well. And have I covered all transactions between Cushing and Shell during that period of time, except these 70 you have mentioned here (indicating the chart)? I think I have covered
2979 all of the transactions, and if I have, isn't it true that the only transaction between these two so-called dancing partners that is under the quotations, the corresponding quotations, is this very first transaction here (indicating), that you pointed out to us on your chart?

A. No, I don't agree with that.

Q. And the reason you don't agree with it is because of this qualification you have made, is that right?

A. No. There were other purchases between Shell and Cushing made on the basis "f. o. b. Refinery," other than Oklahoma, which were bought under the corresponding low quotations; and I testified to that this morning. Now, they are on that chart, and they are not on this sheet.

Q. All right. I ask you again if this doesn't represent all the transactions between Cushing and Shell?

A. Subject to check.

Q. And isn't this one (indicating), the first one appearing on your chart, the only one where the price paid is below the corresponding Journal quotation, where there is a corresponding Journal quota-
2980 tion? And if it is the only one, it appears to be ⅛¢ under, is that right?

A. That particular one is ⅛¢ under, yes.

Q. And represents how many cars, did you say?

A. 10 cars.

Redirect Examination by Mr. Donovan.

I stated at the outset on direct examination that the transactions which Mr. Lewin asked me about, which were made on a publication basis, were not included in the chart.

When I speak of publication basis, to confine it to this examination here, I mean purchases that were made, based on quotations in the Chicago Journal of Commerce as of the date of shipment. By that I mean this: The buyer and the seller agree on a transaction involving so many cars. They do not agree on the price to be paid at the time but merely on a basis upon which that price is to be determined, in relation to quotations for a certain grade of gasoline as they appear in a certain trade journal on the date of shipment.

In this particular instance, it was confined to the Chicago Journal of Commerce. The price could not be determined until the Journal was issued, which showed the quotations that appeared on the date of shipment.

Now, as a matter of fact, that publication wouldn't be printed until the day following. The Chicago Journal of Commerce will come out, for instance, this morning, and will reflect quotations for regular and third grade gasoline on transactions and quotations of yesterday. So that, if a car was to be shipped today, and the price was based on publications, the buyer and the seller would not know until tomorrow what was going to be the price for that gasoline. 2981

That means that they merely agreed to abide by whatever price would be published in the paper for the date of shipment. So in such cases, since they agree to do it, the price paid must follow the price published in the Journal.

Many of these purchases were made by Shell and the origin of the shipment and the destination of the shipment were both Cushing, Oklahoma. Now, that might involve a switching charge from the refinery of Cushing to the destination around Cushing. It is in lieu of a freight charge; it is the same thing. Whether it is part of the purchase price would be a matter of agreement. It is not, as a rule. It is a transportation charge, as a rule, which is made by the railroad.

Recross Examination by Mr. Lewin.

Q. On June 1st, let us say, Shell makes a contract with Cushing to take 10 cars June 15th at the low of the Chicago Journal of Commerce. And on June 15th, Shell makes another contract to take from Cushing 15 cars on July 1st at the low of the Chicago Journal of Commerce, and so on throughout the rest of that year. I ask you whether those transactions don't prevent the gasoline covered by them from being sold by Cushing at a price lower than the Chicago Journal of Commerce? 2982

A. They do not.

The Court: Q. That is, they are there to be sold?

A. They are there to be sold, but—

Q. For delivery on a certain day? Cushing gets that much to sell on that day.

A. Not necessarily, no. Cushing can change its crude runs—

Q. Nevertheless, they have only so much to sell, and if they sell 1000 cars—

A. Their sales would be reduced, if they hadn't been made to Shell. But they might reduce their crude runs, so they still have the same amount of gasoline for sale.

Mr. Lewin: Q. Well, let me see if I can make it plain to you. If these transactions were not entered into the gasoline covered by them would be available for sale by Cushing to somebody else?

A. I don't agree with you on that, no. You 2983 must bear in mind refiners regulate their crude runs based on demand. We have had a lot of evidence in this case to illustrate that.

Q. Have you ever heard the term "surplus gasoline"?

A. Yes, indeed.

Q. Supposing the Shell Company bought all of the surplus gasoline manufactured by the Cushing Company in terms of the low of the Chicago Journal of Commerce on the date of delivery, date of shipment. Would that, in your opinion, have any effect on the market in preventing it from becoming depressed?

A. That could not be determined. It would be absolutely undeterminable.

Redirect Examination by Mr. Donovan.

I think the chart, Exhibit 889, was made for several purposes. It was to show, as one phase, that Shell was not paying a price which would lead the market upward, but it was also intended to show what they did pay on their flat price purchases with relation to published quotations. And it didn't include and didn't intend to include those paid at a publication basis for the reason I have already stated.

2984 *Direct Examination (Continued) by Mr. Donovan.*

We audited the sales acknowledgments, the invoices of all sales made at a flat price by Deep Rock Oil Corporation to jobbers and consumers of regular and third-grade gasoline over a period throughout 1935 and down to April 30, 1936. We included the purchase orders in that, if there were any. The invoices would show what the material was billed to the customer at, who the customer was, the grade of material furnished, and the f. o. b. point.

I have prepared a chart showing prices paid in flat-price sales of third-grade and regular gasoline by jobbers and consumers to Deep Rock Oil Corporation by its purchase orders, invoices, and acknowledgments, which I have described. This chart shows all those transactions, reflected by these documents, made at a flat price and limited to third-grade gasoline and regular-grade gasoline and further limited to those particular customers, jobbers and consumers.

There are transactions which have been eliminated. First, we had to eliminate certain materials. Deep Rock makes a premium leaded gasoline. That is what they call their Ethyl Kant-Nock, a trade name. That runs around 78 octane. That isn't regular grade gasoline. They also make a 60 to 62 gravity 400 endpoint gasoline, 2985 which ranges from 64 to 66 octane. That is neither regular grade nor third-grade. They also market what is known as "fighting grade aviation" gasoline. We eliminated that. They also make a domestic grade aviation gasoline. They produce a 68 to 70 gravity 350 endpoint gasoline. They produce still another odd type of material. That is 64 to 66 gravity, 390 endpoint. Now, there are 6 different types of gasoline that are marketed by Deep Rock, which cannot be classified as either regular grade, or third-grade, and which we have eliminated.

There were other eliminations. Of course, as I stated before, this is limited to consumers and jobbers. As to consumers, we eliminated the municipalities, states, and other political subdivisions, because it is our understanding that the publications do not reflect sales of that type. That is, they try to get down to what may be called industrial consumers.

There were other eliminations. Deep Rock sells to some jobbers and consumers on a contract basis, or under contract. Some of them are sold pursuant to oral agree-

ments. Some are sold on a publication basis; and under publication basis we might include some that are sold under what is called the sellers' spot market, date of shipment. We eliminated that type of sale because it is not a flat price transaction. It is not what you would call a spot open market sale. At the time the order was
2986 placed you could not compare it because you would not know what the purchase price was going to be. You would not know that until the date of shipment.

We did not make any other elimination. These shipments were made on the basis of f. o. b. refinery, and the Deep Rock refinery is located in Cushing, Oklahoma. That is equivalent to f. o. b. Group 3. My chart shows a comparison with the prices in Platt's Oilgram for the Oklahoma refinery market and the Chicago Journal of Commerce.

(Chart referred to marked Exhibit 890 for identification.)

This chart shows only the sales to jobbers and consumers on a flat price basis.

First of all, it will be noted that the chart covers a period throughout 1935 and the first 4 months of 1936. This is the same type of chart as we have been using heretofore.

There are two different types of markings on this chart. Some of them are dots and others are crosses. The crosses are put on there to indicate a consumer customer. The dots are the jobber sales. They are by far the more numerous.

These numbers appearing under the dots indicate the number of transactions on that particular date at that same price, if there were more than one. If there is no number under the dot it means there was one sales
2987 transaction on that particular day at that price.

The dots represent purchases by jobbers in the spot market. The blue dots are third grade, and the black dots on the upper range are regular grade.

There is a very large number of purchases by jobbers at the high of the 63-70 octane bracket; the so-called regular bracket. They predominate. Those were the prices paid by jobbers at the high of that bracket in the spot market. The purchase orders and invoices supporting those sales showed the price.

There are two types of regular grade gasoline sold by Deep Rock. One is a leaded gasoline, 68 to 70 octane, going under the trade name of Super Kant-Nock, "Q" indicates a leaded gas in the trade. There is also another type of regular gasoline that is billed as 67-70 octane but that averages about 68.5 octane; it is consistently over 68. That appears on what the company calls monthly analytical reports, which show the octane test of every tank car of gasoline as the tank is filled. The actual octane rating of that gasoline was higher than 67 octane; that always ran 68 or higher.

There were 334 sales of third grade to jobbers and consumers in the entire period in that spot market at a flat price basis. And of those there were 14 made above the high; 79 at the high; 31 within the range, that is 2988 between the composite high and the composite low of the two trade publications. There were 168 at the low; and 42 below the low.

I can give that comparison in terms of percentage of transactions. Those made above the high were about 4%; those at the high, about 24%; those within the range, 9%; those at the low, 50%, and those below the low, about 12½%.

There were just 34 transactions in third grade in January and February, 1935. Of those, 3 were made above the high; 2, at the high; 7, within the range; 11, at the low; and 11, below the low.

In percentage, there were about 9% made above the high; 6%, at the high; 21%, within the range; 32%, at the low, and 32% below the low.

During the next 3 months of 1935, when the market was rising, March, April and May, there were 98 such transactions of which 4 were made above the high; 14, at the high; 13, within the range; 52, at the low, and 15, below the low.

In percentages, about 4% were made above the high; 14%, at the high; 13%, within the range; 53%, at the low; and 15%, below the low.

That was all for jobbers and consumers, of purchases by them, of third grade gasoline, on the spot market, during that period when the market was rising.

2989 As to the sales to jobbers and consumers of regular gasoline, there were 39 transactions in that first two-month period of 1935; and of those, 4 were made above the high; 12, at the high; 15, within the range; 8, at the low; and none, below the low.

In per cent, 10% was made above the high; 31%, at the high; 38% within the range; 20%, at the low, and none below the low.

In March, April and May, when the market was rising, there were 51 such sales, of which 6 were made above the high; 27, at the high; 10, within the range; 3, at the low; and 5, below the low.

In per cent, there were 12% above the high; 53% at the high; 20% within the range; 6% at the low; and 10% below the low.

Regular grade: There were 241 such sales in the whole period of which 11 were made above the high; 153, at the high; 40, within the range; 27, at the low, and 10, below the low.

In per cent: That would be 5% above the high; 63% at the high; 17% within the range; 11% at the low; and 4% below the low.

That covers the entire calendar year of 1935; and the first 4 months of 1936.

None of the sales that are shown on that chart there
before the jury, and which I have been talking
2990 about, were sales made to major oil companies. They
were exclusively to jobbers and consumers.

(Chart previously so marked for identification, is received in evidence as EXHIBIT 890.)

(Chart previously so marked for identification, is received in evidence as EXHIBIT 889.)

I have a copy of Exhibits 750 and 751. They were put in at a time when a group of exhibits were put in, numbering 747 to 751, inclusive. They were put in by Mr. W. J. Miller, the accountant for the Government. Exhibits 750 and 751 were preceded by 747, 748, and 749.

Exhibit 747 doesn't deal with price at all. It shows the volume of purchases by the defendant majors; and it divides that volume of purchasing into the fields in which the purchases were made; that is, the East Texas field and the Mid-Continent field. It also divides those purchases as to the month in which they were made.

Those purchases are set forth in tank cars, not gallons. They are limited to third grade material and regular grade gasoline. The period covered is a 14 months period, from March 1, 1935, to April 30, 1936. It includes all defendant majors with the exception of Sinclair.

These Exhibits include 6 defendant majors against
2991 which the indictment has been dismissed. They are
Cities Service Export Oil Company, Louisiana Oil Refining Corporation, Gulf Refining Company, Tide Water Oil Company, The Texas Company, and Deep Rock Oil Corporation.

Exhibits 748 and 749 then deal with price comparisons of these purchases, which were made only in the East Texas field. They have a segregation also as to which of these purchases were made at a specific price, that is, a flat price; and they also show which of these purchases were made on a publication basis.

Exhibit 748 makes the price comparison with the low of Platt's Oilgram quotations; not the range, not the high, but the low of the Oilgram.

The testimony in this case at the time these exhibits were introduced was that the Oilgram quotation that was utilized in Exhibit 748 was the East Texas refinery market, that is, f. o. b. Refinery, East Texas.

Exhibit 749 makes a similar price comparison of these same purchases made in the East Texas field with Chicago Journal of Commerce low quotations which are on an f. o. b. Group 3 basis, not on f. o. b. Refinery at all.

As I have explained, Exhibits 748 and 749 deal with the purchases in East Texas. Exhibits 750 and 751 deal with purchases made in the Mid-Continent field.

Exhibit 750 makes a price comparison with the quo-
2992 tations contained in Platt's Oilgram; but, here, the
Oilgram quotations used are f. o. b. Oklahoma refinery. These purchases made in the Mid-Continent field will include purchases made out of such refinery districts as Oklahoma, so that any comparison with the Oilgram, Oklahoma refinery quotations, is quite correct. But these purchases also come out of the North Texas refinery district, the Kansas refinery district, the Louisiana and Arkansas refinery district and West Texas.

Now, these refineries from which these purchases were made are scattered all over that area; but the comparison is made here with Oilgram quotations for the Oklahoma refinery market.

Passing on to Exhibit 751. There, the price comparison is made with the Chicago Journal of Commerce, which is on a strictly Group 3 basis, which means Oklahoma.

Exhibit 750 shows how many of these tank cars were purchased above the low of the Oilgram for the Oklahoma refinery market, and, if above the low, at what fraction of a cent above it. It shows how many were purchased at the low. It shows how many were purchased below the low, and, if below the low, at what fraction of a cent below it. It also shows the purchases made on a publication basis, as distinguished from those made on a flat price basis. It

shows which major made the purchases, and at a specified price; and it shows percentages then, as to how 2993
many were bought at various prices, above the low, and at the low, and below the low.

I have made a study of the accuracy of these Exhibits 750 and 751 in respect to various things: In respect to the price, to the type of material, to the f. o. b. point, to the origin of the material, and to the type of the supplier. Our study was confined to those cars shown on these Exhibits 750 and 751 to have been bought above the low. We found ourselves unable to identify these purchases as they appear in these exhibits. The result was that Government counsel was asked for a list of those purchases shown in these Exhibits to have been made above the low and at the low. They gave us a list only of those above the low. To have included those made at the low would have been a tremendous job, so the thing was confined to those above the low.

Those lists show the name of the major that did the buying; the source of supply; the independent refiner or the broker that supplied the material, that is, it gave the seller as well as the buyer. It gave the month in which the purchase was made. It gave the number of cars. It didn't give the price, but it gave the fraction in cents of the price that was over the respective publication low.

We went to the impounded records in checking the 2994 accuracy of this Exhibit. Those are invoices, purchase orders, confirmations; you may have distillation sheets in some instances. There might be shipping instructions. In a few instances, we had to go beyond that. There are two majors that didn't always have purchase orders, so that you won't find the purchase orders in the impounded records. So, we had to go to our own audits to find out the date of the purchases of a few of these majors.

When we got these records, we checked the accuracy of what was stated on these lists furnished by Government counsel, as to whether or not they were purchased above the low; whether they were purchased from independent refiners; whether the material was third grade gasoline or regular grade gasoline; whether the material did come out of the Mid-Continent field; whether it was purchased at that particular amount over the publication low; and whether that particular publication was a proper comparison of this particular purchase transaction.

Exhibits 750 and 751 classify or attempt to classify purchases on the basis of whether they were made at a flat price or a price based on one of the trade publication quotations on the date of shipment. That is another thing that we checked, to see whether that was accurately computed and determined.

In studying the accuracy of these Exhibits, I have
2995 examined into all the purchases made during 1935 and
1936 by the defendant majors. For this purpose I ignored those 6 major companies which were originally defendants, and are no longer in the case.

The chart, Exhibit 750, shows 674 cars were purchased at a price higher than the low of Platt's Oilgram for the Oklahoma Refinery market, excluding the 6 companies no longer in the case. There were 71 cars in addition that were purchased by those 6 companies. I made no study of those 71 cars.

There were 92 purchases above the low of the Chicago Journal of Commerce by these companies that are no longer defendants and of which I made no study. I confined my examination to the 892 shown to have been bought over the low of the Journal in connection with the defendants still in the case.

There were 10 companies whose purchases I did study in connection with Exhibit 750. Listing them as 10 companies, I count Wadhams as a separate entity, but I include the 3 Globe companies as one entity.

This Exhibit does not show that Standard of Indiana bought any cars over the low of the Oilgram out of the Mid-Continent field. It doesn't show any with respect to Shell. So I didn't study anything in regard to Indiana or Shell.

In regard to Exhibit 751, I studied 11 companies.
2996 We excluded Shell, but we included Standard of Indiana, because this Exhibit shows that it purchased 25 cars over the low of the Journal during this 14 months period.

Exhibit 750 shows that Barnsdall bought 121 cars over the low. Now, that comparison and determination is correct with respect to just 32 out of the 121 cars. 32 out of the 121 were correctly compared and actually bought over the low.

Mr. Chaffetz: Q. I would like to know what the witness means when he says "correctly". Does he mean that all of the others, except 32, were not, as this Exhibit shows, bought at prices that were above the low of Platt's Oilgram?

The Witness: I will explain that. 86 out of these 121 cars were bought on publication basis; they were not bought on flat price basis at all.

Mr. Chaffetz: In your opinion.

The Witness: I know they weren't.

The Court: Q. How do you know? Just produce the records that you ascertained that fact from.

The Witness: The invoices, first of all, put you on notice of that. You will find that most of the prices here are figured in sixteenths. The common practice in the oil industry is to buy on fractions of 2997 an eighth. That put me on notice that there was something unusual about these transactions, and I checked into it and I found they were bought on the basis of the average of Chicago Journal of Commerce quotations, plus ⅛¢ or plus ¼¢. They were also bought f. o. b. refinery in Arkansas; so that they were not bought f. o. b. Group Three at all. They were not bought on an Oklahoma refinery basis. That is true with respect to 86 out of the 121 cars.

Q. What difference did that make, that you have just described?

A. The price comparison would not be correct, or proper, to compare this purchase price on purchases made f. o. b. refinery in Arkansas with quotations for f. o. b. Oklahoma refinery, because of the freight differential.

Mr. Lewin: Q. So you compared it with something else then?

The Witness: I made no comparison.

Mr. Chaffetz: Q. What you mean is you went back to Barnsdall Company and got some purchase orders that were not in the Clerk's files here and you checked with those records.

A. I didn't get the purchase orders.

The Court: Q. Did you make a check from any other records except those here in the Clerk's office?

2998 A. In this particular instance, I did, because there were no purchase orders covering these particular invoices. This is one of the few audits we know that was made in the Barnsdall office last summer. When we saw these audit prices we went to the Chief Accountant for Barnsdall and asked him how they were accounted for. They showed us their computation as to checking the invoices, and they showed us just—that they were bought on publication basis, and showed how they were figured.

These purchases were all made from one independent refiner in Arkansas that furnishes their requirements for that particular area in a freight differential territory. All shipments were made, I think, to Missouri and Arkansas and possibly Louisiana.

Mr. Chaffetz: Q. You do know, as a fact, that the Barnsdall Company didn't submit its purchase orders, as the other companies did, in response to the subpoena?

A. That I don't know, Mr. Chaffetz, but I know on these particular purchases there were no purchase orders at all; because the arrangement with this supplier is that they send requisitions for their requirements in that particular area. I don't think there ever were purchase orders on these particular 2999 transactions. That is a frequent practice where you are buying in a freight differential territory.

The Court: Q. Did you find any Barnsdall purchase orders in the records in the Clerk's custody?

A. I wouldn't be able to say—all of their transactions. I know there are none in connection with these transactions.

Mr. Chaffetz: That is all.

By Mr. Donovan

While I have Barnsdall right here in front of me, I might finish it. There are 4 cars in here that are not motor fuel at all; and they were furthermore f. o. b. purchases from a broker rather than an independent refiner.

Then there are quite a few clerical errors. I won't go into all the details, but it means a net overstatement of 1 car. That brings us down to 32 cars. There are 32 of those cars which the Government includes in here as having been purchased over the low that were correctly compared and purchased over the low.

In relation to Western Oil & Fuel Company, I found they were a broker. They supplied 1 car. That car, incidentally, was special endpoint material.

I found other mistakes, such as that there are 3 more cars here; for instance, a car of natural gasoline. Natural gasoline is not a motor fuel. It is 3000 used for blending purposes in the manufacture of gasoline, but it is not a motor fuel in itself. There are quotations carried in the publications for that kind of material. When natural gasoline is sold to a refiner it is purchased for blending purposes. If it is sold to a jobber—it is a special kind of natural gasoline that is used for fuel purposes, or lighting purposes, and not used as a motor fuel and they should not have been compared with third grade.

Mr. Chaffetz: Q. How many cars did you say of that, talking about that?

A. Talking about 4 cars.

By Mr. Donovan

Exhibits 750 and 751 show that the Government claims the Continental Oil Company bought 9 cars at a price above the low of Platt's Oilgram and Chicago Journal of Commerce. There are 6 of them shown to have been purchased in April, 1935; 1 in March, 1935; 2 in May, 1935.

The Government claims that 7 of them were purchased from Dickey Oil and Refining Company. Those were bought in March and April, 1935; and 2 more from Taxman Refining Company in May, 1935. I looked at the records of Continental to see whether that was a fact. As a matter of fact, Continental didn't purchase any cars from Dickey in April, 1935, but in this particular instance the Government list gives the invoice numbers, so we
3001 checked those invoice numbers, and we found that
6 of those had been purchased from Dickey, but the purchaser was not Continental Oil Company, it was Phillips Petroleum Company.

The May purchase was from Taxman. The Taxman refinery is down in the North Texas refinery district, and these cars were bought on an f. o. b. refinery basis, so that the purchase price here is not comparable with the Oilgram quotations on Oklahoma refinery district. 1 car was purchased at 4¾¢. That one was purchased f. o. b. refinery. Now, there was another car purchased that was purchased on a Group 3 basis. That was purchased at 4¾¢.

I was wrong when I said the 2 were purchased f. o. b. refinery. 1 was purchased Group 3 and 1 was purchased f. o. b. refinery. The one purchased f. o. b. refinery was on May 29, 1935, and the one purchased on Group 3 basis was May 31, 1935. The Oilgram for the Oklahoma refinery market on May 31 had a low of 4¾¢, which is the same as the purchase price. It had been at that price since May 15. These purchases were claimed to have been bought above the low, and they were bought at the low of the Oilgram, Oklahoma refinery market.

On Continental, of course, what I said with respect to

6 cars purchased by Phillips is equally applicable
3002 to Exhibit 751 in comparison with the Journal prices.
That is, they were not purchased by Continental.

There is 1 car here shown to have been purchased from Dickey on March 15th at ⅛¢ over the Chicago Journal of Commerce low. That is incorrect, because the car wa[illegible] bought on an f. o. b. Kansas refinery basis. You can[illegible] compare a price paid f. o. b. refinery out of Kansas with a Group 3 price, because Kansas is so much nearer the consuming market that it enjoys a freight differential of about ¼¢ over Oklahoma refineries.

Then, of course, we have this other car here bought from Taxman. That was bought f. o. b. North Texas refinery basis, so that you can't compare that price with f. o. b. Group 3 prices.

There are 4 cars claimed to have been bought by Wadhams over the low of both publications. According to the Government list, 1 car was purchased from Danciger in August, 1935. 3 other cars were purchased from Danciger, 2 of them in June and 1 in July.

The 3 cars grouped together as having been purchased in June and July were third-grade, although they were 62 octane guaranteed. Nevertheless, I would call that third-grade gasoline. The other car bought in August was neither third-grade nor regular grade. That was 63 octane guaranteed.

Mr. Chaffetz: Q. May I ask do you draw a
3003 distinction between 63 and 62? You think 62 is third-grade and 63 is not?

A. If the purchase order would specify 63 octane or 63 octane guaranteed, it wouldn't be third-grade gasoline. If the customer was ordering third-grade gasoline, and if the distillation report might show it was 63 octane, I would still consider that a third-grade transaction.

By Mr. Donovan

The 3 cars of third-grade were an unusual specification. The other wasn't third-grade. That 1 car was not third-grade. It was improperly included and the price was not properly compared with third-grade.

Exhibit 750 shows 39 cars to have been bought by the various divisions of Socony-Vacuum Company at various prices over the low of Platt's Oilgram. 5 cars at ¼¢ over the low and 34 cars at ⅛¢ over the low.

Exhibit 751 shows 44 cars to have been bought over the low of the Chicago Journal of Commerce, 5 cars ¼¢ over, and 39 cars ⅛¢ over.

The 5 cars at ¼¢ above were bought by the White Eagle Division from Champlin Refining Company in July, 1935, at 5¢ f. o. b. Hutchinson, Kansas. They were not bought on Group 3 basis or Oklahoma refinery basis. These cars weren't properly classified.

3004 I might say this: The Champlin refinery is in Oklahoma, but it has a pipe line running up to Superior, Nebraska, and that pipe line can be tapped in at Hutchinson, Kansas. The sales were made to the White Eagle Division which is up around there, and on a basis, f. o. b. Hutchinson, Kansas. So you can't make a comparison on an f. o. b. Group 3 basis or an Oklahoma refinery basis, because the freight differential is about ¼¢.

I think that the Oilgram for the Kansas refinery market quoted 5¢ at that time, July 5, 1935, which is the purchase price, as the low. So it would have been bought at the low of the market and not above the low.

I have run across a number of other instances where the price was improperly compared. The White Eagle Division made another purchase from Dickey Oil & Refining Company of 10 cars. Dickey Oil & Refining Company is an independent refinery located at McPherson, Kansas, and these cars were bought on f. o. b. McPherson, Kansas basis. That is f. o. b. refinery. So there, again, you have got an improper comparison of the purchase price with Group 3 and Oklahoma refinery quotations. The exhibit claims purchases made at a price above the publications, when, if the comparisons were made with the proper market, it would be found they were below, because the purchase price here was 5⅛¢ f. o. b. Kansas, and Platt's Oilgram for the Kansas refinery market had a low at that time of 5¼¢.

3005 I found other inaccuracies in Exhibit 750 with respect to Socony-Vacuum. It bought 20 cars from Taxman Refining Company. These were bought in February, March and April, 1936. The Government showed them to have been purchased at ⅛¢ over the low of the Oilgram for the Oklahoma refinery market. 1 of those cars was bought at 5⅛¢. That was the low of the Oilgram on the date of purchase. So that it was not bought at above the low of the Oilgram.

The Government shows 39 cars to have been bought above the low of Platt's Oilgram. I am talking now about Socony-Vacuum, the various divisions. This hasn't anything to do with Wadhams. Of those 39 there are only 23 that are correctly compared. They were actually bought over the low.

As to Chicago Journal of Commerce, the Government showed 44 cars to have been purchased over the low, and of those 29 were properly compared and were bought over the low.

Socony-Vacuum Company, exclusive of Wadhams, bought 364 cars out of the Mid-Continent field, according to Exhibit 750, at a specified price. Wadhams, according to the Exhibit, bought 165 cars at a specified price out of the Mid-Continent field. That is an aggregate for the two of 529 cars on a flat price basis. There were actually 26 of them bought over the low of Platt's Oilgram.

3006 The percentage on those figures I have just described would be about 5% of the total purchases at a specified price as compared with the Oilgram.

There would be 32 of them that are correctly compared and were bought over the low of the Chicago Journal of Commerce. That would be about 6%.

Exhibits 750 and 751 show purchases below the low, as far as I know.

Exhibit 750 shows that Socony-Vacuum bought 98 cars below the low and Wadhams 107 cars below the low. That is a total of 205 cars bought by both of them, according to this Exhibit, below the low of Platt's Oilgram.

It would not be true that 10 of the cars classified above the low should have been classified as below the low, if you are confining yourself to the Oilgram for the Oklahoma refinery market. Those 10 cars were bought below the low of the Oilgram for the Kansas refinery market. There may be a great number of those that are classified in this exhibit as bought at the low, which would really be bought under the low if properly compared with the Oilgram refinery market.

(Document previously so marked for identification is received in evidence as Exhibit 997.)

205 is the number of cars which the Government admits were bought below the low of the Oilgram by Socony.

3007 I do not believe I gave the figures as to the number bought below the low of the Chicago Journal of Commerce. Those were 95 for Socony-Vacuum and 72 for Wadhams, a total of 167 cars.

Socony-Vacuum and Wadhams never bought a car over the low of a publication when they bought on a publication basis, and they bought a large number of cars on a publication basis below the low of the publication.

I would like to point out one thing, in connection with that. The White Eagle division bought 20 cars from Champlin at the low of the Journal plus ⅜¢, but they bought that on a basis of f. o. b. Hutchinson, Kansas, so that making the proper comparison with the Chicago Journal of Commerce, that is group 3, it can be said that neither Socony-Vacuum nor Wadhams ever bought a car on a publication basis over the low of the publication.

As to an over-all computation of the amount bought at, above and below the low by these companies for which Jacobi purchased, I can say this: That for every car bought over the low, there were about 20 cars bought under the low. I haven't made any more detailed comparison than that. I haven't worked out the percentages.

Exhibits 750 and 751 do not show correctly the amounts purchased by Skelly Oil Company at prices above the low of the Oilgram and the Journal. I found errors
3008 there.

There are 3 cars shown to have been bought over the low of the Oilgram in Exhibit 750. These are shown to have been bought at a specified price. As a matter of fact, they were bought on a publication basis. That is true also with respect to Exhibit 751, which makes a comparison with the Journal.

Now, there are other errors, too. There are 11 cars shown on Exhibit 750 to have been bought over the low of the Oilgram. Now, those cars were bought on January 11, 1936, and the Oilgram wasn't even published on January 11, 1936.

Then there is another error in price comparison. There is 1 car shown to have been purchased above the low. As a matter of fact, it was bought at the low of the Oilgram, but it is shown in this exhibit, in the Government list, to have been bought above the low. The Rock Island Refining Company shipment on January 3rd is the one that was shown to have been bought over the low, and it was actually bought at the low. That car was ordered on January 3, 1936. On January 14th, that was following the advance in crude, there was a price adjustment, and the price was advanced ½¢; but that price was in agreement with the low of the Oilgram on that date.

There were no cars which the Government listed
3009 as having been purchased by Skelly at a price above
the low of the Journal, purchased during March, April, or May, 1935, insofar as a comparison with the Oilgram is concerned. There were 2 cars purchased in April, 1935, which were bought over the low of

the Journal on the date of purchase. Those involved a local destination.

Exhibit 750 shows Skelly to have bought 30 cars at a specified price over the low of the Oilgram on the date of the order. As a matter of fact, only 15 of those cars were bought over the low of the Oilgram on the date of the order.

Exhibit 751 shows that, out of a total of 643 cars bought at a specified price in the Mid-Continent field, 32 were bought over the low of the Journal. As a matter of fact, there were 29.

As far as the Oilgram is concerned, there were just a little over 2% of the total cars purchased by Skelly in the Mid-Continent field at a specified price that were bought over the low of Platt's Oilgram.

As to the comparison with the Chicago Journal of Commerce, there were less than 5% bought by Skelly over the low.

Exhibit 750 shows that Skelly, out of a total of 643 purchases at a flat price in the Mid-Continent field, bought
122 of those below the low of the Oilgram. That
3010 would be more than ⅕. It shows 30 above; but, as
I stated, only 15 of those are correctly determined.

Purchases below the low of the Journal are shown on Exhibit 751. That shows that out of the 643 cars, 107 were bought under the low of the Journal. That would be about ⅙, which is around 16% or 17%.

Exhibits 750 and 751 are not correct in regard to Pure Oil Company. Exhibit 750 shows that, out of a total of 584 cars purchased in the Mid-Continent field at a flat price, 101 were purchased over the low of the Oilgram on the date of purchase.

Exhibit 751 shows that, out of that same number of cars purchased in the Mid-Continent field at a flat price, 100 were purchased over the low of the Chicago Journal of Commerce on the date of the purchase.

Going back to Exhibit 750, out of that 101 cars shown to have been purchased over the low, 16 cars are not motor fuel, but illuminating gasoline. 4 more cars were not bought at a flat price at all but on the publication basis. Then there are 21 cars in which an error was made in comparing the purchase price with the publication low on the date of purchase. Then there is still another error of 1 car as to the number of cars involved in the transaction. So that, taking all those into account, there are 59 cars, and not 101, that were bought over the low of Platt's Oilgram.

3011 Going back to the Journal, the comparison on Exhibit 751, we have those same 16 cars that are not motor fuel, but illuminating gasoline. There is an error in the comparison of the purchase price with the low of the Journal on the date of the purchase with respect to 14 cars. And there is also that other error as to the number of cars, amounting to 1 car. So that there are 69 out of the 100 that were correctly compared and found to be over the low of the Chicago Journal of Commerce.

The mistakes I have just described are not the only ones I found in regard to those purchases. There are 7 cars shown on Exhibit 751 to have been purchased at ½¢ over the Journal low. As a matter of fact, they were purchased over the low of the Journal, but the excess was not ½¢, but only ⅛¢.

Then there are 25 cars shown on Exhibit 751 to have been purchased at ¼¢ over the low of the Chicago Journal of Commerce. They were purchased over the low of the Journal but the margin was just ⅛¢, not ¼¢.

Out of these 101 cars, 42 were wrongly classified in Exhibit 750. That would be just about 42%.

In Exhibit 751 about 63% were wrong. In about 63% of the 100 cars, there are errors in the determination.

I don't recall finding any more errors, But we did find that of the 62 cars purchased ⅛¢ over the low, in fact, all of these cars that were really purchased over
3012 the low of the publications were of unusual specifications. They called for 70 to 71 octane. That is, there were 59 cars that were purchased over the low of Platt's Oilgram and 69 cars purchased over the low of the Chicago Journal of Commerce, and all of them were regular grade gasoline of unusual specifications, that is 70-71 octane.

None of those cars that were bought above the low was bought above the market.

Purchases were being made above the high of the market range by jobbers in 1935 and in 1936.

Confining myself to Exhibit 750, which makes a comparison with Platt's Oilgram, out of the 59 cars bought by Pure over the low, there were 4 cars bought in April, 1935. The remaining 55 were bought in March, 1936. Of the 69 cars which were bought over the low of the Journal, which comparison is shown in Exhibit 751, just 7 cars were bought in that three months period when the price was arising, that is, in March, April and May, 1935. The remainder were all bought in 1936.

Empire Oil & Refining Company was not one of those cases in which the number of cars bought above the low was stated correctly in Exhibit 750. Exhibit 750 shows that Empire bought 756 cars in the Mid-Continent field at a flat price; and it shows that of the 756 cars, 82 were purchased over the low of the Oilgram on the date of 3013 purchase. Of those 82 we found that 5 were not purchased in the Mid-Continent field, but in what we call the Gulf Coast, that is, the lower part of Texas. They came from Wood-Moore Corporation, which has a refinery down at Port LaVaca. They were bought on a publication basis, and not at a flat price.

Then, there are 37 additional cars out of the 82 that were bought on an f. o. b. refinery North Texas basis; so that the purchase price is not comparable with the Oilgram for the Oklahoma refinery market, because there will frequently be a difference in the price quoted by the Oilgram for the North Texas refinery market and the Oklahoma refinery market. The price in North Texas may be either higher or it may be lower. As a matter of fact, today it happens to be ½¢ higher than the Oklahoma refinery market. There can be a considerable variation there.

There is still another error in respect to Exhibit 750. There is an error in the price comparison of 7 more cars, so that instead of there being 82 cars purchased over the low of the Oilgram, there are only 33 that are properly compared and were really purchased over the low.

Going to Exhibit 751, we have not 5 cars purchased from Wood-Moore Corporation, which is outside of the Mid-Continent area, but 6 cars. And there are not 3014 37 cars, purchased f. o. b. North Texas refinery, but 42 cars. So that out of the 102 cars shown on Exhibit 751 to have been purchased in the Mid-Continent field at a price over the low of the Journal there are actually 54 cars.

Exhibit 751 shows that Globe bought a total of 289 cars in the Mid-Continent field at a flat price, and out of that number 33 cars were bought over the low of the Journal. Exhibit 750 shows that 32 cars were bought over the low of the Oilgram.

Exhibit 750 shows that Globe bought 245 cars below the low of Platt's Oilgram.

Exhibit 751 shows that it bought 226 cars below the low of the Journal.

I find there were mistakes made in the classification of the cars bought above the low. As far as a comparison with the Oilgram is concerned, 11 out of the 32 cars shown to have been bought over the low were bought on a publication basis, not at a flat price.

The f.o.b. point was Kansas on 5 cars; and then there was an error in price. There was 1 car shown to have been bought above the low of the Oilgram that was actually bought ⅛¢ under the low; that purchase was made March 13, 1935. It was bought at 4½¢. The Oilgram on March 13th has a low of 4⅝¢.

Those are all the mistakes with respect to the Oilgram, but with respect to the Journal there was the same
3015 mistake in connection with the 11 cars purchased on
a publication basis. There was the same mistake in connection with the comparison of the purchase price with the low of the publication on March 13, 1935 of this 1 car that I was just talking about; and then there were 6 cars purchased f. o. b. refinery in Kansas, that were improperly compared with the Journal Group 3 quotations.

Out of these 32 cars shown to be purchased by Globe over the Oilgram low, Exhibit 750 is correct with respect to 15.

Exhibit 751 shows 33 cars to have been purchased over the Journal low and there, again, it is correct with respect to 15.

The total cars bought by Globe at a specified price in the Mid-Continent field was 289 so that these 15 cars would represent about 5% of the total. Of course, we made no study of those bought at the low. Exhibit 750 shows that 13 cars were bought at the low of the Oilgram, and Exhibit 751 shows 30 cars to have been bought at the low of the Journal. Exhibit 750 shows that 244 out of the 289 were bought below the low.

I have made an examination of the accuracy of Exhibits 750 and 751 insofar as they relate to purchases at specified prices above the low by Phillips Company. I found inaccuracies.

3016 Exhibit 750 shows that Phillips bought at a flat price in the Mid-Continent field a total of 1313 cars. 218 of those are shown to have been bought at various prices over the low of Platt's Oilgram quotations.

Of those 218 cars there were 87 that were bought on a publication basis and not on a flat price basis at all. There were 51 that were bought on a refinery basis other than Oklahoma, so that the purchase price was not properly compared with Oklahoma refinery quotations.

Then in addition to that we found a lot of clerical errors. For instance, there is an error in summarizing the detail amounting to 7 cars. There is a duplication on the list; 4 cars were taken into account twice.

There is an error in the price comparison as to a large number of those cars. There are 31 cars in which the purchase price was erroneously compared with the low quotation of the Oilgram on the date of the order. As a matter of fact those were bought at ⅛¢ under the low instead of ⅛¢ over the low. Then there is still another car that is shown to have been bought over the low that was bought at the low.

Those errors net 29 in number, so that out of the 218 cars shown on Exhibit 750 to have been bought above the low, only 51 of those properly compared were actually bought over the low of the Oilgram.

3017 When I talk about purchases on the basis of published prices, in the case of Phillips we got our information in connection with the audit of the independent refineries. Phillips' files were not complete as to purchase orders, so when we were making our audit of the independent refiners we went a step further and audited the sales of the independent refiners to Phillips. We did not use material that was on file here in the Clerk's office. We used material that the government accountants did not have access to.

I have mentioned those instances before. After this I will volunteer it. But let me say now that with Phillips and Continental the files are incomplete as to purchase orders, and that goes for any of my testimony.

Barnsdall was incomplete in some respects. Whether it is entirely incomplete as to purchase orders I would not be able to say offhand. We did get access to purchase orders as to Continental and Phillips.

There were impounded here documents from independent refiners of their purchases, and their invoices. The impounded records include records from the majors' files, and also records from the independents' files insofar as their transactions with the majors are concerned.

I did not use the impounded records of the independents for Phillips and Continental. I went outside to get those.

3018 I think that some of those purchase orders of Phillips and Continental were in the independent files that were impounded here. I'm not sure.

I can tell the number of cars that were bought by Phillips on an f. o. b. Kansas basis. There is 1 car bought from Dickey, March 11, 1935, f. o. b. McPherson, Kansas. In fact all purchases from Dickey were f. o. b. refinery, Kansas. There is a very large number of those. That is, practically all of them that were bought on a refinery basis other than Oklahoma, as a generality. There were 21 cars bought from Dickey, and in addition to that there was another car bought from Western Refining Company which is located at Chase, Kansas. That was bought on an f. o. b. refinery basis. 1 of the cars obtained from Dickey was bought in March, 1935; 20 in March, 1935. Then there are 20 that were bought in April from Dickey in addition to the 21 I just named. Then there were 4 more in March, 1935. There were 5 cars in March, 1935. There were 45 cars in June, 1935. There were 12 in July, 1935; there were 4 more in July, 1935; 5 in September; 2 in February, 1936. There is a total of 106 cars from Dickey. Now, I only testified as to 51 having been bought on a refinery basis other than Oklahoma. Some of those cars that were bought on the publication basis were also bought from Dickey, and there were 87 of those.

3019 All 106 were bought on an f. o. b. refinery basis, and a large number of them also were bought on a publication basis.

The fact that it was bought on an f. o. b. refinery basis, f. o. b. Kansas, would appear on the face of the invoices impounded here in the Clerk's office.

If the proper comparison had been made, in relation to the quotations in the market where they were bought, instead of some other market, instead of there being 218 cars bought over the low of the Oilgram, there would be only 51. And, instead of there being 288 cars over the low of the Journal, as shown on Exhibit 751, there would also be 51.

Some of those cars would have been classified as below the low if they had been compared with the Oilgram for the Kansas refinery market. That is the market where the purchases were made.

I started to say there were other Kansas refiners from whom purchases were made. I mentioned Western Refining Company. There is Kanotex Refining Company in Kansas, from which 1 car was bought on an f. o. b. refinery basis. Then there were some purchases from North Texas refineries on a refinery basis.

I found other inaccuracies in Exhibits 750 and 751, insofar as they related to Phillips' purchases at a specified price. Exhibit 750 contains 41 cars which are erroneously classified as to the month in which they were pur-
3020 chased. That is true also with respect to Exhibit 751.

A purchase from Taxman Refining Company on February 1, 1936 was bought f. o. b. refinery. The refinery is located in the North Texas refinery district so it is improperly compared with the Oklahoma refinery market in the Oilgram, and also with the Journal Group 3 quotations.

12 cars were purchased from Taxman in 1936. They were bought on February 1, 1936. The order called for 50 cars in all, but only 12 of those cars are included on the Government's list. There was a price adjustment on that. The price was originally fixed at 5¼¢. It was adjusted in the middle of February to 5⅛¢, and all 12 cars were shipped thereafter. That was the result of an agreement between Taxman and Phillips. We found evidence of this agreement in the Phillips files. The Government showed those 12 cars to have been purchased at ⅛¢ over the low of the Oilgram. As a matter of fact, they were purchased ⅛¢ under Platt's low. The original purchase order shows 5¼¢ on February 1, 1936. It would be true that the Government must have relied on the purchase order, and wasn't aware of some other documents that we found in the Phillips file, except that some of those cars, in addition, were purchased on an f. o. b. refinery basis.

3021 I would say about 4% of the cars bought by Phillips were bought above the low. I never made any determination of how many they purchased below the low. I can tell that the Government exhibit shows that they purchased below the low. Government Exhibit 750 shows that Phillips purchased 344 cars below the low of the Oilgram. And Exhibit 751 shows that it purchased 236 below the low of the Journal.

The percentage as to those with respect to Exhibit 750 would be about 14%. With respect to Exhibit 751, it would be something over 20%. That is, for every car bought above the low, there would be about 7 cars bought below the low, as far as the Oilgram is concerned; and about 1 car over to, say, 5 cars under, as far as the Journal is concerned.

I found no purchases by Phillips above the whole market range.

There was something about the freight basis in some of these purchases which would account for the price paid being above the low. In practically every instance where a purchase was made by a major at a price over the low of either publication, it will be accounted for because of a freight saving. That is, it would be bought from such a refinery and from such a location that the major could move it to its destination at a lower net cost to itself,

including freight, than it could from some other re-
3022 finery, or from its own refinery. You will find that
in the few instances in which the majors bought over the low, invariably there is a freight saving or unusual specifications as to the material.

Some of these were bought as a switching charge purchase. I have one right here before me now, in connection with Phillips.

A switching charge purchase would be an instance where the point of origin and the point of destination would be in the same vicinity, perhaps in the same town, so that the car traveling from the refinery to the delivery point to the major would simply be switched over within the same vicinity. A switching charge runs around $6 to $10 a car.

What I mean by saying that these prices above the low were in most cases accounted for by the fact that they were for local shipments, or switching charges, or something of that sort, is that the major company may require gasoline at a certain point, and it may be willing to pay a price over the low in order to buy it at a refinery where the shipment as to distance is minimized, so as to minimize the freight cost. That does not apply only to major companies, but to any buyer of gasoline in tank car lots.

There are two factors in regard to these purchases
which could be said to account for the fact that a
3023 price above the low of the market is occasionally
paid. There would be this freight saving and there would be the unusual specifications of the material. For instance, 62 octane guaranteed would command a premium very often over the low of the published quotations. You may have 60-62, 400 endpoint, which frequently commands a premium of ⅛¢ over ordinary third grade gasoline. The ordinary third grade gasoline has an endpoint ranging from 425 to 435. 400 endpoint material is just a little better, or it may be a little better for a certain purpose; for that reason it frequently commands a higher price.

I can say this in general as to the accuracy of the Government's classification of publication basis purchases, in Exhibit 751, as having been made at, above and below the low: That none of these defendant major companies at any time throughout this period ever bought on a publication basis over the low of the publication, taking all relevant factors into account. There is just one exception to that. That was a purchase made by Globe Company in the spring of 1935 from Cushing, at a time when its refinery at Blackwell was closed down. It involved 5 cars. That is the only exception to that general statement, that the majors never bought over the low of the publication when buying on a publication basis.

Exhibit 751 shows some purchases here to have
3024 been at the low of Journal, plus $6.60 per car. Now,
that $6.60 per car has nothing to do with the price; it isn't part of the purchase price. It is simply the switching charge. In other words, the major buying those cars bought on the basis of f. o. b. refinery, and it paid to the seller $6.60 per car to reimburse him for the switching charge which he prepaid.

Here are some more bought on a publication basis, listed on Exhibit 751 as having been bought at the Journal price for third grade, plus ⅝¢.

We did find purchases made by some of the majors at the low of Journal for third grade, plus ⅝¢, but it was regular grade material. So that it was actually bought under the low of the Journal if you compared it with the proper grade of material.

Right below that you find other purchases made on publication basis at ⅜¢ above the Journal low. I know of such purchases, in fact, I mentioned one this morning that was bought by White Eagle from Champlin on a publication basis, ⅜¢ over the low of the Journal. But the Journal is quoting on a Group 3 basis, and that particular purchase, as I pointed out, was made f. o. b. Hutchinson, Kansas. So that, taking into account the freight differentials and the grades, I know of only one instance in which a major bought over the low of the pub-
lication when buying on a publication basis; and
3025 that, as I pointed out, involved 5 cars, at a time
when Globe's Oklahoma refinery was closed down.

By Mr. Horween

(Stipulation submitted by Mr. Horween is marked EXHIBIT 998 for identification and received in evidence.)

(Tabulations referred to in said stipulation are marked EXHIBITS 999, 1000, 1002 and 1003, respectively, for identification and received in evidence.)

We have verified from the books and records of the Globe Companies the tabulation which you show me, purporting to show the flat price purchases from independent refiners in the Mid-Continent and East Texas fields for the years 1935 and 1936, by each of the Globe Companies separately. We find them correct.

(Tabulation referred to received in evidence as EXHIBIT 1004.)

The 5th column of the tabulation shows the relationship of the purchase price to the Chicago Journal of Commerce. The 6th column shows the number of cars in each purchase transaction, and the total. The asterisks opposite certain purchases in the 1st column indicate that they were for local delivery. A large number of these purchases were made for local delivery, the point of origin and point of destination being the same on each. That is, if it was purchased from an independent refinery located at Blackwell, delivery was made in Blackwell, Oklahoma.

3026 This first tabulation is for The Globe Oil Refining Company of Oklahoma. The refinery of that company is located at Blackwell, Oklahoma. Cushing has two refineries, and one is at Blackwell.

The writing at the bottom of this tabulation, entitled "summary", shows the total number of cars purchased by The Globe Company of Oklahoma, omitting those purchased from Cushing for local delivery. That total is 261 cars. Out of the 261, there are 5 above the low of the Chicago Journal of Commerce, 50 at the low, and 206 below the low.

The Globe Oil & Refining Company of Oklahoma made its first purchase at a flat price from independent refiners in 1935 on February 2. The last purchase in the East Texas field was August 15, 1935, and the last one in the Mid-Continent field was May 29, 1935. Globe of Oklahoma made no more purchases from independent refiners at a flat price in 1935. It made no purchases of any kind from any independent refiners in 1936.

There was practically no manufacture whatever in the latter part of 1934 and the early part of 1935 by Globe of Oklahoma. At that point this refinery was closed down. Then the manufacture picks up here again in the spring of 1935, runs on, and there is a shut-down again in the early part of 1936. You have another shut-down in the latter part of 1936.

3027 This 2nd column represents the volume of the company's purchases of refined gasoline, and the 3rd column represents purchases of natural gasoline which was used for blending in its refinery operation. For instance, when the refinery is shut down for this period, you find no purchases there of natural gasoline to speak of.

There are no purchases here of refined gasoline in 1934. There are some over here in 1933. Then there are no outside purchases by this refinery until you come over here to the early part of 1935.

Sales figures, column 4, are almost zero about the middle of February, 1935, and then start climbing. They practically parallel the rise in the volume of buying. This would indicate that practically all sales made at that time consisted of gasoline purchased from the outside, not of this company's own manufacture.

In the middle of April sales continue to go up, and purchases from outside decline. Beginning in the middle of April, manufacturing operations were resumed; in other words, the refinery apparently has begun to produce again.

The result was that the sales from that time on consisted of the company's own production in addition to outside buying. And as the buying declines the manufacturing increases and that accounts for this total sales volume.

I might point out that there were no purchases here of gasoline on the outside after September. We have none all through 1936.

3028 The sales or shipment figures of Globe of Illinois, ignoring these minor fluctuations by months, show a more or less steady increase from 1933, running across right up to the end of 1937, in which there is a rather sharp increase.

This company purchased much larger quantities of gasoline in various years than the other two Globe Companies. The gap between the company's own manufacture and the company's shipment of gasoline, is made up by purchases of refined gasoline, and also of natural gasoline that was used for blending purposes in the refinery operation.

According to the stipulation in the record the Code authorities determined that for The Globe Oil and Refining Company of Illinois, the minimum working stocks were 45,500 barrels.

I know what the expression "minimum working stocks" means. Working stocks would be the minimum inventory that it is necessary for a refinery to have in order to carry on its normal operation.

The volume of purchases of refined gasoline starts in

February 1935. The greatest volume is reached in June, and then tapers off.

The inventory figures show a peak in 1935, in the middle of January; and at that time it was about 100,000 barrels. Then it starts to go down rather rapidly as the
consuming season comes along, and as it goes down,
3029 sales are going up. At that time they start buying
finished gasoline or refined gasoline. So that for a period of about 4 or 5 months the inventory figure was below 40,000 barrels; in other words, below the minimum working stocks as determined by the Code authority.

I have prepared a tabulation showing the production, shipments and purchases in summary form of this company. During the first 8 months of 1937, this company purchased more refined gasoline, from all sources, than it did in any whole year period preceding, back as far as 1933. In 1933, the first year shown in this chart, it made its next largest purchases. In the year 1936 it made its next largest purchases. In the year 1935 it made the next largest purchases. In the year 1934 it made its smallest purchases.

(Chart submitted by Mr. Horween is marked EXHIBIT 1008 for identification and received in evidence.)

This chart, Exhibit 1008, consolidates all 3 companies, covering everything in connection with the Oklahoma company, the Kansas company and the Illinois company.

The column marked shipments represents the consolidated volume of sales of all 3 companies for 1933.

The next column represents the amount of gasoline produced by all 3 of these refineries in their own plants, with a section superimposed on top of that column, representing casinghead gasoline, or natural gasoline that was purchased and used for blending purposes. That was put into the refinery and mixed with the company's
own gasoline which it produced.
3030 The black area, column 3, represents gasoline
purchased on the outside, the figure below representing the percentage of the volume of refined gasoline purchases to total shipments.

The 3 companies combined purchased the largest percentage of refined gasoline in proportion to their sales in 1933. Roughly, 3% of their total sales represented purchased gasoline. The next largest percentage was purchased in 1935, that is 2.57% roughly 2½%. 1935 is the year when the Globe Oil & Refining Company's plant at Blackwell, Oklahoma, was shut down for the 5 months period. The shut-down started the latter part of 1934, and ran over to some time in April, 1935. The next largest year, so far as percentage of outside purchases is concerned, was 1937. For the first 8 months of 1937, it is 2.37%. The next largest was 1936, a little over 1%. The next largest was 1934, about 1/10 of 1%.

If the inventory had remained absolutely constant, the 2nd column plus the section superimposed on it, plus the black column would exactly equal the shipment column. But that is not the case, because there are some changes in inventory as of the end of each year.

On Exhibit 1000, which is a tabulation showing combined purchases from all sources, purchases are indicated from Globe Oil of Kansas and Globe Oil of Oklahoma. Now, strictly speaking, those should be omitted from the totals because they are with affiliated companies.

In 1935 purchases were made from Sun Oil Company. It might be rated a major company.

3031 In 1936, a purchase of 111 cars was made from Wiloil Corporation, a broker in Pittsburgh, Pennsylvania. There is another purchase from the same Wiloil Corporation during the first 8 months of 1937, 110 cars.

Cross-Examination by Mr. Chaffetz.

From Exhibit 1002 it appears that in 1933, roughly 8% of the purchases made by the Globe companies were made from independent refiners whose names appear in the indictment; in 1934, none; in 1935, about 56%; in 1936, approximately 42% and in 1937 down to August 31st, I would say the Globe companies purchased about 35% of all the gasoline that they purchased from the same group of independent refiners who are named in the indictment.

In connection with the 1935 figures, by reference to Exhibit 1000 it appears that Marimac Oil Company is one of the "other refiners and brokers." They sold the output of Wabash; so there may be, and in all probability is, a lot of gasoline there coming out of Wabash, one of the independents named in the indictment. So in 1935 the percentage might be even greater than the 56% named.

Redirect Examination by Mr. Horween.

It is true that the total purchases in the year 1934 from all sources were very small, roughly 232,000 gallons.

Compared with 1935, 1936 and 1937, the purchases
3032 in 1934 are negligible. They jumped to 5,100,000 in
1935, to 2,500,000 in 1936; and 4,300,000 during the first 8 months of 1937.

None of the Globe companies made any flat price purchases whatsoever during the year 1936.

There was just 1 flat price purchase made in 1935 from independent refiners by Globe of Kansas, and that consisted of 6 cars. There were 5 flat price purchases by Globe of Illinois during the year 1935, aggregating 31 cars.

Direct Examination by Mr. Francis.

(Certain documents are marked Exhibits 1009-A and 1009-B for identification.)

Exhibit 1009-A shows a comparison of The Pure Oil Company's flat price gasoline purchases from Eason Oil Company with Eason's total sales for the years 1935 and 1936, and "B" is a comparison of Pure Oil Company's flat price and market date of shipment purchases from Eason Oil Company and Eason's sales for the years 1935 and 1936. I have compiled these two exhibits from the figures that are in evidence here.

(Documents referred to received in evidence as EXHIBITS 1009-A and 1009-B.)

Exhibits 1010-A and B are like comparisons with Omar Refining Company.

(Documents referred to received in evidence as EXHIBITS 1010-A and 1010-B.)

By Mr. Donovan.

Various refinery markets as distinguished from the
3033 Group 3 market had their own price range. I could
not fairly compare prices for purchases made in those local refinery markets with those Group 3 prices.

I know about the testimony here in regard to purchases by the defendant companies in East Texas.

I have made a study of the records of purchases by these defendants from independent refiners in East Texas. In that study I found that a large number of purchases had been made on an f. o. b. Group 3 refinery basis from East Texas Refineries. I found that there had been some purchases on an f. o. b. East Texas refinery basis. I have made a comparison between the prices paid on f. o. b. East Texas refinery purchases and the quotations carried by Platt's

Oilgram in the East Texas refinery market for the year 1935. I have prepared a chart which would illustrate what has just been said.

(Chart referred to marked Exhibit 1011 for identification.)

This chart makes a comparison of the prices that were paid by all the defendant majors on flat price purchases on an f. o. b. refinery basis out of the East Texas field, with the quotations that appeared in Platt's Oilgram for that particular refinery market. This chart covers the entire year 1935 and is based on the Oilgram.

It is based on an audit of material that I have here, the records of the major companies as to their purchases from these various independent refiners and brokers. That 3034 chart accurately discloses the date and price of every f. o. b. East Texas purchase during the year 1935, by these defendants who now are on trial. The dots are placed on the chart on the day of purchase.

This is January 1935, on the left here (indicating); runs across to the end of December, 1935, so it covers the entire calendar year 1935.

The horizontal lines represent a price line. For instance, this heavy line here (indicating), represents 4¢. We have a red line up here (indicating); that represents 5¢. Between 4¢ and 5¢ there are seven other lines, so that each space between the horizontal lines represents ⅛¢ in price.

The chart contains the price range as reflected in Platt's Oilgram for the East Texas refinery market at the beginning of the year for both third grade gasoline and regular grade gasoline, but in May, 1935 the Oilgram discontinued publishing any quotations on regular grade. As a matter of fact there are no sales plotted on this chart for regular grade during these periods. These are all third grade purchases.

At times you will see that there was a range in the published quotations of the Oilgram. For instance, in all the month of June, 1935, the Oilgram reflected a range of from 4⅝¢ to 4¾¢. That was supposed to be the going market at which independent refiners, brokers, and major 3035 companies were selling gasoline to jobbers on the spot market. At other times throughout the year you will find no ranges quoted. There is simply a line. (Indicating.) In other words, that was the going market. Then in the middle of May, 1935, you simply find a line. The lines shown here are horizontal lines, 4⅝¢. That means 4⅝¢ was the going market. The Oilgram found no range to quote in that particular period. You find the same thing true over here in September, 1935. Again, in December, 1935, there is no range. Throughout most of the rest of the year, you find a range of ⅛¢. The last, the Oklahoma chart, or Group 3, sometimes shows a range of ¼¢, but this particular chart for the f. o. b. East Texas refinery market never shows a range beyond ⅛¢.

Each dot on the chart represents a purchase transaction, that is, a purchase by a defendant major company from a refiner in the East Texas field, or a broker that was supplying material out of the East Texas field.

Under these dots, there is frequently a number. If there was more than one purchase transaction on a given date at the same price, in order to show up the total volume of purchase transactions, we had to put a number under that to indicate how many transactions there were. There is one here; for instance, in April it shows 7 purchases at the same price on the same date. Wherever there is no number appearing under a dot, that indicates only one purchase transaction on that date at that price. The dates that are on this chart are the dates of the purchases. 3036

This represents all the flat price f. o. b. East Texas refinery purchases by the defendants in 1935.

The prices paid by the defendant companies were not all the same, as shown by that chart. For instance, here is April 8. There were 9 purchase transactions on that date at 4 different prices. I have other examples. On April 12, there were 5 purchase transactions at 3 different prices.

Cross-Examination by Mr. Chaffetz.

I used the prices actually paid. So that if there were some prices not as of the purchase order, it was because the material was not good or something of that sort. I took into consideration only the price that was finally agreed on. We took the price actually paid after the invoice was rendered. If there was a later adjustment of a credit memorandum because of an outage or defective material, we didn't put that up.

Q. You took the invoice date?

A. Then we would take the invoice price, and I don't know of any such offhand. I don't recall of any such.

3037 *Direct Examination (Cont'd.) by Mr. Donovan.*

In the entire year there is only one day that we find any purchase over the low, but there happened to be 3 purchases at that same price, all made by the same defendant major, and an aggregate of 5 cars.

As I see that chart, the prices paid by the defendant companies were lagging. That is very noticeable in March, April and May. This line here indicates the range for the quotations as they appeared in Platt's Oilgram. Whereas, the purchase transactions generally run about ⅛¢ below that market.

In June, of course, the published price was constant through the month. The Oilgram showed a low of 4⅝¢ and a high of 4¾¢. Now, the highest price that the majors paid in June was 4⅝¢, which is the low of the Oilgram, but they also made purchases at 4½¢ in June and some at 4⅜¢, and 1 as well at 4⅛¢, and 1 as low as 4¢.

If that 1 at 4¢ or 4⅛¢ was off-specification material, or something of that sort, I don't know of it.

Cross-Examination by Mr. Chaffetz.

The greater bulk of all of the purchases in June were at the low. In June there were more purchases at the low of the published quotations than there were under the low. I think 8 of them were under the low.

3038 *By Mr. Donovan*

In July there are 19 purchase transactions under the low, and in August, there are 31.

(Chart previously so marked for identification is received in evidence as EXHIBIT 1011.)

Direct Examination (Cont'd) by Mr. Donovan.

Exhibits 747 through 751 purport to show certain purchases by defendant companies from independent refiners. They cover the period from March 1, 1935 to April 30, 1936. They do not report Sinclair's purchases. They explicitly state that Sinclair is excluded. I have made an audit of this amount of these defendants' purchases from independent refiners.

I am familiar with the charge in paragraph 23 of the indictment that certain of the independent refiners in the Mid-Continent field curtailed their production of gasoline.

I have made a study of the exhibits and testimony in this case relative to the amount of gasoline produced in each of the years 1934, 1935, and 1936 by the Mid-Continent independent refiners specifically named in the indictment and also produced during those years by other independent refiners operating in the Mid-Continent field not all such other independent refiners operating in the field, but a large number of them.

I made that study with a view of determining whether or not the production of gasoline by those refiners in-
3039 creased or decreased during those 3 years. I have prepared a summary showing the total amount of gasoline produced during each of the years, 1934 to 1936, inclusive, by the independent Mid-Continent refiners specifically named in the indictment. I would have to exclude Taxman Company, because we didn't have complete figures for the entire 3 year period, 1934 to 1936, and we were unable to get those figures, because Taxman Refining Company went out of business.

Excluding that company, for 1934 the total production would be 295,154,204 gallons; for 1935, 356,862,132 gallons; for 1936, 397,780,076 gallons. In 1935, the production increased as compared with 1934 by almost 21% and in 1936, the increase over 1935 was about 11½%. The increase in 1936 over 1934 would be well over 30%.

I have made a study also of a number of the Mid-Continent independent refiners, in addition to those that I have just talked about as being specifically named in the indictment, with a view of determining more exactly whether the Mid-Continent independent refiners as a whole increased or decreased their production during those 3 years. I made a study of 10 additional refineries operating in the Mid-Continent field, independents, of course. They were Anderson-Prichard Refining Company, Black Gold Refining Company, Coltex Refining Company, Cosden Petroleum Corporation, Derby Oil Company, El Dorado Refining Company, Kanotex Refining Company, Lion Oil & Refining Company, Rodessa Oil & Refining Company, Root Petroleum Corporation, Sun-Ray Oil Company and Vickers Petroleum Company.

3040 I have included their production in my study along with the production of those specifically named in the indictment. The total production of those two groups of Mid-Continent independent refiners, together, in 1934 was 659,933,992 gallons; in 1935, it was 774,350,817 gallons; in 1936, it was 868,156,624 gallons. In 1935, the production increased, as compared with the preceding year, 1934, by about 17% over 1935.

It is a fact that not only did the Mid-Continent independent refiners as a whole increase their production in each of the years I have named, but that those Mid-Continent refiners specifically named in the indictment showed an even greater ratio of increase than this entire group of Mid-Continent refiners.

I am familiar with Exhibit 947, showing Gasoline Consumption, 1930 to 1936, Total Mid-Western Area Against Total United States. That Exhibit shows an increase in the consumption of gasoline in the Mid-Western area during the 1935 over 1934 of 6.99%, that is, in round figures, 7%. 1936 shows an increase over 1935 of 10.58%, that is, roughly, 10½%.

The consumption increase for the Mid-Western area is less than the increase in production for the independent Mid-Continent refiners, taking them as a whole; and it is still less, confining it to the independent Mid-Continent refiners named in the indictment.

3041 From my study of this testimony and these charts and exhibits, I conclude that the Mid-Continent independent refiners, instead of curtailing their production of gasoline, increased it very substantially. And it would be true to say that the percentage by which they increased it was even greater than the percentage by which the consumption of gasoline in the Mid-Western area increased during the same time. It might be 3 times as much. That was in 1935 and in 1936.

3042 (Document submitted by Mr. Donovan marked EXHIBIT 1012 and received in evidence.)

By Mr. Chaffetz

Q. From all the figures you read yesterday you cannot tell the jury whether or not any of those independent refiners would have produced more gasoline if they were not participating in a buying or selling program; isn't that right?

A. Some of them may have been running at capacity. I don't know that, Mr. Chaffetz.

Q. All you know is what they actually produced?

A. That is right.

Q. It is entirely consistent with everything you have told us that those companies were in a plan, were cooperating together in some way, and that it was part of such a plan that they would limit their production to some extent; is that right?

A. I would not say that, no. I think it is quite inconsistent with that theory because in 1936 this group of Mid-Continent refiners named in the indictment increased their production over 1934 by, I think, 35% and that is a very large increase.

3043 Q. Yes, and consumption increased too during that year, didn't it?

A. Yes, but consumption increased less than 7%. Let's see—less than 7% in 1935; it was more than that in 1936, but I do not think it was more than ½ of the increase in the production of these particular Mid-Continent refiners named in the indictment.

Q. But unless you know whether or not they could have produced more you cannot tell whether they were parties to any agreement or understanding not to produce more?

A. I think it is safe to say, Mr. Chaffetz, that the theoretical capacity of those refineries was greater than the actual production in those years.

By Mr. Donovan

I have some corrections I would like to make in my own testimony. When I was on the stand some days ago I testified as to the lack of uniformity in the prices paid by the defendant majors on flat price purchases either f. o. b. Group 3 or f. o. b. Oklahoma, and at that time I submitted 4 statements which were marked Exhibits 874, 875, 876 and 877. Each one of those represented or showed the prices paid on different dates in each of the 4 months, March, April, May and June, 1935. That is, Exhibit 874 showed the 3044 prices paid by the majors on various dates in March.

Now, in connection with Exhibit 875, which covers April, there is a mistake in the record. This mistake is not in the Exhibit; it is merely in the record. It appears on page 1559. It has to do with April 22nd. I testified that on that day Globe bought at 4⅜¢. That should have been Mid-Continent. The Exhibit shows that on April 22 there were 7 purchases made at 2 different prices. That is wrong. It should be 6. I inadvertently included 2 purchased by Shell at 4⅜¢ on that date. There was only 1 purchased by Shell on that date. That covered 5 cars from Eason Oil Company, but the order was split as to the f. o. b. point. 4 cars were bought on a Group 3 basis, and 1 car on an f. o. b. refinery basis. Due to the split in the order we inadvertently included this as 2 distinct orders when it really was only 1.

On Exhibit 876, which pertains to May, 1935, there is an error. I testified that on May 29th there was a purchase made by Phillips at 4¾¢. There is an error in that date.

The purchase made by Phillips at that price was on the following day, that is, on May 30th. As a result of that error on the Exhibit the testimony is in error also.

On Exhibit 877, that is, for June, I testified that on June
7th there were 5 purchases at 3 different prices, and that
Globe made 2 of those at 4⅝¢. There again is a split order,
but it was just 1 order. Globe bought from Atlas
3045 Petroleum Company 10 cars on an f. o. b. Group 3
basis, but 3 of the cars were shipped out of North
Texas and 7 out of Oklahoma. Due to the 2 different shipping points we had split that order, and in making our tabulation we inadvertently took that up as 2 different orders, but it was just 1 order. That is all on that.

I have made an examination of service station prices for gasoline in the Mid-Western area, and a comparison between those prices and the prices in the rest of the United States. That was made from the Platt Oil Price Handbook. That is the same Handbook that the Government chart of retail prices was based on.

There is a Platt's Handbook for each calendar year. It shows the service station prices in all the cities, or in a large number of representative cities throughout the United States, for every Monday throughout the year. We took those prices for every Monday. We eliminated from those service station prices the amount of taxes that are included in them. The Handbook tells us how much federal tax and how much state tax is added to that service station price. So we took off the taxes, and we took all those cities shown in there, and added them up and got an average.

We followed that Handbook list of cities exclusively,
with just one exception. The Handbook shows only one
state-wide price for Ohio; it doesn't show any cities for
Ohio. For instance, there is no price shown for such
3046 large cities as Cleveland, Toledo, Cincinnati, Akron,
Youngstown and Columbus. Now, these cities are a
great deal larger than other cities shown in the Handbook, such as Decatur, Illinois, or Quincy, Illinois, or Fargo, North Dakota; so, with that one exception, we threw in those 6 large cities in Ohio, at the state-wide Ohio price.

We didn't have the same number of cities all the way through because the Handbook itself changes over a period of years. You may find a different number of cities reported in one year in the Handbook from another year.

We compared this average of service station prices with the average of service station prices in the Indiana territory.

But one factor accounting for the change in the number of cities was this so-called Iowa Plan, which went into effect on July 1, 1935. As a result of that there was a change in the number of cities which show the service station price.

I might say, too, that the number of cities changes so much after the fall of 1936 that it isn't practicable to go beyond that in any city.

I would say they are representative cities of the whole country. I have taken those from the Handbooks I have just described, which are in evidence as Exhibits for the years 1934, 1935 and 1936.

I have had a chart prepared showing the comparison.

3047 (Chart referred to is marked Exhibit 1013 for identification.)

First of all, the chart covers the entire calendar year of 1934, the entire calendar year 1935, and it runs in 1936 to the end of July.

This, over here (indicating), is 1934. That takes into account this big dip in the fall of 1934 (indicating). That is the end of 1934 there (indicating), just as there is a recovery from that very pronounced dip. Now, the end of 1935 would be right there (indicating). That is distinguished by this rather pronounced rise here, when the advance in crude took place.

Early in January, 1936 crude advanced 10¢ and 15¢ a barrel, and the retail prices of gasoline advanced about ½¢ a gallon.

The figures on the left hand side of the chart represent cents per gallon. At the very bottom, we start with 10¢ and we get up here to 15¢ (indicating).

Each one of these spaces here (indicating), which is 10 inches in extent, represents a difference of 1¢ a gallon in price. This is drawn to such a scale that 1 inch on this represents 1/10¢. Most of the changes in retail prices are measured by 1/10¢.

The heading of this chart is "Service Station Prices ex Taxes." Now, that means that we have eliminated all Federal and state taxes, to put this on a comparable 3048 basis. The tax differs in different states. It may be 2¢, 3¢, 4¢, or it may be up to 6¢. To get the proper average, we had to eliminate taxes to arrive at the retail service station prices, less all taxes, including sales taxes.

I might state that each one of these spaces here (indicating), between the vertical lines, represents a week; but we didn't work this out on a daily basis. It is worked out on a Monday basis, each Monday of the year, to conform with the Handbook, because the Handbook only gives prices on Mondays.

Now, at the very bottom here (indicating), there are some notations which show the number of cities that were averaged. For about the first half of 1934, taking it on the nation-wide basis, we averaged 116 cities. For the last half of 1934,—I am speaking roughly; it isn't exactly the last half—we averaged 123 cities. For all of 1935 we averaged 132 cities. And for the first two months of 1936 we averaged 137 cities. For the next portion of 1936 (indicating), it is a little more than a month, we averaged 136 cities. Then, for another short space of time (indicating), 137 cities.

Now, by that time we were running into the end of May, and there were so many changes throughout the country, due to the spread of this so-called Iowa Plan, that we had to make a lot of changes in the number of cities that we were averaging. By the time we got to the end of
3049 July (indicating), we were getting into a lot of difficulty. There were so many changes at that time, that we broke off at the end of July.

The prices in the Mid-Western area are all in the Handbook also. They are included in the nation-wide study, but they are in the so-called Standard of Indiana territory.

Those prices are shown on the chart by this green line (indicating), which starts at the beginning of 1934, at a little over 13½¢. The green line is always the bottom of the red area and it is always the top of the brown area.

There were 35 cities through most of 1934, that we averaged in the Mid-Western area. Then, through 1935 and December, 1934, there were 28 cities. Then, for the first 7 months of 1936 we averaged 24 cities. The drop from 28 cities to 24 cities is accounted for, again, by the Iowa Plan. There are 4 cities in Iowa which we had to drop out in the 7 months of 1936, because the Platt's Handbook doesn't show any prices for those 4 cities in Iowa, beginning January 1, 1936. There are 4 cities in the Handbook within Iowa.

Now, to trace the green line across the chart: That represents the average service station prices of these various cities in the Mid-Western area, ex taxes, as I have said before. It starts over here (indicating), January 1, 1934, at something over 13½¢. It runs across on a level
3050 line for about 7 weeks (indicating), all of January and a part of February. And then it jumps up, in February, 1934, to a point that is around, I would say roughly.

14 7/10¢. I might be wrong by 1/10¢, but it would appear from this chart that it is about 14 7/10¢. Then it remains level for 3 weeks at that point. Then it begins to go off (indicating).

It comes down, and within 5 weeks it has dropped down to 14¢. Then it continues to drop on down, and reaches a point of about 13½¢ by the end of April; so that, at that point (indicating), it is lower than it was at the beginning of the year.

And it drops even lower here, early in May (indicating), and then it varies from week to week, there are changes, and it runs over here to September (indicating).

Now, in September, 1934 it takes a precipitant drop. There is a vertical drop of 1¢ a gallon. Then it remains more or less at that level for about 3 weeks, and then it drops almost another 1¢ (indicating). Now, at that point, we are in October, 1934.

Then it drops in various stages, in a relatively short time, about another 1¢; and the bottom point of that very pronounced movement (indicating), I would say, is around 10 7/10¢ a gallon. And it reaches that point about the middle of November, 1934.

3051 Then it remains fairly close to that level for a period of about 3 weeks, and then it starts a rather irregular climb (indicating), and then it recovers a great part of that drop; and at the end of 1934 it is about 11 8/10¢. So by the end of 1934 in a period of about 6 weeks, it has recovered about 1¢ a gallon.

It continues that recovery in January, 1935. The maximum recovery in January, 1935, I would say, is 9/10¢.

And then it drops off again (indicating), about 3/10¢, and holds that level fairly constantly until March; then there is further recovery.

There is recovery in April and May, and it gets up to about 13 6/10¢ by May, 1935; and it holds that level on into June. In June, it reaches a maximum point of 13 8/10¢. I am talking straight through here now on the Standard of Indiana territory, on Red Crown, regular grade. And, while I am talking about Red Crown, it is the prices posted by the market leader, Standard of Indiana. I am not talking now, though, about the normal price of Standard. This is the actual service station price of Standard.

Then, in July and in June, too, it starts in June, it begins to go off. Then it has a rather irregular line, running across to the end of 1935.

And then in January, 1936, due to the advance in the price of crude, we have this advance here (indicating), of about ½¢ in the service station price, and it gets up to about 13 9/10¢ in January, 1936.

3052 There is further recovery over here (indicating), and it gets over to a rather irregular but fairly general level in 1936 of about 14 2/10¢; and that is the level at July, 1936, at the end of our study.

The other line, that is, the black line shows the rest of the United States.

That starts on January 1, 1934, at 14½¢, which is about ½¢ a gallon higher than in the Mid-Western area. That falls rather rapidly, and at one point there, around the end of January (indicating), it dips just a trifle under the Mid-Western level. But it recovers within a week, and rises again over the Mid-Western level.

But in February, 1934, it continues a decline which started in January, or about the end of January; and it declines as the Mid-Western price goes up (indicating). So that, for a period starting in February and continuing into May, 1934, the average Mid-Western service station price level is higher than the rest of the United States. If the prices had remained where they were at that time, the prices in the Standard of Indiana territory would have been higher.

Now, then, the price level in the rest of the United States starts to recover from its low point about the end of March. It starts an irregular recovery that continues into June. That recovery from the low point is about 1¢ a gallon, and it gets up to this level here, (indicating), which is about 14 2/10¢.

Then there is an irregular line, which holds stead-
3053 ily for about 2 months, and then it begins to slide off,
(indicating); but it is going off along with the level of the Mid-Western area, but continuing at a level higher than the Mid-Western level; that is, the lines are more or less similar, but the Mid-Western level is lower than the rest of the United States.

The prices in the Mid-Western area were lower, and the extent to which they were lower is indicated by that red area. And as long as you see the red area here, running across the latter part of 1934, and it continues all through that part of 1934, including the period of the recovery, that indicates the price level in the rest of the United States was higher than it was in the Mid-Western area, and it also indicates the extent to which it was higher. For instance, in the very bottom of that drop, which was in November, 1934, the Mid-Western level is, I would say, about ⅜¢ lower than it was in the rest of the United States. The average for the rest of the United States never went down that low. That means that the prices here were considerably more depressed than in the rest of the United States. The rest of the United States never got down below a point of about 11½¢. And, as I said before, in the Mid-Western area it got down to 10 7/10¢.

During the period of the recovery, from that pronounced drop in the latter part of 1934, the line indicating the aver-
age for the rest of the United States continues to
3054 lead the Mid-Western area, and that is indicated by
this red space here.

I wouldn't say that the recovery was more pronounced in the rest of the United States than in the Mid-Western area, because it never dropped as low as the Mid-Western area, so that as a consequence the recovery would not be quite as pronounced. I would say that the recovery in the Mid-Western area was more pronounced from a sub-normal level. I would say from a very low point.

In the other parts of the United States the recovery was ahead of the Mid-Western area, in point of time. It started a few weeks earlier. There was a lag in the Mid-Western area, in period of time, so that we always have through that period of recovery, a higher price level in the rest of the United States than we have in the Mid-Western area. That continues on here into the spring of 1935; and at all times through that period, even when it reaches the high point here, or what is close to the high point, in May, 1935, the rest of the United States is about 3/10¢ higher than in the Mid-Western area.

During the last 2 weeks of June and the first week of July the price level in the rest of the United States drops perhaps 1/10¢ under the level of the Mid-Western area. That continues, although at an irregular line, rather uniformly at 1/10¢.

Then they get together and they coincide for just
3055 1 week. That is the second week in July, 1935.

And then we come to a red area again, which indicates that the price level in the rest of the United States is higher than in the Mid-Western area. That is this red area here (indicating) in the latter part of July and August, running into September.

We find there is just 1 week there, just 1 point, when they come together again. That is in September, 1935. But they immediately diverge, and that is indicated by this red area over here (indicating) which runs through the remainder of 1935 and into 1936, when the rise in price occurs. And that spread through that period ranges from we will say 2/10¢ to ½¢. This would be about ½¢. The outside territory was higher, ranging from 2/10¢ to ½¢ over the Mid-Western areas.

When the price rise occurs, in January, 1936, we still have a higher level in the rest of the United States than we have in the Mid-Western area. That is indicated by this red area over here (indicating). And that is about 3/10¢, upon the average, running through the remainder of January and February, into March.

Then in March we find that the price level for the rest of the United States again drops below the level of the Mid-Western area, for a period of 5 weeks. The extent to which it drops below is very, very small; that is, at the very
most, it might be a little over 1/10¢ and it probably
3056 does not average in that 5 weeks period as much as
1/10¢. It is merely nominal.

Then in April the level of the rest of the United States again rises over the Mid-Western area, and is indicated in this red space here (indicating). It continues, we find, for about 5 weeks, when again, for 2 weeks, the price level in the rest of the United States again drops below the Mid-Western area about 1/10¢. That 2 weeks period is in the latter part of May.

Then there is again a rise in the rest of the United States, which carries the price level over the Mid-Western price level at various amounts ranging from 1/10¢ to 2/10¢, during the rest of the period until the end of July, 1936, where we break off.

In the year 1934 there were 14 Mondays in which the price level in the Mid-Western area was higher than in the rest of the United States, and for all other Mondays in the year it was lower. That is for 1934.

For 1935 there were only 3 Mondays in which the price level in the Mid-Western area was higher than the rest of the United States; and there is 1 Monday when they are on a par, when they happen to coincide. With the exception of those 4, the price level in the Mid-Western area is lower than it is in the rest of the United States.

For 1936 there are 7 Mondays in which the price level in the Mid-Western area is higher than the rest of the
United States; and in the remainder on down
3057 to July 31, 1936, the price level in the rest of the
United States is higher. In 1936 for those 7 weeks,

that difference might average about 1/10¢. In some weeks it is nominal, as is indicated here, and in the week in which the difference was the most pronounced it was about 1½¢. I would say for the 7 weeks it would not average more than 1/10¢.

(Chart, previously so marked for identification, is received in evidence as EXHIBIT 1013.)

Cross-Examination by Mr. Chaffetz.

Q. Don't you know that in this area, located as it is, closer to the source of supply of raw material, under conditions of free and fair competition, you would expect lower prices here for gasoline than you would in the country as a whole?

A. No, I don't think that the proximity to the source of supply, in point of distance, is the sole factor. Transportation cost may be of more importance. In fact, I think it is the most important factor. You may transport crude oil, perhaps by pipe line or by boat, a great distance, much more cheaply than you can, for instance, by tank car. In fact, I know of very few instances in which crude oil is transported by tank car. That is a rather unusual movement. In other words railroad freight is much higher than if moved by boat or by pipe line. 3058

Q. You have to take into consideration pipe lines and tank car movement and tankers?

A. I think you have to take into account many factors.

Q. Considering all of those factors, isn't it true that over a long period of years the price of gasoline in the Standard of Indiana territory was normally lower than the price in the country as a whole?

A. That I couldn't answer. You are getting out of my sphere there also, I might say.

Redirect Examination by Mr. Donovan.

It is true that from this chart it appears that over a period in 1934 the price in the Mid-Western area was higher than the rest of the United States. I think we find a greater variation, a greater spread in the lines in the price level at the time when the price level in the Mid-Western area was

higher than it was in the rest of the United States. That is here (indicating), in March and April, 1934, we have a spread there that is as much as 1¢ a gallon or perhaps more. Now, there are very few times here where you have a red area where the spread is as much as 1/10¢, ex-
3059 cept these few weeks here (indicating), where there happened to be a lag in a pronounced movement. It is a lag in time, I mean.

Direct Examination by Mr. Donovan (Continued).

At your request I have had prepared under my supervision a tabulation showing the variation of average actual service station prices from average normal service station prices in the Mid-Western area.

We started that tabulation July 20, 1934, and carried it over to September 10, 1936.

In determining the actual normal averages in service station prices in the Mid-Western area we used the 28 cities which are shown in the Oil Price Handbook. Those are the same cities that the Government used in its Exhibits 673 and 674. The 4 Iowa cities were excluded there after July 1, 1935, when the so-called Iowa Plan went into effect, and I think that at that time Standard of Indiana ceased posting service station prices in those 4 cities. So that after July 1, 1935, our average is based on 24 Mid-Western cities, instead of 28. We made the tabulation only up to September 10, 1936, because by that time the so-called Iowa Plan had spread to such an extent that it was extremely difficult to make any study beyond that point. That is, Standard of Indiana had discontinued posting service station prices practically throughout its territory.

The prices in the Oil Price Handbook represent actual prices. The average of the actual prices which we have prepared is an average of the daily prices. The
3060 Handbook publishes prices for Monday of each week, but it contains some narrative after the tables which sets forth all the general changes and the local changes that took place throughout the territory, and it gives the date on which those changes took place; so that from that narrative it is possible to use the tables as a basis to work out actual prices every day throughout the entire period. You can tell exactly the prices posted every day.

We added the actual service station prices for all these cities for each day, and divided by the number of cities we were taking into account; and in that way developed an average.

The Handbook did not publish the normal price. You can arrive at that through the actual price, and taking into account the general changes noted in the Handbook, and from that you can develop the normal price. The local changes wouldn't be reflected in the normal price.

As a rule you couldn't determine the normal price for each city when you start out merely with the price shown in the Handbook as of July, 1934. You would have to work from the actual price, taking into account general changes, and as you ran down through the general changes you would find reference in the Handbook to a general change on a certain date, which amounted to so much and which brought the actual price to correspond with the normal price, or to a certain stated relationship to the normal price so that from that you could
3061 develop your normal price. And so, by taking into account all the general changes that took place after July 20, 1934, you could work back and develop your normal price for each city throughout the entire period. After we did that, we went to the Standard of Indiana's office to check the accuracy of our work, and found that that worked out.

We figured out the normal price for each of these days throughout these cities. After we determined the daily average normal price and the daily average actual price, we determined the difference, that is what was the gap, to what extent was the actual price subnormal or below the normal price.

I have a chart prepared which represents in graphic form those variations I have figured out.

(Document referred to marked Exhibit 1014 for identification.)

As to the period of time, this chart starts July 20, 1934, and runs across into September, 1936. The period here indicated, that is, after this rise here in this area (indicating), is the remainder of 1934. That is, this black line is from July 20, 1934 to the end of 1934. The end of 1934 is indicated by that heavier black vertical line.

This black line here (indicating), would be 1935. The remainder of this is 1936, into September.

Each one of these vertical lines represents a spread of 5 days, except for the last one of each month which takes up the remainder of the month. For instance,
3062 if there are 31 days in the month that last area there between the two vertical lines would be 6 days instead of 5 days.

These figures on the margin on the extreme left and right of the chart represent 1/10¢. It starts at the top with 1/10¢. First we start with a heavy horizontal line which is marked "normal." Then we have spaces here between the horizontal lines each representing 1/10¢. It runs down to the bottom which is 2½¢.

That is drawn to scale. Each one of these spaces between the horizontal lines is an inch, and that represents 1/10¢ difference in price.

Again we are dealing with prices ex-taxes. We had to do that to put the thing on a comparable basis, because these prices in the most of the 28 representative cities in the Mid-Western area, which includes 10 different states, may have a difference in the state gasoline tax. So we had to eliminate taxes to put the thing on an equal basis, because we are dealing here with averages of the 28 cities.

This normal line (indicating) is not price. That does not indicate a price level. The heavy black horizontal line is not a price level. As I stated a little while ago, we determined the average normal price of these 28 cities throughout this entire period. Then we also determined the average actual price of the 28 cities, and having those two prices for each day, the average for each day, the average normal and the average actual for each day, we were able to determine the gap,
3063 that is, the disparity, how much the actual was under normal. So this line here (indicating) is simply a level line so that we have something with which to compare the disparity, the difference between the actual and the normal.

The actual represents what the public pays, and the red area (indicating) indicates the difference, the variation between the actual price and the normal price. The red area shows the fraction of a cent per gallon which the actual price was under the normal price. It does not represent the price paid, in figures. It represents the difference, or the variation, and the variation is always below. That is, the actual price throughout this entire period was below the normal price, with the exception of this short period in April, May and June, 1935. At that time they happened to be in agreement. With the exception of one or two shorter periods there they are in agreement in April, May and June, 1935.

I will take our starting point July 20, 1934. We determined what was the normal average price at that point, and then we determined what was the average actual price at that point, and the spread. The difference between the actual and the normal for those 28 cities on July 20, 1934, was exactly 1¢, and that is indicated here by the extent of the red area. That is below normal.

The actual price was 1¢ below normal. Now, that 3064 runs fairly steadily, with the exception of one brief period there, for the remainder of July and for about twenty some days in August.

I do not mean the price was the same, I mean the difference. There could be a difference and a variation of the normal price, but the spread between the normal price and the actual price remains constant. There is a constant relationship there, and that spread is 1¢ throughout that period. Irrespective of what the normal price is, the actual price is 1¢ below the normal price.

Now, there are some changes for short periods in July and in August, and also in September; but in September there is a pronounced reduction in that gap as is indicated by this white area here (indicating), and a much shorter red area above the red line. That took place in the middle of September. You find there a narrowing of the gap or spread, from 9/10¢ to 2/10¢. That means that the actual price was closer to the normal price by 7/10¢. Or, stating it in a different way, the actual price was below the normal price by just 2/10¢. That held for only about 3 days, and then the gap widened again. It widened to 3/10¢, and that was for about 2 days; and then again to 4/10¢, and that held for about 4 days, and then to 5/10¢; then it closed again for a short time.

But again early in October, 1934, we find the gap widened out tremendously. It starts out early in 1934, and we see a tremendous drop, and we go down into November, and by the middle of November the gap be- 3065 tween that normal price and the actual price is 2½¢. That is, the actual price was 2½¢ below the normal price by the middle of November, 1934.

That spread continues for about 7 or 8 days, and then starts a gradual closing up of that gap. That began to close about November 22, 1934 and throughout the remainder of 1934, and by the end of 1934 the actual price was 1-2/10¢ below the normal, so that whatever the normal price is the actual price is still 1-2/10¢ below.

At the beginning of 1935 it was the same as at the end of 1934, that is, 1-2/10¢; and then early in January, 1935, that gap continues to close up, that is, the spread is narrowed between the actual price and the normal price. By the end of January, the actual price is up fairly close to the normal price, that is, within 1/10¢.

It does not hold constantly at that variation, but it is from 1/10¢ to 2/10¢ from then on until we get to about April 8th.

At that time for the first time since July 20, 1934, the actual price coincides with the normal price. That is the first time that the actual price has reached normality.

Through the remainder of April, 1935, with the exception of about 4 days early in May, the actual price continues to coincide with normal until we get into the middle of June, and again there is a spread of 1/10¢ (indicating). That closes up again, and the actual price gets back to
3066 normal, until June 22, 1935, when there is again a 1/10¢ spread. And then, just for a day in July, the actual price is again in agreement with normal (indicating). But, then, immediately after that, in July, 1935, the actual price drops below normal, and continues from then until the end of the period below normal, at varying amounts ranging from 1/10¢ on down to 7/10¢. 7/10¢ is the extreme spread from then on.

The sub-normality never got to a point as low as it was in July, 1934. The most extreme spread from that time on is 7/10¢, whereas in July, 1934, it was 1¢.

(Chart previously so marked for identification is received in evidence as EXHIBIT 1014.)

Cross-Examination by Mr. Chaffetz.

In my studies, I found that there are some cities that are almost continually subnormal. In some cities the situation is more acute than in others.

I think I could answer, in general terms, whether the subnormal price has come to be regarded as the normal price in certain cities; whether the price normally prevailing in those cities is 1¢ below the theoretical, or some amount below the theoretical normal price in those cities. As I said before, there is a variation as between cities, that is, the competitive situation may be more acute in some cities than in others; there may be more price cutting in some cities than in others, or in some areas around the city. But I think that the normal price in these various
3067 cities takes a general competitive situation into account.

The normal price I talk about is not a theoretical price at all. The normal price is posted. The actual price and the normal price are one and the same, unless there is some unusual local competitive situation. That is the fact. I gave you the price.

When I talk about a normal price, I am not talking about a posted price posted by Standard of Indiana as its idea of what the price ought to be. The normal price is the price Standard of Indiana will post at its bulk stations, to be the price at which the gasoline shall be sold, barring an unusual competitive local situation.

It also posts the actual price. It posts the normal price and it posts the actual price. At times those prices are the same and at times they differ.

When Standard of Indiana says the normal price for Chicago is 12¢ but the actual price is 11¢, it is the actual price at which gasoline is sold. The 12¢ price is not a theoretical price. Sometimes gasoline is sold at 12¢, but not when the actual posted price differs. Assuming that on this day the normal posted price is 12¢, and there is an actual price of 11¢ that is posted on the same day by Standard Oil Company of Indiana, then the price paid is the actual price.

I don't agree that the posted price is a theoretical price. I wouldn't say either that it is the price that Standard of Indiana would like to have prevail on that day.

(Tabulation was produced and marked Exhibit 1015 for identification.)

Exhibit 1015 for identification was prepared under my direction. The figures shown thereon are taken from the Sinclair purchase orders, from the impounded records of Sinclair, that are here in Madison. The figures shown on there are correct.

This Exhibit covers the entire calendar year 1935, and the first 4 months of 1936; that is, from January 1, 1935 to April 30, 1936.

I have divided the figures showing the quantities of gasoline purchased as between January and February, 1935, before there is any charge that there was any buying program here, and the purchases that were made during the 14 succeeding months.

I know that all of the Sinclair purchase orders and purchase data that was subpoenaed by the Government and impounded, covering the period ending April 30, 1936, have been introduced in evidence, and the period covered here includes the period covered by those impounded documents, with the exception of December, 1934 and a portion of November, 1934. We did not, in this tabulation, include the purchase data for that portion of November, 1934, and for December, 1934, because we were so pressed for time that we confined our examination to the years 1935 and 1936. We didn't make any audit back of January 1, 1935.

3069 The total quantity of gasoline purchased in the Mid-Continent field by Sinclair Refining Company for January and February, 1935, before there is supposed to have been any buying program, in gallons, was 7,167,407. That is an average of 3,583,703 gallons per month. The total purchases during the 14 months covered by the impounded figures, during the supposed operation of the buying program, namely, from March 1, 1935 to April 30, 1936, were 50,065,388 gallons. The average purchases per month during that period were 3,578,956 gallons.

The average gallonage purchased for the first 2 months of 1935, before the buying program was supposed to be in operation, was 3,583,703 gallons. The average for the first 2 months of 1936, was 3,204,954 gallons.

On this exhibit I have divided these purchases up as among different classes of suppliers in the Mid-Continent field for the 14 months period from March 1, 1935, and I have shown the total gallonage purchased from each of the several classes of suppliers.

We divided the suppliers into 3 types. First, the independent refiners named in paragraph 22 of the indictment. The percentage of the total purchases made from them was less than 31%.

The next class is "Other independent refiners." They would be independent refiners in the Mid-Continent field, other than the 14 that are specifically named in paragraph 22 of the indictment. The percentage of the total purchases made from them was over 53%.

3070 During that period Sinclair Refining Company bought gasoline from major companies as well as from independent refiners. The percentage of its total purchases made from other major companies was over 16%.

The purchases made from all independent refiners, both named and not named, was about 84%; as compared with about 16% purchased through major companies.

On this Exhibit I have also listed the names of the companies, both independents and majors, from which Sinclair bought gasoline in the Mid-Continent field in the 14 months from March 1, 1935 to April 30, 1936. There were 14 independent refiners named in the indictment in the Mid-

Continent field, and Sinclair purchased from all of those except 4. In addition to that, it purchased from 25 other independent refiners in the Mid-Continent field, which were not named in the indictment, and from some majors also. The total number of independent refiners in the Mid-Continent field from which Sinclair bought gasoline during those months was 35.

I would include North Texas as being in the Mid-Continent field. The refiners shown on this Exhibit as being located in Texas are in North Texas and not East Texas. There were 4 major companies from whom Sinclair purchased gasoline during this 14 months period; Continental Oil, Gulf, Louisiana Oil and Phillips Petroleum.

A considerable part of the Government's statistical 3071 evidence in respect to purchases has been stated in terms of cars. I have reduced this Exhibit 1015, which shows purchases in gallons, to a car basis, by dividing the gallonage by 8,000, which is the customary way of reducing gallons to tank cars.

For the first 2 months of 1935 there was a total of 895 cars purchased, which would be an average of 447 cars for those 2 months. The purchases in the first 2 months of 1936 would be 801 cars, which would be an average of 400 cars. So that the average for the first 2 months of 1935, which is 447 cars, would compare with the average for the first 2 months of 1936, of 400 cars.

The total purchases for that 14 months period succeeding March 1st would be 6,259 cars, which is a monthly average of 447 cars, which is exactly the same as the average for the first 2 months of 1935.

I have split up these purchases during the 14 months period in terms of cars as between the several classes of suppliers concerning whom I testified. The purchases from independent refiners named in the indictment would be the equivalent of 1,918 cars, and from other independent refiners in the Mid-Continent field, 3,329 cars. Making a total from all independent refiners of 5,247 cars. In addition to that there was purchased from major companies 1,012 cars, making an over-all total for that 14 months period of 6,259 cars.

(Document, previously so marked for identification, is received in evidence as EXHIBIT 1015).

3072 *Cross-Examination by Mr. Chaffetz.*

As to the purchases of gasoline referred to in Exhibit 1015, the purchase price would certainly have some relationship to the spot market.

Group 3 is not merely the Oklahoma spot market.

I am talking about refiners markets. You were talking about Mid-Continent, which will include a lot of different refinery markets. And Group 3—you can have a market in Chicago that would be a Group 3 market. If you bought in Chicago or in Louisiana, on the basis of Group 3, you would be buying on the basis of Group 3, but that is not the Oklahoma market. Group 3 is a freight basing point which includes a certain number of shipping points within a large area in Oklahoma, and extends over slightly into the northern part of Texas.

From those shipping points, to points north, the freight rate is the same, no matter which point of origin you use. Not only can you ship gasoline from those points on this freight rate, but sometimes a man in Chicago will buy gasoline in Kansas, and will buy it on a basis of f.o.b. Group 3.

Exhibit 1015 shows gasoline purchases that were made within the Mid-Continent fields. It includes all purchases within the Mid-Continent field. And I can say they were not all bought on the basis of Group 3.

3073 *Direct Examination by Mr. Donovan.*

I am familiar with the testimony of Carl Beroth of Acme Petroleum Company, in respect to his business relations during 1935 and 1936, with certain of the East Texas and Mid-Continent independent refiners.

I have made audits of the sales to jobbers, consumers and brokers, made between November 1, 1934 and July 30, 1936, by certain of the independent refiners referred to by Mr. Beroth in his testimony. Specifically, I have made an audit of such sales by East Texas Refining Company, McMurray Refining Company, Grogan Oil Company, Bell Oil and Gas Company, Olney Oil and Refining Company, Cushing Refining and Gasoline Company, Danciger Oil and Refining Company, Inc., and Omar Refining Company for that period. We made the audits right down in the offices of those various refiners, but the records upon which they were based are now here in Madison. Some of them are in the custody of the Clerk, and some are in my possession. We have them available for use by the Government.

companies from the East Texas and Mid-Continent independent refiners during 1935 and 1936. Most of the records upon which those audits were made are here in the custody of this Court.

According to my audit, East Texas Refining Company did not sell any gasoline to Mr. Beroth's company between November 1, 1934 and the end of July, 1936. East Texas Refining Company sold a considerable quantity of gasoline
to other brokers during this time. It sold 11,097,761
3074 gallons to brokers in the calendar year 1935. But
covering the entire period of our audit, that is, for the 21 months from November 1, 1934 to July 31, 1936, it sold 13,257,890 gallons to brokers.

27 different brokers bought gasoline from East Texas Refining Company in 1935. East Texas Refining Company sold 2,869,995 gallons to the defendants in 1935. It sold nearly 4 times as much to brokers as it did to the present defendants.

During 1935 McMurray Refining Company sold to the defendants now on trial 746,332 gallons. During that time it sold 4 cars, 32,011 gallons of gasoline, to Mr. Beroth's company. McMurray Refining Company sold to all brokers in 1935, 1,736,548 gallons, which would be about 215 cars. That is the year's sales. It dealt with 17 brokers besides Mr. Beroth's company.

Cascade Refining Company sold 440,413 gallons of gasoline to major companies during 1935; about 55 tank cars. From what I know of the size of shipments made by the average independent refiner, that was not a large amount of gasoline. I wouldn't be able to say what their total shipment to all buyers were that year, but I know they have a refinery capacity of about 2,000 barrels, so 55 cars wouldn't be a large amount.

I am familiar with Mr. Beroth's testimony as to his relations with Grogan Oil Company in 1935 and 1936. On his direct examination he said that 4 or 5 times, both in 1935
and 1936, Grogan advised him that they had sold bulk
3075 products to the major companies, and he said that he
was in their refinery in Shreveport, and saw Cities Service cars, and Grogan told him that the gasoline was going out to them, and therefore he had none to sell Beroth.

That Grogan Company has a number of subsidiaries. It sells the output of several refiners; Hurricane, Trio and Rodessa. In 1935 and 1936 they were selling the output of those three refiners.

The business that those three refiners did was through the Grogan office.

The Grogan Company and its subsidiaries sold to Cities Service during 1935, 282,559 gallons of gasoline, about 35 cars. For all the defendants that would be 9,903,826 gallons. They sold 12,241,320 gallons to brokers in 1935. So it would appear that the bulk of Grogan's production in 1935 was not going to major companies.

Of that 12,000,000 and over that Grogan sold to brokers in 1935, Beroth's company, Acme Petroleum, bought 738,869 gallons. In 1935 Grogan's office was dealing with 50 different brokers.

During 1935 Trinity Refining Company did not sell any gasoline to the defendants, none at all.

Ocean Petroleum Company sold 30 cars of gasoline to defendants throughout 1935. That company has a capacity of 3,000 barrels daily.

I am talking about the present defendants when I
3076 say "defendants." That excludes Gulf and Texas and Louisiana Oil. I included all the original defendants with the exception of the 6 that are no longer in the case. I excluded Tide Water, too.

I am familiar with Mr. Beroth's testimony as to his efforts to purchase gasoline after March 1, 1935, from Bell Oil & Gas Company.

Bell sold approximately 30% of its gasoline by truck, according to a stipulation in this case. Their truck sales were about 30% of their total sales. Eliminating those truck sales, and comparing the remainder with the gasoline bought by the defendants, the defendants purchased about 12% of Bell's total sales during the year.

According to my audits, Olney Oil & Refining Company sold 4,443,900 gallons to the defendants during 1935. And during the same year they sold 4,487,477 gallons to brokers. So they sold more to brokers during that year than they sold to the defendants. Of the gasoline that they sold to brokers they sold 121,869 gallons to Mr. Beroth's company. Olney dealt with 13 brokers that year, including Acme Petroleum Corporation. So, although they sold 121,000 gallons to Acme, they sold a lot more gasoline to other brokers during the year. Acme got a very small part of Olney's total sales to brokers.

Cushing Refining & Gasoline Company sold 3,741,534 gallons to the defendant companies during 1935. It sold 6,098,060 gallons to brokers during that period; nearly
3077 twice as much to brokers in 1935 as to defendant companies.

Out of the 6,000,000 and some odd gallons that Cushing sold to brokers in 1935, it sold 236,003 gallons to Acme

Petroleum Corporation. Cushing did business with approximately 23 brokers in 1935, including Acme.

I think Mr. Beroth said in his testimony that he did not contact Danciger Oil and Refiners, Inc.; he just passed them up. Danciger sold brokers over 4,000,000 gallons of gasoline in 1935.

In Beroth's testimony with respect to Omar Refinery, he said he did not try to buy from Omar during 1935 and 1936; that Omar had certain contracts which took the major part of their gasoline, so that Beroth thought it useless to solicit them. Omar sold 3,381,545 gallons of gasoline to brokers during 1935.

I want to make some corrections in the record. At the opening of the session this morning I had discussed Exhibits 874, 875, 876, and 877, and I neglected to mention that those exhibits cover purchases made by major companies from both independent refiners and brokers. I do not believe this was clear during my testimony and from the Exhibits.

I testified yesterday that Government Exhibits 747 to 751, both inclusive, purporting to show the amount of purchases by the defendant companies other than Sinclair went as far only as April 30, 1936. I have made a study of
3078 the amount of major company purchases from then
to the end of 1936. The average monthly purchases for the last 8 months of 1936 ran around 2,000 cars a month. Our independent audit for that period from March, 1935 to April, 1936, indicates that the major purchases averaged around 1,700 cars a month. Now, that is somewhat more than what the Government audit shows. That difference may be attributed to the fact that we are taking all purchases of gasoline irrespective of grade. The Government audit purports to show the volume of purchases limited to regular grade and third grade gasoline. We are taking all gasoline.

In the last 8 months of 1936 the volume of purchases ran around 300 cars a month more than it did in the 14 months preceding. After April 30, 1936 these defendants were purchasing more gasoline from independent refiners and brokers than they had been before.

I have taken the Government audit and determined the average purchase per month by adding to their figures Sinclair's purchases as we determined them. I have taken it in two different ways. I have taken their figures and added Sinclair's figures, and then I have taken our own figures, including Sinclair.

I have taken the Government figures, added Sinclair, and found that the purchases in the last 8 months of 1936 were about 27% greater than for the 14 months preceding.

Taking my own determination of the volume of the buying by the majors in that 14 months period, I find that 3079 the increase was about 17% in the latter part of 1936.

Taking the Government's audit, eliminating the purchases made by certain majors which are no longer defendants, and then adding to that the purchases by Sinclair, I have arrived at a monthly average of a little less than 1,600 cars during the period March, 1935 to April 30, 1936. My own audit, taking all the gasoline into account, not limiting it merely to third grade and regular grade, shows about 1,700 cars a month. That would mean that in the 8 months after April 30, 1936 the defendant purchases from independent refiners averaged from 300 to 400 cars more.

The course of prices for gasoline during May, June, July, August and September, 1936 was generally downward. The published quotations show a drop for both grades of gasoline of about ½¢ a gallon. When I say both grades, I mean regular grade and third grade.

For that 5 months period alone, the average monthly purchases of gasoline by these defendants from independent refiners was still higher. It ran around 2,300 to 2,400 cars a month. This 5 months period in 1936 shows an increase over the similar period in 1935 of about 650 cars a month. That is based on my own figures. But my figures are higher than the Government's as to volume; so that, basing it on the Government figures, the difference would be even greater. And during that time in 1936 the market was going down.

3080 I have made a comparison between the average purchases during this 5 months period when the price was going down and the average purchases during March, April and May, 1935 when the market was going up. In March, April and May, 1935 when the market was going up, the majors were buying from 800 to 900 cars a month less than during the middle of 1936, when prices were going down. The buying in 1936, when the market was going down, in volume was about 53% higher than it was in the spring of 1935, when the prices were going up.

Tank car prices of both grades of gasoline, that is, regular and third grade, advanced ¼¢ in the last 3 months of 1936. The major volume of buying from independent refiners was much less in the last 3 months of 1936 than in the preceding 5 months, when the market went down ½¢. It averaged about 1400 cars a month, whereas the average for the 5 months before that, when the price was going down, was around 2350 cars.

There was a decline in the monthly rate of buying by the majors in the last 3 months of 1936 of more than 900 cars a month, which is equivalent to about a 38% decrease in volume of buying. In spite of the decrease in the amount of purchases, the market went up.

I am familiar with the testimony given by Mr. Arthur Dyer with respect to the total quantities of gasoline sold during 1935 by those East Texas refiners specifically named in the indictment, and also by all of the East Texas 3081 refiners, including those actually named in the indictment. Mr. Dyer testified that the total gasoline sold in 1935 by the East Texas refiners named in the indictment was 285,592,188 gallons, and that the total gasoline sold in that year by all the East Texas refiners was 378,920,346 gallons.

I am familiar with the allegations of Paragraph 21 of the indictment that the quantities of gasoline purchased by the defendants from the East Texas independent refiners, members of the East Texas Refiners' Association, amounted to more than 50% of all the gasoline produced by those refiners.

From my audit I can tell you how much gasoline was purchased by the present defendants in 1935: first, from the East Texas independent refiners specifically named in the indictment; and, second, from all East Texas independent refiners. The present defendant major companies bought 40,195,754 gallons from the East Texas independent refiners named in the indictment. From all East Texas refiners they bought a total of 45,598,453 gallons.

I have prepared charts showing the comparison between those amounts of gasoline sold by the East Texas independent refiners in 1935 and the amounts which I have mentioned which were purchased by the defendant major oil companies. Exhibit 1018 for identification shows the total gasoline shipments by those East Texas independent refiners named in the indictment: that is, about 22 3082 independent refiners; and, of course, we are dealing with the year 1935. That shows that the total shipments of those independent refiners amounted to 285,592,199 gallons. That figure is shown up here at the top (indicating).

This chart is drawn in such a manner that this total distance from the top to the bottom indicates a volume of 285,000,000 gallons.

proportion of those total sales by all that group of independent refiners was taken by the major companies. That amounts to 40,195,754 gallons; and in per cent, that is 14.07. In other words, out of the total sales by those East Texas independent refiners named in the indictment the present defendant majors took 14%.

Exhibit 1017 for identification deals with the same period of time, that is, 1935. It also deals with East Texas independent refiners, but it covers all East Texas independent refiners, and it shows that their total sales for the year 1935 amounted to 378,920,346 gallons. Of those total sales, the present defendant majors took 45,598,453 gallons. That is just a trifle over 12%.

This chart is drawn to scale. The distance from the bottom to the top represents the total sales volume of 378,000,000 (indicating); and the part that the majors took,
that is, the 45,000,000, which is 12%, is this red portion
3083 here (indicating) at the bottom. That shows graph-
a ically the proportion of the total sales that the present
defendant majors took.

By the Court

I have never made a computation as to how much of that blue is represented by the sales made to the Gulf, Texaco and Tide Water. It can be made, but I have never made it. These were made up recently; they were not made a long time ago while those companies were still defendants.

Cross-Examination by Mr. Chaffetz.

I left out Cities Service Export from the red because it is no longer a present defendant company. I do not know whether or not Cities Service Export Company participated in the buying movement charged in the indictment during 1935. I don't know whether Tide Water or Louisiana Oil & Refining Company did. I am limiting this to the present defendants.

This chart, Exhibit 1017, covers all of the production of the independent refiners in East Texas. It covers all the production of the independent refiners to whom it refers; it covers both their sales in interstate commerce and their local trucking sales. I understand that some of the independent refiners in East Texas do a very large local trucking business. I wouldn't say I know it.

3084 *Direct Examination by Mr. Donovan (Continued).*

(Charts referred to received in evidence as EXHIBITS 1017 and 1018.)

I have made myself familiar with the testimony and exhibits in this case relative to the total gasoline sales made during 1935 and 1936 by a number of Mid-Continent refiners. I will read the list of the Mid-Continent refiners I refer to in this connection: Anderson-Prichard Refining Company, Coltex Refining Company, Bell Oil & Gas Refining Company, Black Gold Refining Company, Champlin Refining Company, Cosden Petroleum Company, Cushing Refining & Gasoline Company, Danciger Oil & Refineries, Inc., Deep Rock Oil Corporation, Derby Oil Company, Dickey Oil Company, Eason Oil Company, El Dorado Refining Company, Johnson Oil & Refining Company, Kanotex Refining Company, Lion Oil Refining Company, Olney Oil & Refining Company, Omar Refining Company, Panhandle Refining Company, Rock Island Refining Company, Rodessa Oil & Refining Company, Root Petroleum Company, Shamrock Oil & Gas Company, Sun Company, Sun-Ray Oil Company, Vickers Petroleum Company, Waggoner Refining Company, and Wilcox Oil & Gas Company.

In addition to those refiners whom I have just mentioned, I have figures showing gasoline sales by the Taxman Company for the entire year of 1935, and 1936 down to July 31st. The Taxman Company was at that time an independent refiner operating in the Mid-Continent field. It is shut down now. We made an audit of Taxman Refining Company from November 1, 1934 down to July 31,
3085 1936. We have attempted to secure further figures for the remainder of 1936, but were unable to do so because the refinery is out of business. I believe it is being scrapped at the present time.

I have looked at the way the indictment defines the Mid-Continent field as including Oklahoma, North and West Texas, and southern and eastern Kansas, southern Arkansas, and northern Louisiana. All these refineries are located in the Mid-Continent field as defined by this indictment, and all of them are independent refiners as defined in the indictment, all those I read off with the exception of Deep Rock. The testimony in this case is that Deep Rock is to be classified as semi-major.

From the standpoint of sales volume in 1935 and 1936 Deep Rock, compared with the independent refiners operating in the Mid-Continent field, was about the same size, although with smaller refinery capacity, as Champlin, Lion, Coltex, Cosden, Kanotex, and Root Petroleum.

I believe that during the period covered by the indictment the defendant companies bought gasoline at one time or another from all but two of the independents that I have named. I am not sure about Derby. I don't think they did from Eldorado or Sun.

I would consider Sun in the eastern part of the United States as a major company, but here in the west, they have
a small refinery at Yale, Oklahoma. It has a crude
3086 capacity of about 5,000 barrels. It isn't engaged in
marketing, and it sold its entire output on the spot
market, and practically all of it in the Standard of Indiana territory. I think it is to be classified, in so far as its Yale, Oklahoma, refinery is concerned, as an independent.

The Globe Company of Illinois made some purchases, I think, from Sun; I don't recall whether those purchases were made out of the Yale, Oklahoma refinery. They may have been; I am not sure about that.

This list of 29 refiners does not include all the small refiners that were operating in the Mid-Continent field in 1935 and 1936. There is a much larger list than that. This is just a partial list of the Mid-Continent independent refiners. These refiners which I have named include all the Mid-Continent independent refiners which are specifically named in the indictment.

Fourteen Mid-Continent independent refiners, which are included in this list, are specifically named in the indictment. The total gasoline sold in 1935 by these 29 independent refiners was 903,296,529 gallons. In 1936, it was 1,004,006,200 gallons.

The 14 named in the indictment would be a representative group of the whole number from the standpoint of crude capacity, the operating rate; from the geographical location and the market outlets that they would normally have.

The Mid-Continent refiners specifically named in the
3087 indictment in 1935 sold 377,988,736 gallons of gaso-
line; in 1936, 416,923,200 gallons.

I have seen the allegations in paragraph 23 of the indictment that the defendants purchased from the Mid-Continent independent refiners in the alleged buying program nearly 50% of the gasoline sold by said Mid-Continent independent refiners.

From my audit I can tell you how much gasoline was purchased by the defendant major companies in 1935 and in 1936 from those 29 Mid-Continent small refiners. In

1935, those purchases amounted to 93,394,727 gallons; in 1936, 109,378,261 gallons.

If I were to limit the amounts of gasoline purchased by the defendant companies to those Mid-Continent independent refiners named as alleged co-conspirators in the indictment, the amounts would be: for 1935, 64,440,712 gallons, and for 1936, 80,240,958 gallons.

I have prepared charts showing these comparisons.

(Charts referred to received in evidence as EXHIBITS 1019, 1020, 1021 and 1022, respectively.)

Exhibit 1023 for identification shows the 6 chart Exhibits all drawn to the same scale.

(Chart referred to received in evidence as EXHIBIT 1023.)

Exhibit 1019 relates to the 14 Mid-Continent independent refiners named in the indictment and shows that 17% of their total sales in 1935 was taken by the defendant
3088 major companies. The red area here indicates what proportion of the total the majors took. That would mean that those 14 independent refiners sold to other customers practically 83% of their total sales.

Exhibit 1022, covering 1935, relates to all 29 Mid-Continent independent refiners, including the 14 that are shown on Exhibit 1019. The chart shows that of their total sales the defendant major companies took a little over 10%. The red area at the bottom of the chart indicates the relative portion of the total that the defendant majors took. So those 29 independent refiners sold to other customers almost 90% of their total output.

Exhibit 1020 covers the 1936 sales of those Mid-Continent independent refiners named in the indictment, and shows that 19% of their total sales was taken by the defendant major companies. So those 14 Mid-Continent independent refiners named in the indictment sold to other customers about 81% of their output in 1936.

Exhibit 1021 covers the 1936 total sales of all 29 Mid-Continent independent refiners and shows that less than 11% of those sales were taken by the defendant major companies. So those 29 Mid-Continent independent refiners sold elsewhere to other customers over 89% of their output for 1936.

I have no chart for 1936 in East Texas because I don't believe that Mr. Dyer testified as to any figures of gasoline shipped out of the East Texas field in 1936, so that we had no basic figures to work on. We only had them for 1935.

3089 *Cross-Examination by Mr. Chaffetz.*

Exhibit 1021 covers all the sales, whether or not they were sales in the Indiana territory, that were made by that particular group of independent refiners. It includes truck sales as well as tank car sales. I know that most of those Mid-Continent refiners I referred to do a substantial business in the Indiana territory. I don't know that all of them do.

I know the extent to which particular companies located in Arkansas and northern Louisiana do business in the Indiana territory. I wouldn't say that I know what all of them do. It might be that some of them don't do a very large part of their business in Indiana territory. I wouldn't say that their market is largely to the southeast of where they are located. Their logical market would be where they have a freight differential, and they would have a freight differential in Louisiana, Arkansas and northern Missouri. But they could well be doing business throughout the Standard of Indiana territory.

Direct Examination by Mr. Donovan (Resumed).

Q. I just want to call your attention to page 22 of the indictment, paragraph 23, and direct your attention to the allegation that the "said quantities 3090 of gasoline purchased from said independent refiners in said buying program have amounted to nearly 50% of all the gasoline sold by said independent refiners."

It was upon that allegation that you made your calculation~~;~~ is that correct?

A. Yes, insofar as the total sales by those independent refiners were concerned.

Mr. Chaffetz: Q. Those that were named in the indictment?

A. Well, no; all independent refiners. I took all their sales just as the indictment reads.

Mr. Donovan: Q. On page 9, allegation 6, I direct your attention to the allegation that: "Refineries are also located in the aforementioned crude producing states"—that being Louisiana and Arkansas as named in the early part of paragraph 6. Is that correct?

A. That is correct.

Q. (Continuing reading) "and substantial quantities of gasoline so manufactured in those states are transported in interstate commerce, principally by tank car, into each of the states in the aforesaid Mid-Western area."

It was upon that you based your calculations in the Mid-Continent field?

A. Yes.

3091 Mr. Chaffetz: Q. That allegation does not say that all the independent refiners in the states of Louisiana and Arkansas sell any substantial part of their gasoline in the Indiana territory, does it?

A. No, it does not single out any one refinery.

By Mr. Donovan

I have now made a computation indicating how much of the blue portion of those charts indicates sales to dismissed defendant companies.

During 1935 the East Texas independent refiners sold to those defendant major companies who have been dismissed from the case: Cities Service Export Oil Company 7,782,025 gallons; Louisiana Oil and Refining Company 11,158,406 gallons; Tide Water Oil Company 6,539,123 gallons; Gulf Refining Company 17,824,000; Texas Company 4,986,011 gallons. That is a total to those 5 major companies which were originally defendants in this case, and are no longer defendants, of 48,289,565 gallons.

With Gulf and Texas out the total would be reduced. That would leave 3 majors, that is, Cities Service Export Oil, Louisiana Oil and Tide Water Oil. The total for those 3 would be 25,479,554 gallons.

Exhibit 1017 shows that the majors that are still defendants in the case took 12% of the total sales of all East Texas independent refiners. If we include the purchases
made by these 5 major companies which were origi-
3092 nally defendants in the case, and are no longer de-
fendants in the case, that percentage would be increased from a little over 12% to less than 25%. The indictment alleges that these companies bought 50% of all the gasoline produced by the East Texas refiners.

Confined to the defendant majors exclusive of Gulf and Texas the percentage would be increased by less than 7%. In other words, it would still be under 19% of the total. That is, with Texas and Gulf alone out and all other original defendants in.

Exhibit 1022 shows that the major companies still defendants in the case took from the Mid-Continent independent refiners about 93,000,000 gallons out of a total of over 900,000,000 gallons. That is, they took about 10%.

This Exhibit 1022 is limited to the majors that are still defendants. But if we add to that the purchases by the 6 majors that were originally defendants, and no longer defendants, that would make the total gallonage by the original defendant major companies 103,732,164. Now, that would be an increase of just a little over 1%. That would be about 11½% of the total, instead of 50% as is alleged in the indictment.

Exhibit 1019 is the chart as to the Mid-Continent refineries specifically named in the indictment. That shows that the present defendant major companies bought about 64,400,000 gallons out of a total of about 378,000,000 gallons, and that was about 17%. The major companies that were originally defendants and are now out of the case bought only 403,348 gallons, and it is just about 1/10 of 1%, 3093 so that the inclusion of those major companies on this chart would not affect the red area perceptibly. In fact, it would make practically no difference in that percentage, to include all the original defendants. So that computation, instead of 50% as alleged in the indictment, would be slightly over 17%.

As to the figures with respect to Tide Water, I refer to Government Exhibits, their audit, Exhibits 747 to 751. That shows the quantities in tank cars purchased by Tide Water in the East Texas field. It was a very small number of cars. I do not recall the exact number, but it was very small.

According to Government Exhibit 750, 15 cars were bought by Tide Water in the Mid-Continent field; 15 cars in the entire 14 month period.

The company that did buy in the Mid-Continent was Tide Water of Oklahoma. I don't know whether it was indicted or not.

At your request I have made an investigation to determine whether or not the defendant major oil companies purchased from independent refiners at high, arbitrary and uniform prices during 1935 and 1936, as charged in paragraphs 21 and 25 of the indictment.

We made an audit to see what prices were paid for third grade and regular gasoline by the defendant com- 3094 panies in their purchases from independent refiners and brokers in the Mid-Continent and East Texas fields during 1935 and 1936.

In addition to that we made an audit of sales, I think it was by 27 Mid-Continent and East Texas refiners to jobbers and consumers and brokers covering the period of 21 months, from November 1, 1934 on down to July 31, 1936.

We wanted to see what the majors really did pay when they bought gasoline from these independent refiners, to see whether they paid a high price, whether they paid a uniform price, and whether there was anything arbitrary about the price. Then we wanted to see what the independent refiners sold the jobbers and consumers for, because that was what the publications based their quotations on, the spot sales by independent refiners, and, of course, brokers and major companies as well. But it is the sales by refiners and brokers, and when I say "refiners", that is majors and independent refiners; it is those sales to the jobbers and consumers that are reflected in the trade publication quotations. We went and examined to see what they really sold to this type of customer at, and compared those sales prices with the quotations.

I have not completed those audits, but I have got through the entire year of 1935 and some portions of 1936. My audit for the price of third grade and regular gasoline paid by the defendant companies for purchases from
3095 independent refiners was based on invoices, purchase
orders, and possibly confirmations of the purchase orders. The independent refiner might secure a sales confirmation upon receipt of the order. We would examine that. There are certain of those records now impounded in this court.

My audit of the prices paid by jobbers and consumers in their purchases from independent refiners was based on the records of the independent refiners themselves. We went into the offices of independent refiners and examined their records to see just what they were selling to jobbers and consumers for. I have here our records upon which we based that audit in that respect. They are here and available to the Government.

I have prepared charts showing the prices paid in the spot market for third grade and regular gasoline during 1935 by the defendant companies, and also the prices paid in the spot market by jobbers and consumers for third grade and regular gasoline during the same period, if you limit spot sales to flat price sales, and further limit them to Group 3 and Oklahoma refinery f. o. b. points.

These charts show all flat price purchases made by the defendant major companies from independent refiners, and those purchases are not merely confined to the Mid-Continent field. They include purchases made in the East Texas field if they were made on an f. o. b. Group 3 basis. And of course they include purchases made in the Mid-Continent

field only if they were made on an f. o. b. Group 3
3096 basis, or f. o. b. refinery basis at the Oklahoma
refinery.

The purchases on these charts were limited to purchases f. o. b. Group 3 and f. o. b. Oklahoma refinery, because these charts have superimposed on them the daily price quotations appearing in the Chicago Journal of Commerce and Platt's Oilgram for the Oklahoma refinery market throughout the year 1935, and we have included in these charts only such spot sales as could properly compare with those trade publication prices.

These major purchases in East Texas were not disclosed on the chart I talked about yesterday. That chart yesterday, insofar as the East Texas field is concerned, was limited to sales made at a flat price f. o. b. refinery out of East Texas. Now, I have made another chart that does include purchases made in the East Texas field but upon an f. o. b. Group 3 basis, so there is no duplication in those purchases. They are entirely different, that is, the shipments have different f. o. b. points. Those two charts together will show all the East Texas purchases. They are two charts on one piece of paper, they are really a duplicate chart.

(Chart referred to is marked Exhibit 1024 for identification.)

The upper chart is the upper half, that is, this part up
here, the "defendant major oil companies". That
3097 represents and contains the flat price purchases by
defendant major oil companies. Now, first, it is limited to regular grade and third grade gasoline, so that, if there were any purchases made by major companies of gasoline other than regular grade or third grade, they would not be reflected on this chart. The reason for that is that there are graphs here showing the quotations of the trade publications for only two grades of gasoline, regular grade and third grade. Those are the two grades mentioned in the indictment. So, we put on this chart only those two grades of gasoline, which are comparable to the quotations, the price range. So we eliminated anything that was not third grade gasoline or was not regular grade gasoline.

Now, there is nothing on the chart that wasn't bought on a flat price. That would exclude any purchases made on a publication basis. By this I mean any purchase at a price to be determined not at the time the purchase is made, but at the time the shipment is made, and then based on a published quotation. It does include purchases made at a flat price from independent refiners and brokers.

There is nothing on that chart that wasn't bought either f. o. b. Group 3 or f. o. b. refinery out of an Oklahoma refinery.

F. o. b. Group 3 would mean this, that if a refinery was located, say, in North Texas, the refiner would have to bear the freight cost as far as a point equivalent to Group 3.

That is practically the same for the East Texas re-
3098 finery, because we have had testimony that there is a
freight differential of about ⅛¢. If it was a refinery located in East Texas, selling gasoline for northern shipment, that East Texas refinery would have to bear the freight cost to equalize with Group 3. Group 3 is Oklahoma. And the freight from Oklahoma north is the equivalent of ⅛¢ less than it is from East Texas north, so that the refinery in East Texas, if it was selling at identically the same price as the refinery in Oklahoma, would be receiving about ⅛¢ less, net, for his gasoline than the Oklahoma refinery. In other words, the Oklahoma refiner has a freight differential advantage over the East Texas refiner of about ⅛¢ on a northern shipment.

F. o. b. refinery means that there is no factor of freight entering into the transaction at all. The buyer agrees to purchase that gasoline at so much and to stand the freight from the refinery to the ultimate destination. The shipper has nothing to do with freight at all. He gets a flat price at so much. That is what he gets for his gasoline.

So, with these eliminations I have described, the top part of the chart shows the flat price purchases of third grade and regular grade gasoline by defendant companies in 1935 from independent refiners and brokers in the Mid-Continent and the East Texas field on an f. o. b. Group 3 or f. o. b. Oklahoma refinery basis.

3099 The lower chart shows purchases by jobbers and consumers from independent refiners, and is based on an audit of sales from independent refiners and brokers.

We audited Bell Oil & Gas Company, whose refineries are located in North Texas and the Panhandle; Champlin Refining Company, whose refinery is located in Oklahoma; Cushing Refining & Gasoline Company, which has two refineries in Oklahoma; Danciger Oil & Refineries, Inc., which has a refinery in the Panhandle of Texas and in the East Texas field, and, in addition to that, does a certain amount of brokerage business. That independent is referred to in the indictment as Danciger Oil & Refining Company. I believe its name was changed several times, but they are one and the same. That is, the one that is named in the indictment is the one we audited. Dickey Oil & Refining Company has its refinery located in Kansas; Eason Oil Company in Oklahoma; Olney Oil & Refining Company in North Texas and the Panhandle; Omar Refining Company in Oklahoma; Panhandle Refining Company in North Texas and the Panhandle; Rock Island Refining Company in Oklahoma; Shamrock Oil & Gas Company in the Panhandle; Taxman Refining Company in North Texas; Waggoner Refining Company in North Texas; and Wilcox Oil & Gas Company in Oklahoma.

Now, all those 14 independent refiners are named in paragraph 2 of the indictment. They are named as alleged co-conspirators. And they are scattered all through
3100 North Texas, the Panhandle, Oklahoma, and Kansas.

We audited sales of other companies that are not named in the indictment. We audited Vickers Petroleum Company, located in Kansas, and Rodessa Refining Company, located in Louisiana. They are Mid-Continent refiners not named in the indictment.

We audited Tansel Petroleum Company, which is a broker, but that audit was very abbreviated because we went into the period of 1935 when the market was advancing.

Then, of course, we audited a certain number of East Texas refiners. Our audit of the East Texas refiners was limited quite considerably. We tried to cover all the 22 named in the indictment as alleged co-conspirators, but many of these were not operating to any substantial extent during the period covered by the indictment, due to the fact that they did not have Federal Tenders. Some of them have gone out of business since, or they have gone into consolidations, or for one reason or another, we were unable to secure access to their records.

The East Texas refiners whose books we did audit are East Texas Refining Company, Grogan Oil Company, McMurray Refining Company, Solvex Refining Company, Tyler-Texas Refining Company, Texas Oil Products Company, and Wabash Refining Company. In addition to that we audited the records of Marimac Oil Company, which is a broker selling the entire output of Wabash Refining
3101 Company. We audited Hurricane Petroleum Company and Trio Refining Company, which are tied in with Grogan Oil Company.

I wouldn't say that is an all-inclusive list of the Mid-Continent and East Texas refining companies which were operating in the Mid-Continent and East Texas fields during 1935 and 1936, but it is all-inclusive as to the ones we were able to get access to or which had records which could be audited at this late date. It covers practically all of those operating on Federal tenders in East Texas during that period.

Our audit included sales to jobbers and consumers by those independent refiners; and in addition to that we included Deep Rock Oil Corporation and two majors, where we had a record of their spot sales to jobbers and consumers.

Those majors were Mid-Continent Petroleum Company and Continental Oil Company. I didn't make the audits for those companies. They were testified to by the accountants of those companies, here on the stand. I testified as to the audit made by me of Deep Rock.

We did not include in our audit sales to jobbers or consumers by any other major or semi-major companies. Most of the majors that do any selling on the spot market to jobbers and consumers deliver out of cities other than those down in the Southwest; that is, out of such cities as Kansas City, St. Louis and Chicago. Their sales are not really on
a Group 3 basis. They require a lot of adjustments to
3102 work them back to a Group 3 basis.

The volume of sales made by Continental or Mid-Continent is just about on a par with those independent refiners, or perhaps might be a little less. Their spot sales would be similar to what these independent refiners did.

The first thing we did in making our audit was to secure and check all invoices. The invoices are invariably numbered consecutively. We first checked the numbers to make certain we had all invoices, in other words, all sales. Then we went through those invoices and eliminated the records of the transactions that we were not interested in. For instance, we were not interested in truck sales. So we eliminated any invoice that pertained to a truck sale. We were trying to limit our audit to tank car sales. We eliminated invoices covering sales of material other than gasoline. Now, a lot of the sales by independent refiners relate to kerosene, to naphtha, distillate, gas oil, fuel oil, and coke. We eliminated all of that sort of thing. My testimony as to the amounts of gasoline sold by the East Texas and Mid-Continent refiners as compared with the amount of gasoline bought from those refiners by certain of the present defendant companies, referred to sales to all other types of customers (including brokers) other than the defendant majors.

I testified that some of the sales on the chart, Exhibit

1024, were spot sales to jobbers and consumers, made
3103 by Continental Oil Company and Mid-Continent Oil
Corporation. I understood your question at that time to be that you wanted to know what the volume of spot sales by those majors might be. They might have been a great deal more than what is shown on this chart. As a matter of fact, the spot sales by, for instance, Continental Oil on this chart, is limited to about 15. Mid-Continent is small, too. Compared to the spot sales of independent refiners shown on this chart, the spot sales by these two companies were very small.

We came to Madison early in February, 1937 to start our audit of sales by these independent refiners to jobbers and consumers, which is the lower part of the chart. The reason we came to Madison was that at that time many of the records of the independent refiners were impounded here. We examined those records here, and then we found that the records that were here were incomplete, to make a detailed examination. We made an audit, and this is what we have.

We found, for instance, that there were some independent refiners as to which there were no records here at all in Madison such as, for instance, Wilcox Oil & Gas Company and Shamrock Oil & Gas Company. So we then went to the offices of these independent refiners that were named in the indictment and to the extent that we could secure access to the records, that would be all-inclusive as to the Mid-Continent field, we audited the records of sales to jobbers, brokers and consumers.

3104 We did omit an audit of jobbers where we found that they were under a formal contract, because we were not interested in contract sales; we were interested in the spot sales. Our audit covered a period from November 1, 1934, down to July 31, 1936, that is, a period of about 21 months.

We completed our field work in September, 1937, and since that time we have been engaged in tabulating the results of that field work, and building charts. The lower part of that chart is based upon that auditing work.

I wouldn't say that that chart shows purchases made by jobbers and consumers from brokers in the spot market. We have, of course, two independent refiners that conducted a certain amount of brokerage business, that is, Bell and Danciger; but the number of brokerage transactions in that chart is very, very limited.

The chart includes all transactions which we audited, and which were made between jobbers and consumers and the independent refiners which I have mentioned, all such transactions which were made at a flat price and f. o. b. Group 3, or f. o. b. refinery out of Oklahoma.

We eliminated some transactions. We didn't include any spot sales to brokers, and there would be a large number of those, because neither trade publication purports to reflect spot sales to brokers. The Chicago Journal of Commerce purports to reflect spot sales to jobbers and consumers, Platt's Oilgram purports to reflect spot sales
3105 to jobbers. So we had to eliminate certain types of customers.

And, even as to consumers, we eliminated certain types because the Journal, although it purports to report sales to consumers, means by that industrial consumers. It does not purport to cover sales to states or municipalities or other political subdivisions.

I am speaking now of the classes of customers that we eliminated. Then, of course, there are sales made to certain public utilities. A public utility might be called a consumer, and an industrial consumer; but very frequently sales were made to railroads on a competitive bid basis. A refiner, we will say, might be asked to make a bid, and might submit its bid today, but might not actually get that order for 2 weeks. The date of the order, then, would be 2 weeks hence, but that would not be representative of the market. It would have no bearing on the market, and would not be indicative of what the market was at the date the order was entered into, because the bid was made 2 weeks before that, based on current market conditions at the time the bid was put in. There were not a great many such transactions in comparison with these spot sales to jobbers. In any case, we eliminated them.

In 1935, the publications reported prices only on regular grade and third grade material. Of course, they also reported on special grades of material, such as 375 and 360 endpoint; but they did not report on what the refiners
3106 term intermediate bracket or intermediate grade; that would be gasoline falling within an octane range of 63 to 67. The trade publications did begin to report an intermediate bracket in April, 1936, but there were no published prices of that type of material in 1935. And, of course, the indictment mentions only regular grade and third grade. So we eliminated from consideration any intermediate bracket material, which would be 63 to 67 octane.

We eliminated, of course, all 375 and 360 endpoint gasoline, natural gasoline, and what you might call off-specification material, or unusual specification material. For instance, I previously pointed out that Danciger's East Columbia plant turned out a special type of gasoline that was of unusually high octane. Some of that was bought by Shell Company for aviation purposes. We eliminated that. We eliminated some of that unusual specification material that was sold by Deep Rock. For instance, Champlin made what they called 450 endpoint. That would be eliminated.

There were certain types of transactions that we eliminated. Any transaction made on a publication basis was eliminated. We confined ourselves to flat price transactions. Any time where the price was not fixed at the time the order was entered into, that would be eliminated.

Then, in addition to that, we would have sales made on written contracts, and the contract would specify how the
price was to be determined; that is, it was to be based
3107 on a publication, or maybe on the average of 2 publications.

Then some of these jobbers were under an informal agreement. Perhaps the agreement was evidenced by a letter, or it might be even oral.

We would not include any sale that was not made on an f. o. b. Group 3 basis or f. o. b. refinery out of Oklahoma.

I have stated that that chart, Exhibit 1024, showing purchases by major companies, does not show any purchases made by major companies where the price agreed on was the price to be published in the Chicago Journal of Commerce or some one of the trade publications on date of shipment. They are limited to flat price transactions. That is to say, that where the price agreed on was expressed as the low of the Journal, date of shipment, or ⅛¢ below the low of the Journal, date of shipment, or the average of the Journal, date of shipment; that is not on the chart. But I have audited the number of purchases made by major companies from independent refiners, where the parties agreed to pay for the gasoline on that basis, and I could furnish you with that information.

On January 10, 1935, the price of third grade had a range from 3¾¢ to 4¢. If a major company called up an independent refiner on that day and ordered 10 cars of gasoline to be shipped on January 21st, and agreed to pay the independent refiner the low of the Journal, date of shipment,
the price the major company would have paid the
3108 independent refiner for this gasoline on January 21st
would have been 3½¢. He would pay ¼¢ less than the low of the published quotations at the time the order was placed.

So when a buyer buys gasoline at the low of the Journal, date of shipment, the price which will be paid for that gasoline may be even lower than what the low of the Journal was at the time the gasoline was ordered.

If on March 1, 1935, a major company called up an independent refiner and ordered 10 cars of third grade gasoline to be shipped on March 8th, and agreed to pay the independent refiner the low of the Journal on date of shipment, the price the independent refiner would receive for its gasoline on March 8th would be 3⅝¢. That would be higher than the price quoted for third grade on March 1st, at the time this gasoline was ordered. On March 1st, the low of the Journal was 3¼¢, so it would be ⅜¢ higher.

It is true that when parties buy gasoline and agree to pay the low of the Journal, date of shipment, the price they actually pay may turn out to be higher or lower than the price for gasoline as quoted at the time the order was placed. There is no determination at the time the order is entered into. The seller does not know, then, how much he is going to get for it on the date of shipment, nor does the buyer know how much he is going to pay for it.

Mr. Chaffetz: Q. But both the buyer and seller know that that sale or that transaction is not going to influence the published market prices, no matter whether it is lower or higher than it was on the day of the order. 3109

A. It should not, no.

Mr. Donovan: Q. So a transaction of this kind does not set any price, or any fixed price for the gasoline, does it?

A. No, it should have no bearing whatever on the fixing of the market.

Q. In view of this question, let me direct your attention to paragraph 18 of the indictment, and specifically to the language of the first sentence of that paragraph, wherein it is stated the defendants have artificially raised and fixed said spot market tank car price of gasoline and have maintained said prices at artificially high and non-competitive levels agreed upon among them and have thereby intentionally increased and fixed the tank car prices of gasoline contracted to be sold in the Mid-Western area.

Now, that is what that indictment charges in part here. You have read that?

A. Yes, I have.

Q. Let's get back to our example of March 1 on your chart, and take our case where a major company agrees to buy 10 cars of gasoline, delivery on March 8, low of the Chicago Journal of Commerce 3110 on date of shipment. What was the price of third grade gasoline, on March 1, when this agreement was made?

A. You are talking about third grade, Colonel?

Q. Yes.

A. That would be 3¼¢.

Q. On that day how much did the buyer and seller agree to pay for this gasoline?

A. You are talking about a publication purchase?

Q. Yes.

A. There would be no agreement whatever as to price.

Q. Did they ever agree on any set price for that gasoline?

A. No.

Q. What did they agree to do?

A. They agreed that the price should be determined by a publication when shipment was eventually made.

Q. So that they did not set the price at the time they ordered the gasoline, they would pay for that gasoline; is that right?

A. No.

Q. Let me go back to that question of Mr. Lewin's; he said that if gasoline is sold at the low of the Chicago Journal of Commerce, date of shipment, it has effectually taken away that gasoline from 3111 any possibility of being sold at lower than the Chicago Journal of Commerce.

Now, let me ask you this: Has it or has it not also effectually taken away that gasoline from any possibility of being sold at higher than the Chicago Journal of Commerce?

A. It has, providing the sale has no effect on the operating rate of the refinery.

Q. Let's look at the black dots on that chart, showing sales made to jobbers at flat prices which were higher than the Chicago Journal of Commerce. If the companies making those sales had agreed to sell to those jobbers on the basis of the low of the Chicago Journal of Commerce, date of shipment, would it not have effectually taken away that gasoline from any possibility of having been sold at higher than the Chicago Journal of Commerce?

A. Yes, indeed.

During 1935 and 1936 jobbers bought gasoline from independent refiners on the basis of the low of the Journal, date of shipment. They made a lot of publication purchases. It wouldn't necessarily be limited to the Journal and would not necessarily be limited to the low of either publication. But they bought on a publication basis. That was a very frequent occurrence. In my chart showing purchases by jobbers, I have excluded such purchases as
3112 I have just described in the same way as I excluded
such purchases from my major companies chart. Every transaction on there is a flat price, whether it is on the lower part of the chart or the upper part.

The upper chart covers the entire calendar year 1935. The space between each of these vertical lines represents a day. This (indicating) would be the whole month of January running across from left to right.

The horizontal lines represent fractions of a cent in price. The lowest line here on the upper part of the chart is 3¢. It runs up in fractions of ⅛¢ on up to the top of the chart, and that is 6½¢. This heavy horizontal line, running across here, is a 4¢ level. This heavy line above is the 5¢ level.

Each one of these dots represents a purchase transaction, but there may be more than one purchase transaction reflected by one dot. If there is more than one, it is noted; there is a number underneath indicating just how many it is.

The dots are plotted on the chart on the day that the purchase transaction was entered into; not the date of shipment, but the date that the purchase was made. They are also plotted on the chart at the price that was fixed at the time the transaction was entered into. In other words, take for instance, one right here on March 20th. There a major company bought third grade gasoline on March 20th, at
3½¢. That dot is on the 3½¢ level, and the dot is also
3113 in the space indicating March 20th.

The dots are of different colors. The top range up there contains dots that are green. That indicates regular grade. The dots on the lower range here are black. They are third grade. So this (indicating) indicates the purchase transactions of third grade gasoline and this (indicating) the purchase transactions of regular grade gasoline, by defendant major companies.

The whole upper part of the chart is limited to purchases by defendant major companies.

The graph running along here indicates the quotations appearing in the two trade publications. The red area indicates the quotations appearing daily in Platt's Oilgram. The hatched area indicates the quotations appearing in the Chicago Journal of Commerce.

Now, as I stated before, the Journal makes only one quotation that is Group 3. That would include material coming out of any refinery district whatever, as long as the f. o. b. point was Group 3. Platt's Oilgram has a large number of quotations. They have them for each important refinery district.

We are plotting here on these charts only the quotations in the Oilgram for the Oklahoma refinery district, that being comparable with Group 3. And the chart indicates that it is comparable, because you will notice that the prices agree generally throughout the year.

3114 The upper chart shows exactly what the major companies paid for regular grade and third grade gasoline on flat price transactions throughout 1935, in their purchases from independent refiners and brokers. And it compares the price they paid with what the two trade publications reported was the market.

It includes purchases made by the defendant major companies from East Texas refiners.

That is not limited to purchases made from any particular refining district. The only limitation as to that is whether the material coming out of the East Texas refinery district was purchased on an f. o. b. Group 3 basis. If it was, those purchases are reflected on that chart.

I am familiar with the charge in paragraph 24 of the indictment that the trade papers, instead of quoting prices paid by jobbers and consumers as they claimed to do, published prices which were being paid by the defendant major companies to independent refiners. This chart clearly shows that the major companies bought at prices under the quotations as appearing in the trade publications; so that if that charge were true these quotations that were in the trade publications would have, of necessity, to be at a lower level. You will notice that running from March, 1935 straight on through, these black dots appear at levels lower than the trade publications reported. If these publications had been using the defendant companies' prices, as shown
3115 on that chart, as charged in the indictment, they
couldn't have published the price that they did publish. They would have had to publish lower prices. So that the prices then used by the publications must have

been prices other than the defendant companies' prices in order for them to have published the prices which they did.

In that connection, I might point out that you will find very few purchases by the majors, running along here from the last half of 1935, of regular grade. If the publications were basing their quotations on the major companies' purchases you wouldn't have any market to speak of at all in the last half of 1935 on regular grade. So you could not report a market for regular grade for the last half of 1935, except on isolated days, as far as the major companies' purchases were concerned. And there are some days in 1935 in which you will find no purchases of third grade by the major companies.

Mr. Chaffetz: Q. May I ask a question. Don't you know that the journals continued to publish prices whether or not we have transactions on any days; whether they find any transactions?

A. I understand that they include quotations as well as actual sales.

Q. And they continue to publish a price for weeks even though they don't discover any transactions?

A. They would have to have quotations, and if 3116 they don't have quotations or sales, I think the publications indicate that those prices may be nominal, in that event.

Q. You don't know what their practice is in that regard?

A. I have seen the publications, and have frequently seen the notation that they are nominal.

The lower chart is so thickly plotted that I would have to check carefully to see whether there would be any day on which a jobber didn't buy. I don't recall any day when there was no transaction. That does not represent all jobber and consumer purchases. This doesn't purport to be all-inclusive of spot sales to jobbers and consumers. It represents only those which we were able to audit.

Mr. Chaffetz: Q. There are a number of days, which, in the case of regular gasoline, there are no transactions indicated on that chart?

A. Yes, there are a few days.

Q. Quite a number, as you look at that chart?

A. I wouldn't say quite a number, relatively.

Mr. Donovan: Q. That is true about the major chart, and that indicates all transactions made by major companies, and that is all it refers to; is that correct?

A. That is correct. And that includes, of course, purchases by the majors from brokers as well as 3117 independent refiners, whereas this, the lower chart, does not include spot sales to jobbers by brokers, and there was a very large number of those.

By Mr. Donovan

I have prepared a schedule summarizing the amounts purchased by the defendant companies from independent refiners and brokers at prices at the low, above the low, and under the low of Platt's Oilgram. That schedule covers the period from January 1, 1935 on down to April 30, 1936. I started at January because I wanted to cover the entire calendar year of 1935, which this chart covers. I have summarized an intermediate period of 3 months, from March 1, 1935 to May 31, 1935, which is the period of the rise in 1935.

I have still another intermediate period from March 1, 1935 to April 30, 1936, which is the period covered by the Government audit. That is as shown in Exhibits 747 to 751, inclusive.

(Schedules submitted and received in evidence as EXHIBITS 1025 and 1026, respectively.)

Exhibit 1026, which is the summary of f. o. b. Group 3 and f. o. b. Oklahoma refinery flat price purchases compared with Platt's Oilgram for the Oklahoma refinery market, gives the amount in percentages bought above the high, at the high, within the range, at the low, and below the low.

3118 The percentage of cars bought above the market high, March 1, 1935 to April 30, 1936, was less than 1%. This percentage is of cars of regular and third grade gasoline bought by defendant majors of independent refiners and brokers.

That was just about the same percentage as during the time the market was rising in 1935.

For the period from March 1 to April 30, 1936 the percentage of cars bought above the low was about 7½%. But for the shorter period, while prices were rising, the percentage was less than 5%.

Q. So that while the market was going up, fewer cars were bought above the low than during the remainder of the period?

A. No, I won't confine myself to a comparison for the remainder of the period. I was taking that for the period, March 1, 1935 to April 30, 1936, which includes the period of the rise.

There was a substantial proportion bought below the low during the period, March 1, 1935 through April 30, 1936. In number of purchase transactions over 37% were bought under the low, and in cars there was almost 28%. There was a considerably greater number bought under the low while the market was rising in 1935 than for the entire 14 month period, including the period of the rise. So while the market was going up, a greater portion of the cars
3119 was bought at a price lower than the market than
over the period as a whole. As far as cars were concerned, there was double the number of cars bought under the low during the period of the rise.

The chart, Exhibit 1025, is a similar schedule based on the Chicago Journal of Commerce quotations. What I have been just telling about there being more purchases below the low during the time of the market rise is true in regard to this schedule. For the 14 month period, about 28½% of the purchase transactions were made under the low, and that covered about 22% of the cars. In the period of the rise, the number of purchase transactions made under the low was over 35% of the total, and they included over 37% of the cars purchased in that period.

In regard to the charge in paragraphs 21 and 23 of the indictment, that the companies made purchases at uniform prices, this chart shows that there was no uniformity. It shows a great deal of variation in price. There are days in 1935 when the majors bought the same grade of material at 3 different prices on the same day. You see dots scattered all over the chart there (indicating). For instance, here is a day in the latter part of March. 3 different prices were paid on that day. Here is another day, a week later than that, which shows 3 different prices paid on the same day.

I have made a computation of the percentage of days where different purchases of third grade were uni-
3120 form and where they were not. In making that com-
putation I took the number of days in 1935 in which there was more than one purchase transaction, and then as to those days I determined on how many of them there were purchases made at different prices. And I found that on 67% of those days on which there was more than one purchase made, the purchases were made at different prices. That is for third grade.

With regular grades, there are not nearly as many purchases, as indicated by the top portion of the upper half. There are not nearly as many days in which there were more than one purchase transaction. But as to those days, we found that on 41% of them there was more than one price paid.

If we were to combine those two computations, regular and third grade, we would find that on 61% of the days the prices were not uniform.

The lower half of this chart, Exhibit 1024, represents prices paid by jobbers and consumers in purchases made from independent refiners on the same basis as the purchases made by the defendant companies which I have been describing.

I have made a comparison between the prices paid by the defendant companies and prices paid by jobbers and consumers as shown on these charts.

There were 235 jobber and consumer purchase transactions below the low. There were 352 purchases of
3121 third grade made by the defendant companies below the low during this same time.

The number of purchases made by jobbers above the high is about 8%, and that compares with the number of purchase transactions by the defendants above the high of a little over 1%.

The jobbers' purchases at the high are about 10%, as against 1½% of the defendant majors' purchases at the high.

The jobber purchases within the range, that is lower than the top high of the two publications and above the bottom low of the two publications, the jobber purchases within the range would be about 7% as against 4% for the defendant majors.

The jobber purchases at the low are about 59% as against 52% for the defendant majors.

And the jobber purchases below the low are less than 16% as compared with 41% for the defendant majors.

The information I have given with respect to the defendant major companies represents all purchases during 1935 by major companies on a flat price basis, f. o. b. Group 3 or f. o. b. Oklahoma refinery, from independent refiners and brokers. But it does not necessarily represent all such purchases at or above the high made by jobbers and consumers during that time. That would be limited to the independent refiners which we audited.

The jobber purchases of regular grade made
3122 above the high amounted to about 9% of the total purchases of that type as against none for the defendant majors. That is, the defendant majors made no purchases of regular grade above the high.

The jobber purchases at the high, and I am speaking again of the composite high of the trade publications, is about 30% as against about 2½% by the defendant major companies.

The jobber purchases within the range, that is, below the high of the two publications and above the low of the two publications, were about 29% as against 7½% for the defendant major companies.

The jobber purchases at the low were about 25% as compared with 75% for the defendant major companies..

The jobber purchases below the low were about 7% as compared with over 15% for the defendant major companies.

Directing attention to a more specific comparison on some of the prices paid by major companies for third grade in the spot market with prices paid by jobbers and consumers in that market at the same time, on March 1st there is a purchase by a major company of third grade at 3¼¢. That is indicated by this dot right here (indicating) within the vertical lines of March 1st, and on the horizontal line here is 3¼¢. This is third grade gasoline. On that same date the bottom part of the chart shows that jobbers paid as high as 3½¢. And there were 2 purchases by jobbers at 3⅜¢. 3123 There is another purchase (indicating) by a jobber at 3¼¢. And there is a purchase by a consumer at 3⅛¢.

I don't believe that I pointed out that the purchases by consumers are indicated on this lower half of the chart by blue dots. I talked of green dots and black dots, but the blue dots are purchases by consumers. The black dots represent purchases by jobbers. In order to reduce the number of colors we are using here, we have a solid blue dot for regular grade purchases by consumers. And to indicate third grade we have a little white area within the blue dot, indicating a third grade purchase by a consumer.

I was just talking about this consumer purchase on March 1st. That is on this line here (indicating) the horizontal line, 3⅛¢. And you notice a little white space in that blue dot. That indicates a consumer purchase of third grade gasoline.

Prior to March 1st, for a period of about a month when the publications' quotations were on a more or less constant level, jobbers had been paying as high as 3¾¢. In fact, there are some here early in February as high as 4¢. And they range on down to as low as 3⅛¢. There is one here as low as 3¢. So when major companies paid 3¼¢ for third grade gasoline on March 1st they paid no more than the prices which jobbers had been paying for third-grade gasoline for a month before.

On March 5th, an independent refiner sold to a
3124 major at 3⅜¢. That is indicated by this dot here (indicating on chart). On that day jobbers paid 4 different prices to these particular independent refiners that we audited. The highest price paid was 3⅝¢. There were other purchases from jobbers at 3½¢; there were 6 purchases by jobbers at 3⅜¢; and there were 3 purchases by jobbers at 3¼¢.

A comparison of that price of 3⅜¢ that major companies paid for gasoline on March 5th with the prices at which independent refiners had been selling gasoline to jobbers and consumers prior to March 5th, shows that the independent refiners had been selling higher than that level for about a month.

On March 9th, there was a purchase by a defendant at 3¾¢. That is the highest price paid by any major company up to that time for third grade. On that day again we find 4 different prices paid by jobbers to those independent refiners. 1 sale was made as high as 4¼¢, on that same day, March 9th.

Before March 9th independent refiners had been selling to jobbers at that same price of 3¾¢. On March 7th there were sales to jobbers at 3¾¢. That is, for 2 days the independents had been selling at the price to jobbers at which they subsequently sold 2 days later to majors.

On March 13th, when the defendant companies bought at 3⅞¢, there was a sale to a jobber at 3⅞¢.

3125 Prior to March 13th jobbers had been paying independent refiners that same price. On March 12th and March 11th there were 3 sales to jobbers at that price.

On March 21st an independent refiner sold to a major company at a price of 4⅛¢. There were sales made to jobbers on that day at that price.

And independent refiners had sold to a jobber at that same price before that day. 3 days before, on March 18th, there was a sale to a jobber at that same price, 4⅛¢.

I think there were just 2 days in the entire calendar year 1935 when a major company paid a price for third grade gasoline to an independent refiner, when it was not also true that jobbers had already been paying either the same or a higher price. One of them was March 26th, when a major company paid 4⅜¢, and the other day was April 12th, when a major company paid 4⅝¢.

Now, of course, I would not be able to answer whether the major companies on any day throughout 1935 bought at higher prices than jobbers bought from independent refiners if you are taking into account all independent refiners and all sales to jobbers. I can only answer the question as to these particular independent refiners that I audited; and there are 2 days where the majors did pay higher prices than those particular independent refiners sold to jobbers.

Limiting my answer in that way, with the exception of
those two, it is correct to say that whatever the prices
3126 were which the major companies paid, the prices
which independent refiners were getting from jobbers
and consumers in the spot market had already gone up. The prices paid by jobbers advanced first.

As to those 2 days where the prices some major companies paid were in advance of the prices jobbers or consumers were paying, neither of the trade papers published those prices which the major companies paid on either of those days. Those prices are higher than what the publications reflected. In the instance of March 26th, it was 4 days before the Chicago Journal of Commerce reflected a price as high as what that major company had paid, and it was 11 days before Platt's Oilgram did.

Before the trade papers reflected a price equivalent to that price the major companies had paid, there were purchases by jobbers at that increased price. There was a purchase by a jobber 2 days before the Journal reflected that level. And in the case of the Oilgram of course there were jobber sales for quite a time before it reflected a price level that high.

Although on 2 days in 1935 my chart would indicate that major companies paid a price higher than the published market, and higher than what jobbers were paying in the spot market, the trade papers did not reflect that higher price that was paid by major companies. They only reflected that higher price after there had been some
3127 jobber buying at that higher price.

Q. Is what you have just been saying about third grade true also about the regular grade?

A. There are considerably fewer transactions in the regular grade, and they are scattered over a wider range.

Government Exhibit 120-A, a letter written by one of the defendants in this case who was connected with Skelly Oil Company, has been called to my attention. On the basis of the government's own audit, no prices paid by the Skelly Company in March, April and May, 1935, were above the market. I refer to Government Exhibits 747 to 751, inclusive. Skelly did not buy a single car at a price above the market as shown in either trade paper. During March, April and May, 1935, Skelly did make purchases at or below the low of the market, but no cars were bought above the market by Skelly during that period.

The Government audit shows that during the whole period between March 1, 1935 and April 30, 1936, Skelly out of its total purchases of 643 cars bought no more than 30 cars above the low of the Oilgram, and only 32 above the low of the Journal.

I have examined the prices mentioned in Exhibits 105 through to 118, as having been paid by Skelly, to see whether those prices were ordinarily above the market. I think Exhibit 118 refers to a purchase made on 3128 March 8, 1935 of regular grade gasoline. That related to a purchase of 6 cars at a price of 4⅝¢. The price paid on that day was the low of the Oilgram.

Skelly made 8 purchases of regular grade, and 4 purchases of third grade between March 1 and May 1, 1935. Of course I am limiting my answer to flat price purchases, and on an f. o. b. Group 3 basis, or Oklahoma refinery basis.

There were 6 purchases above the market, all for local shipment; but there were no purchases above the market during this 3 months period when the price was rising; or, if you limit it to the period, March 1, 1935 to May 7, 1935, there were none.

All Skelly purchases of third grade were below the low of both publications. The purchases of regular grade were at the low of both publications, or at the low of one publication and above the low of the other, with the exception of just 1 purchase for 2 cars, which was on April 18th. That was a purchase of 2 cars that was ⅛¢ above the low of both trade publications.

There were no purchases of regular grade above the market by the defendant companies. There are, however, 10 purchases of third grade above the market. After March 1st and for the remainder of the year 1935, there are 6 purchases by defendant companies at a price above the market. There might be some within the range, or at the high of the market, but that is all there are above 3129 the market. The vast majority of them were at the low or lower. And I have already testified that in 1935, when this Skelly Company letter was written, there was not a single purchase of regular gasoline by that company on an f. o. b. Group 3 basis at a price above the market.

Out of these hundreds of purchases of third grade gasoline during that period, there were only 6 purchases above the market, and all of these were for local shipment. I would like to correct that answer that I made a little while ago, about the 6 above the market. That might have been taken to mean Skelly. Those were not Skelly purchases; I mean, these 6 major purchases above the market. The Skelly Company did not buy any above the market during the entire year 1935.

I have looked into the question of whether jobbers and consumers made more purchases of gasoline in March, April and May, 1935, when prices were rising, than they did during January and February of that year. I can give the figures for each month.

In January, 1935 there were 137 sales of regular and third grade gasoline to jobbers and consumers by these particular independent refiners which we audited. In February, 151; in March, 171; in April, 214; and in May, 204. These figures indicate that the sales to jobbers increased considerably during this period of the rise, as compared with January and February. So, during 3130 the time the market was going up, the number of spot market purchases by jobbers and consumers was substantially greater than in the preceding months. There was an increase of about 75% over January and February.

I made an audit of the sales to brokers by all of the independent refiners I have previously mentioned. I made an examination to determine the quantities of gasoline purchased by brokers from these independent refiners in each of the months between November 1, 1934 and the end of July, 1936. That is a period of 21 months.

To determine who was the broker, we inquired of the sales department of each one of the independent refiners. We checked the information we received from them to the Petroleum Register. We cross-checked every one of our audits. We examined into the destination of the shipments, because they also would give you an indication whether the customer was a jobber or a broker. By that I mean that on a sale to a jobber you will usually find the shipment is destined or is routed to the jobber's address. But in a shipment to a broker, it may go anywhere, because it is routed to the broker's customer. There might be some exceptions to that, where the broker would make a purchase on speculation, not having a

buyer for the car at the time he makes the purchase, and he finds a buyer after the car starts rolling. In that event, the car would be re-routed while it was rolling,
so that the destination of the shipment as shown on
3131 the invoice would not necessarily be the ultimate des-
tination. However, that is an unusual circumstance. I haven't compiled a list of so-called brokers.

The total gasoline sold by these independent refiners to brokers during this period of 21 months is 119,097,944 gallons.

The 3 months period of March, April and May 1935 was the most active period in sales by these independent refiners to brokers, as compared with the amount of gasoline bought by brokers during the rest of this 21 month period.

April, 1935, for instance, shows the largest amount of sales of any month in the 21 months; March, 1935, is second; May is fourth, ranking just below July, 1935, which is third in point of volume, and the difference there is just about 4 or 5 cars.

In March, the sales to brokers aggregated 8,280,983 gallons; in April, 8,565,645 gallons; in May, 7,364,404 gallons.

During this period of 3 months, the brokers bought more gasoline from these independent refiners than at any other time during that entire period of 21 months.

These independent refiners from whom brokers were buying these large quantities of gasoline included all of the Mid-Continent independent refiners named in the indictment.

I am acquainted with the testimony in this case of
Mr. Steiger, of the Oilgram, with respect to whether
3132 or not the trade papers reflected broker prices. It
was that they reflect the spot purchases by jobbers, irrespective of who the seller is. That is, the seller can be a refiner or it can be a broker. But they do not reflect the prices in sales to brokers, but just in sales to jobbers.

We made an investigation to ascertain at what prices brokers were selling to jobbers during this 3 months period when brokers were as active as I have just described. As I said before, we audited Tansel Petroleum Corporation, which was a broker, during the 3 months period when prices were rising in the spring of 1935. In connection with our audit of Danciger and Bell, which conduct a brokerage business as well as a refinery business, we noted their sales as brokers. And when we were tabulating this volume, we made test checks of the prices they were getting, and we found that in more than two-thirds of the cases they were selling at the low or higher.

I have made an analysis to determine the proportion of gasoline purchased by the defendant companies from certain of these independent refiners, as compared with the total sales made by such independent refiners. The lowest percentage of the total sales made by any one of those Mid-Continent independent refiners named as alleged co-conspirators in the indictment which was made to the defendant major companies, was less than 4%, about 3.72%. Rock Island Refining Company sold only 3.7%
3133 of its gasoline to the defendant major companies.
That company sold a relatively large percentage of its gasoline to jobbers.

The highest percentage of the total gasoline sold by any of these Mid-Continent independent refiners alleged as co-conspirators in the indictment was sold to the defendant companies by Taxman Refining Company. It sold almost 47% of its total output to the defendant majors. During 1935 Taxman Company had very few jobber customers.

Champlin Refining Company sold about 4½% to the defendant majors; Danciger sold less than 5%; Bell Oil & Gas sold about 9½%, that is, less than 10%; Cushing sold about 11% to the defendant majors. These companies sold the greater part of their production to jobbers during that period.

Shamrock sold about 44% to the defendant majors; and Olney Oil & Refining Company sold about 41%. We have made an inquiry or survey or investigation as to the amount of jobber business which those companies did during 1935. We made an audit of these two independent refiners. As I said before, we made an audit of every one of the refiners named in the indictment as operating in the Mid-Continent field, and named as co-conspirators. And we found that neither of those refiners had many jobbers; in fact, they had very few, and practically all of them were local concerns.

3134 These companies that I have just talked of, Danciger, Rock Island, Champlin, Cushing and Bell, as selling extensively to jobbers in 1935, sold to a great extent on the spot market to jobbers during that period. Those independent Mid-Continent refiners who sold the most gasoline in the spot market to jobbers in 1935 were the refiners from which the defendant majors, relatively speaking, bought the least gasoline. I can tell that in terms of percentage.

The 5 independent refiners that I named, which sell very extensively to jobbers and very extensively in the spot market, sold less than 7% to these defendant majors.

Also, the Mid-Continent independent refiners from which the defendant major companies purchased, relatively speaking, the largest quantity of gasoline, were those companies which, from our audits, had the least jobbing outlets for their gasoline. They were those 3 refineries, and they had practically no jobbing outlets.

Cross-Examination by Mr. Chaffetz.

We did not make any determination of the percentage of the total spot market business of these independent refiners that was done with major companies during the period in question. I do not know what the figure would be. We intended to undertake that, but we found that was a gigantic task, and we wanted to finish these other studies all through 1936, if we could.

3135 Q. The only figures you had were percentages of their total business, including contract business, including retail business, including business with their own bulk plants, including local trucking business—including all the business that the independent refiner does?

A. Total sales of every type and description, yes.

Q. Now, you gave us some testimony about the way in which you prepared that large audit. And I think you said you had the materials available for examination by the Government agents. How long do you think it would take for Government accountants to check your audit, if they started today?

A. That would depend to a great extent on how much preliminary work you already have completed. You have made an audit. With that work I would have to know first how extensive and in what shape that is set up, before I would know how much longer it would take to check our audit.

Q. What would you think would be a minimum time, making all the assumptions in favor of getting through at the shortest possible time?

A. That I couldn't estimate, Mr. Chaffetz, unless I saw your working papers.

Q. It would take a long time, wouldn't it?

3136 A. No, not necessarily. You might have it set up so that you could audit them in very short order.

Q. A lot of that material which the Government hasn't had access to at all?

A. I don't know what you have had access to. You have been on the job for a couple of years.

Q. Now, will you tell me, looking at Exhibit 1025, what percentage of purchases by major companies—by defendant major companies that you name were from independent refiners?

A. First of all, Mr. Chaffetz, so that I can follow you, my copy does not have the exhibit number. Are you referring to the Oilgram or Journal of Commerce?

Q. I want to know what percentage of all the purchases made from March 1, 1935 to April 30, 1936, what percentage of the total were made at or above the low of the Journal quotations?

A. You want that in purchase transactions or cars?

Q. In tank cars.

A. That would be about 78%. At or above; is that the question?

Q. Yes, that is right. Now, you referred to the fact that during the price rise, I am not referring to that exhibit any more, during the period of the price rise, March, April and May, the activities of the brokers were more concentrated than during any other period during the year 1935; is that right? You said the brokers were more active. 3137

A. They were much more active. I don't know what you mean by concentrated.

Q. More transactions.

A. Yes.

Q. Do you know why?

A. I have a very good idea.

Q. Was it because the price was going up?

A. They anticipated a price rise.

Q. They anticipated a price rise, that is right. When they understand that the price is going up they can buy even at the market and hope to resell at higher than the market the following day, and make a profit; isn't that right?

A. You are assuming, Mr. Chaffetz, that brokers operate by being speculative, that is they buy before they have a customer. Mr. Beroth testified here that he never did that, he always had a customer.

Q. Does that answer my question?

A. I think it does, yes.

Mr. Chaffetz: Will the reporter read the question.

(The question was then read by the reporter.)

3138 A. Your question about whether they do or not is a different question.

Q. You don't know?

A. I know that Mr. Beroth said he didn't.

Q. All right. You referred to the Skelly letter, Exhibit 120-A, and Colonel Donovan read you one sentence from that letter as follows: "Now, by including Rohrer's requirements of Aromax on our arrangement with Sunray, we could have about ten cars a month to buy from those people. This is about what we would have ordinarily to take from them on the buying program at a price which would ordinarily be above the market."

That is the sentence Colonel Donovan read?

A. Yes.

Q. You answered him in a series of questions that they didn't buy any; was that correct?

A. That is right.

Q. Listen to the following sentence:

> "If we were to take that much from them each month, independent of the buying program, there wouldn't be anything to take from them on the program, so what would be sweeter than discharging that buying obligation by arranging to take about ten cars a month from Ada, Wewoka, and McAlester at a price under the market? I have gone ahead on the assumption that that would be the thing to do, 3139 and I have arranged with the Sunray people to buy that much, on an open agreement, each month, at 1/8¢ under the low in the Journal for the middle octane grade on date of shipment, shipment to be made in their cars."

I ask you whether that letter doesn't say if we bought it on the program we would pay a higher price; but if we were not to buy it on the program, then we would not be obliged to pay the higher price; we would get it at 1/8¢ below the Journal of Commerce, and didn't that letter say that is exactly what he was told to do; and isn't that why none of those purchases were made at the high price that Colonel Donovan asked you about?

A. No, I wouldn't agree with that.
Mr. Chaffetz: I will let the jury decide.

Redirect Examination by Mr. Cunningham.

If I rely on my recollection, I think that the sale of gasoline by Kanotex in one of the years was a purchase by Phillips of 1 car. I don't remember when that was. I haven't the date.

It is my recollection that that was the only sale by Kanotex to any major company that I found. The way that came up, I criticized the treatment of that by the Government audit, because it was bought f. o. b. refinery, and
3140 the refinery is located in Kansas; and they had compared the purchase price with f. o. b. Group 3 or f. o. b. Oklahoma refinery. That was all that my testimony had to do with the car from Kanotex. I know that the refinery in Kansas has a differential on freight rates to the East, over the Oklahoma freight rate. I think it is a ¼¢.

Mr. Chaffetz. Q. As a matter of fact, Kanotex is not named in the indictment as one of the companies that sold in the buying program?
A. No, it is not.
Mr. Donovan: Q. Referring to the Skelly letter for a minute. As I understood your testimony, you said that none was bought before the letter was written, as well as after; isn't that right?
A. Yes.
Mr. Chaffetz: Q. And the letter doesn't say the contrary, does it?
A. No.

Direct Examination (Resumed) by Mr. Foster.

I have made a compilation of the number of tank car purchases of gasoline by Phillips Petroleum Company from independent refiners in the Mid-Continent field during the months of January and February, 1935.

Those figures were compiled from the impounded records. And as to Phillips, to get the purchase orders we went
3141 into the independent refiners who sold to Phillips. Some of those records were also impounded here. And I think, in a few instances, we had to go into the offices of those independent refiners to get the purchase orders.

The total number of cars purchased in January, 1935 was 91. The total for February, 1935 was 172 cars. The average for those two months would be 131 cars.

The total purchases of Phillips in January, 1936 were 92 cars, and in February, 1936 were 98 cars. The average for those 2 months would be 95 cars.

The average number of cars purchased by Phillips during the period March 1, 1935 through April, 1936, was 114 cars.

Phillips purchased from 33 different independent refiners during the period March 1, 1935 through April, 1936.

The average of Phillips' purchases in the months of January and February, 1935 exceeded the number purchased in January and February, 1936. The purchases in the first two months of 1935 averaged about 35 cars a month over the same two months of 1936. The average purchases in those two months exceeded the average number of cars purchased during the entire period, March 1, 1935 through April, 1936.

Cross-Examination by Mr. Chaffetz.

I was comparing purchases made by Phillips after March 1, 1935 with purchases made in January and February preceding.

3142 The letter of January 12, 1935, Mr. Buckley to Mr. Brandli, Exhibit 11, is incorrect as to purchases made by Phillips. Phillips didn't purchase the quantity stated in the letter. It did make some purchases. I wouldn't know whether those purchases were uplift purchases or not.

Redirect Examination by Mr. Francis.

It is my recollection that The Pure Oil Company made no purchases from independent refiners, in the Mid-Continent area, until March 21, 1935, January, February, and March, 3 months after this letter, Exhibit 11, was written.

By Mr. Donovan

I made an examination of the letters in which there was reference to the Skelly purchases on a buying program, and which specifically characterized these purchases as being made on the buying program. My examination showed that on these buying program purchases the Skelly Company did not pay a price above the market.

By Mr. Wood

I mentioned the percentage of total sales by Taxman which were made to major companies as being about 40% in 1935.

Q. In 1935. Can you tell from the papers that you have before you whether in 1935 Taxman sold any gasoline at all to Sinclair Refining Company?

A. I think I could tell that from the papers that

3143 Mr. Seitz has back there in the court room.

Mr. Chaffetz: Mr. Wood, if you know the fact, and there is no dispute—

The Court: What is the fact?

Mr. Wood: Our record shows that they did not.

Mr. Chaffetz: ~~Well~~, subject to check, it may be understood that ~~they~~ did not.

The Court: Let the record so show.

Mr. Cunningham: And may the record also show that that sale from Kanotex was in June, 1935—?

Mr. Chaffetz: If you say that is so, it may so show.

The Court: Let the record show that.

By Mr. Donovan

I have the percentage of purchases at and below the low. About 86% of the cars purchased in the 14 months period from March 1, 1935 to April 30, 1936, by the defendant majors, was bought at or below the low quotations of the Chicago Journal of Commerce. That is a larger percentage than was bought at and above.

The same comparison with the low of Platt's Oilgram for the Oklahoma Refinery market is over 92%, as compared with the percentage at and above.

(Witness excused.)

(Document marked Exhibit 1030 for identification.)

Mr. Donovan: Your Honor, I have here Exhibit

3144 1030, being a certified copy, by Mr. Ickes, of a report of the Chairman of the P. A. B. Board, made to Mr. Ickes on March 23, 1935.

Mr. Chaffetz: About the Blazer report?

Mr. Donovan: That deals with the report of the Blazer Committee, to which your Honor has already sustained an objection, the Blazer Committee report; but it shows what action was taken by the P. A. B. Board on this.

I would like to offer this report of Mr. Fahy, and I want to state it accurately, if I may, your Honor—addressed to the Administrator, dated of that day; and in the event, after your Honor examines it, you would feel that you would want to sustain any objection to it as a whole, I would like to offer separately the last two paragraphs on page 5, and also page 6.

This portion deals with the activities of the P. A. B. in connection with those matters now being considered here; and this portion of the report, I believe, your Honor, is clearly within the subject matter which your Honor has already admitted, and permitted certain evidence to come in.

The Court: I will take it under consideration and we will pass on it later.

Mr. Donovan: And then I have only this report
3145 to read, that your Honor permitted me to introduce.

The Court: Read that into the record now.

(Col. Donovan read the part of the Annual Report of the Secretary of the Interior, for fiscal year ending June 30, 1935, which was admitted into evidence as EXHIBIT 917-A, to the jury.)

Mr. Donovan: Your Honor, may I take exception generally and separately as to each part of the report that we were not permitted to read?

The Court: Yes. Exception allowed.

Mr. Donovan: Here we have some Exhibits which the record does not show were admitted, but I think there will be no question about them. Suppose we take that up with Mr. Hale, and have it checked after lunch?

Mr. Donovan: The stipulation, Exhibit 991.

The Court: All those stipulations are in, aren't they?

Mr. Donovan: Yes, we thought they were, your Honor—

The Court: Well, that is received. Go ahead.

(Stipulation and charts previously so marked for identification are received in evidence as EXHIBITS 991, 1013, 1019, 1020, 1021, 1022 and 1024, respectively.)

Mr. Dorr: Previously we offered certain Exhibits with reference to the Pennsylvania situation, or we re-offered them. Those Exhibits were handed to
3146 the stenographer, but they are not noted in the record as to what Exhibits they were.

They were Exhibits 916 for identification, 925 for identification, 915 for identification, 972 for identification, 973 for identification, and 971 for identification.

The Court: Now, as to those Exhibits, the objection of the Government was sustained. Exception allowed.

Mr. Dorr: In connection with the Final Report of the Marketing Division of the P. A. B., Exhibit 914 for identification, I don't know that the record shows exactly what part of this we offered.

I would like to have the record show it. In the first place the Imprimature and the general statement that it is a report of the United States Department of the Interior, Harold L. Ickes, Secretary, Petroleum Administrative Board, George W. Holland, Chairman, and that it is prepared under the supervision of John W. Frey, and issued June, 1936, by the Department of the Interior.

I would like to have in the text the pages 120 to 122, that have to do with stabilization, and if that be not received, the particular paragraph on page 124 which I think your Honor's attention was particularly called to, beginning with the words, (Reading)
3147 "As the various problems—" that I think your Honor has got fully in mind; if you haven't, I will show it to you (handing document to the Court). That is the particular paragraph.

Now, as to that, on the ground of the offer, in looking over the record, these particular grounds I don't know were specified. I think perhaps they were covered in the argument, and I would like to call them to your Honor's attention so the record will show.

Mr. Chaffetz: May counsel just read them into the record?

Mr. Dorr: Yes. In the absence of the jury?

Then, there were certain Exhibits offered with reference to buying programs, and there was one Exhibit I have that doesn't seem to have—and that is the Exhibit covering the so-called California agency agreement. I don't think that was marked for identification.

The Clerk: 1029.

(Document referred to is marked Exhibit 1029 for identification.)

Mr. Dorr: In connection with the offer of Exhibit 710 for identification, which was the Code, there were two paragraphs which I should like to call to your Honor's attention. Do you want me to note those in the record?

The Court: Yes.

Mr. Dorr: Well, I should like to ask the Court
3148 to take judicial notice of the National Recovery Act. It has been mentioned again and again in the testimony, and it seems to me that certain portions we should be free to call to the attention of the jury, and without having that in evidence, it is unfortunate—for instance, the July 20th letter—

Mr. Chaffetz: National Recovery Act?

Mr. Dorr: Yes.

Mr. Chaffetz: No objection to judicial notice of any statute in the United States.

Mr. Dorr: The Code was at that time.

Mr. Chaffetz: You mean to tell me you want the Court to take judicial notice of the Act and you meant to include the Code?

Mr. Dorr: We do feel that the Code should be admitted in evidence, and the Court should take judicial notice of it, because there, again, there has been frequent reference made to that Code and to the testimony—

That is one reason why it should be in, because there have been these references, and after all, the provisions of the Code is the best evidence rather than what some one said about it.

And we want the Court to take judicial notice of the Code. We have already asked the Court to admit the Code or take judicial notice of it, and without it,
3149 it would be extremely difficult in arguing the case to the jury not to be able to refer to the proper provisions of the Code.

Then, shall I read these other matters to the stenographer in the absence of the jury?

The Court: Just excuse me a moment. I have examined this Exhibit 1030, and the objection of the Government to that Exhibit is sustained. Exception allowed.

(In absence of jury:)

Mr. Dorr: Exhibit 1029 was included—the California agency agreement—was intended to be included among the offers of the buying program which were considered by the Court in the argument beginning at page 1055.

The additional grounds for defendants desiring to call it to the Court's attention in connection with Exhibit 914 for identification are:

First: That these portions of the report which has been offered in evidence constitute an admission by the Government through the Department of the Interior that the buying activities in the spring of 1935, which are the subject matter of this indictment, were being caried on de facto under a stabilization sub-committee, set up in the course of the activities of the General Stabilization Committee, initiated 3150 by the letter of the Secretary of the Interior, July 20, 1934.

Two: such portions of the report constitute an admission by the Government, through the Department of the Interior, which corroborates the testimony of Mr. Arnott that no request or direction that this committee be dissolved, or its activities discontinued, was given by the Secretary of the Interior or the Petroleum Administrative Board.

Three: that these portions of the report so offered in evidence constitute an admission by the Government, through the Department of the Interior, bearing on the administrative construction of the letter of July 20, 1934, of the Secretary of the Interior, has been offered in evidence by the Government.

Four: that these sections of the report offered in evidence constitute an admission by the Government, through the Department of the Interior, bearing on the state of mind of the defendants engaging in stabilization activities in connection with buying distress gasoline and their good faith in undertaking these activities through a committee in the course of stabilization, initiated as a result of a letter of July 20, 1934.

Mr. Chaffetz: Objection.

The Court: Objection sustained; exception allowed.

3151 (Document marked Exhibit 1031 for identification.)

Mr. Chaffetz: If the Court please; I have here a document that was sent by one of the defendants in this case, A. G. Maguire, to certain other persons, dated July 24, 1934, and it relates to the letter of Secretary Ickes to Mr. Arnott of July 20, 1934, with the forwarding letter with which M. G. Peeters, Vice President of Wadhams Oil Company, sent that letter to the foreman of the grand jury at the latter's request.

I understand there is no question as to the authenticity of these documents.

(Document referred to is received in evidence as EXHIBIT 1031.)

Mr. Chaffetz: This letter is on the letterhead of the Planning and Coordination Committee for the Petroleum Industry, Regional District No. 3, Room 514—910 South Michigan Avenue, Chicago, Illinois.

May it be understood that Region 3 comprised the Standard of Indiana territory? Is that a fact?

Mr. Donovan: It does not include Kansas.

Mr. Donovan: It included Ohio.

Mr. Kirkland: And Kentucky.

3152 Mr. Francis: Region 3, you better state what that is so it will appear in the record. Region 3 refers to what?

Mr. Chaffetz: My understanding is Region 3 refers to the entire Standard of Indiana territory except Kansas, and also includes Kentucky and Ohio.

(Mr. Chaffetz read Exhibit 1031 to the jury.)

3153 CHARLES E. ARNOTT, one of the defendants herein, called as a witness for the defendants, testified as follows:

Direct Examination by Mr. Donovan.

My address is 26 Broadway, New York City. I was born in Chicago, Illinois. I went to ordinary grammar school and high school in New York, finishing in 1895. Then I got a job with Standard Oil Company of New Jersey, at 26 Broadway, New York City, as a clerk. I stayed with that company until 1905. During that time I was working in the sales department of the lubricating oil division. Eventually, I went to Newark, New Jersey, where I was in charge of the salesmen of the lubricating sales department. I was eventually called back to New York, and was in charge of the sales of lubricants in the New York, Pennsylvania and New Jersey division. In 1905 I had a chance to go with Vacuum Oil Company, a subsidiary of Standard Oil Company of New Jersey. Its business had specialized in the manufacture and sale of lubricants.

Vacuum Oil Company was one of the very old companies. It began about 1865; started in the manufacture and sale of harness products; branched into the making and sale of lubricants. In those days, and up to the time that I went into the oil business, lubricants were made almost entirely of animal, vegetable, and fish oils. 3154 Vacuum Oil Company was one of the first to go into the production and sale of lubricants made from petroleum. It specialized and thereafter built up a large business in petroleum lubricants.

When I started in the oil business the primary product was kerosene, used for lighting, heating and cooking. There was a general demand for it for those purposes pretty well over the world. Gasoline, which was then largely known as naphtha, was considered a by-product and more or less of a nuisance. It had very little demand except for cleaning and some commercial purposes. Other by-products were lubricants for machinery, and some specialties, so-called, in the form of wax that went into candles, axle greases, residuals that were used for asphalt and for pavement, and things of that general character.

When I was engaged in the sales end of lubricants of Standard Oil Company of New Jersey, Vacuum Oil Company was the outstanding manufacturer of lubricants for machinery, and Standard Oil Company of New Jersey was a buyer and distributor of the products. When I got a chance to go to work for Vacuum Oil Company its lubricants and specialties were in wide use in domestic fields and in most of the foreign countries.

I worked in the marketing or merchandising division. I handled business in most of the foreign countries 3155 from the New York office. I traveled extensively for a great many years all through Europe, Africa, South America and the Near East. I gradually worked my way up in the marketing end of this company. I became a director of the company in 1910, as I recall it.

In 1911 there was a change in the status of Vacuum Oil Company. Vacuum Oil Company then was cut off from Standard Oil Company of New Jersey and began its work on its own. This change brought me in closer contact with the Mid-Continent area. Vacuum Oil Company had sold its products and distributed them in that area through Standard Oil Company of Indiana. At that time the Indiana company ceased to be interested in the handling and sale of Vacuum products, and discontinued them. That necessitated Vacuum Oil Company, in order to maintain its position; organizing and going on its own into this territory. At that time the introduction of the automobile had revolutionized the petroleum business.

I continued with Vacuum Oil Company right up to 1931.

During that period there was a distinct change in the way in which the petroleum business in the United States was conducted which affected Vacuum Oil Company and my own activities. In 1911 there was a very great growth
3156 in the operations of integrated companies. They
were interested in the production and transportation of crude, and in the marketing of a complete line of petroleum products. Gasoline had become the outstanding product. There was of course a large and now a fast-growing market for lubricants. The kerosene, fuel oil and specialty business continued and this new development brought a demand for all manner of products.

There was a marked change in the way in which these products reached the consumer. Up to 1911 the prevailing way of distributing products was through the garage, the small dealer and the curb-side pump operator. By 1925 and 1926 that had materially changed. While there was still some garage and jobber business, the service station had become the desirable outlet, and the integrated companies made every effort to secure distribution through these stations by the appointment of jobbers, so that they could sell not only their own brands of gasoline, but also their own brands of lubricating oils.

This change seriously affected Vacuum Oil Company. It had depended on distribution through the garage and the small dealer. One very noticeable change was that service stations, particularly independent stations, were more interested in the sale of known brands of
3157 gasoline, and in consequence tended to handle the
lubricants of the manufacturers of those brands of gasoline. The refiners themselves went into direct distribution through their own stations, and of course controlled the brands of gasoline and motor oil that they sold. Vacuum Oil Company, therefore, was faced with losing its distribution, and had to consider how to get retail outlets for its products. The situation was serious.

We decided that there had to be consideration given to finding some method of distribution that would protect the business we had established at great cost. We considered a number of independent refiners and marketers who had distribution, and eventually they joined their business with ours and became stockholders in our company, their own managements continuing in charge. Those concerns were Lubrite Refining Company, St. Louis; Wadhams Oil Company of Milwaukee; White Star Refining Company of Detroit, and some smaller ones. I participated in negotiations that brought them into our organization. As a result, Vacuum Oil Company gained distribution in the Mid-Continent area, and was enabled to carry on its business in a more effective way.

I became a vice-president and eventually president of the company.

These developments I have referred to were in the 3158 Mid-Continent field. Vacuum Oil Company, which operated in all parts of the United States, had still the problem of the protection of its business in other sections of the country, and it eventually merged with Standard Oil Company of New York, which had large distribution of established brands of gasoline with outlets for lubricants in many markets of the United States, notably in the East, in Texas and on the Pacific coast, as well as through the White Eagle Division, which had headquarters in Kansas City and covered many cities in the Mid-West. After that merger the business was conducted under the name of Socony-Vaçuum Oil Company. I became an officer of that corporation; and in 1932 I became president.

In 1933 I was familiar with the passage of the National Industrial Recovery Act. I was familiar with the preparation of the Code for the petroleum industry, under that Act. In May, probably 30 days before the eventual passing of the N. I. R. A., the administration mentioned the preparation of what eventually became the N. R. A. Code as important to meet the emergency. The administration pointed out that industries were in a serious and critical condition. It urged upon industry that it regulate itself and enter into fair practice rules and operations in 3159 partnership with the government. It pointed out that a great deal of disturbance had been brought about by the so-called chiseler, who had engaged in destructive practices, treated labor in an unfortunate manner and had contributed a great deal to the distress. The petroleum industry was urged to consider the employment of labor, the shortening of hours, the raising of wages, and to do what it could to bring about fair practice operations by means of a code. It accepted, and prepared a code for submission to the administration.

My first personal participation in the preparation of the Code, as I recall it, was sometime in June, 1933. I was appointed chairman of a committee by the board of directors of the American Petroleum Institute to work with all elements of the industry throughout the country in the preparation of a marketing division of the Code.

As chairman, I called a meeting in New York City that was quite representative, I felt, of the elements of marketing in the industry, and prepared and suggested rules for consideration of the Institute, to be submitted to the Government. I took up the matter with various associations of marketers in the industry.

Immediately thereafter, with the feeling that this Code for marketing should have a more general consideration by other elements in the industry, I called a meeting in Chicago. 3160 That meeting was attended by some 58 or 60 individual dealer and jobber organizations that came from the different states in the country, and I submitted the rules of the Code for their approval.

The next step in the formulation of the Code was the call of a general industry meeting in Washington, to consider the Code not only in regard to marketing but also in respect to production and refining. From that time until the approval of the Code, I was very active in the matter.

The Code was approved by the President August 19, to become effective, as I recall it, September 2, 1933. After the Code was approved, I was appointed as a member of the Planning and Coordination Committee.

Exhibit 967 for identification is the letter of appointment that I received.

> (Letter referred to received in evidence as EXHIBIT 967 and read to the jury by Mr. Donovan.)

I was very active in the performance of my duties under that appointment through the life of the Code until May 27, 1935. In 1933 I was appointed chairman of the Planning and Coordination Marketing Committee which had to do with bringing about proper functioning under the Code that had been approved. The Code organization was very extensive. As chairman of the marketing committee 3161 I had frequent occasion to deal with it.

The organization operated through districts, and in each district there was a chairman that represented the district planning and coordination marketing committee. The members of that committee in turn would be chairmen of state, local, or temporary committees, scattered throughout the entire country. The members of the regional, and in turn, the members of the state and local committees were as representative as they could be of the different elements of marketing in the territory. I had occasion to have very frequent contact with those sub-committees in connection with the work.

At the beginning of the Code there was without exaggeration a tremendous amount of work. The Code was sorely needed, but there were many questions of interpretation, misunderstandings and complaints as to conditions. Much had to be done to bring about an understanding of the Code rules and their effective application in the industry to establish fair marketing practices and give relief from the many disturbances that the industry had been suffering from. This involved a great deal of work in Washington, particularly in the early stages. It also involved considerable traveling through other sections of the country and working with the committee in the field. Those activities continued until the end of the Code, May 27, 1935.

3162 I received Exhibit 891 for identification, a letter dated July 20, 1934, addressed to me and signed by Mr. Ickes, Administrator of the Petroleum Industry. After I received that letter, I took on other activities. These activities involved the organizing of a general stabilization committee in Washington, with a complete field organization, with headquarters in the same divisions in all of the states; in many cases in local towns, and in some cases in respect to individual difficulties. I appointed the members of the general stabilization committee in Washington, and appointed chairmen of the committees in the respective regions. The regional chairmen appointed state and other committees. It was all under the advice, however, that these committees be even more embracive, if possible, of the different elements in the marketing end of the industry, that being a very essential part of those committees. These activities I have spoken of in connection with this letter of July 20 continued until the end of the Code, May 27, 1935.

In the beginning of this period my activities under the Planning and Coordination Committee and the marketing committee and under the letter of July 20th took almost all of my time, and eventually all of it. I arranged, in view of those activities, having in mind how pressing and important they were, that my duties as president of Socony-
3163 Vacuum Oil Company be taken over by the executive committee of Socony-Vacuum Oil Company. I was not a member of that committee. I resigned my position as president and became a vice-president and director of the company.

The Planning and Coordination Marketing Committee had its offices in its own quarters in Washington, and that was where I was located. I also occupied my office at 26 Broadway, and carried on my own responsibilities there when I was in New York. That was true in connection with my work under the letter of July 20, 1934.

After the discontinuance of the Code and stabilization, I devoted myself to the preparation with the industry of a new marketing code to be submitted to the Federal Trade Commission. I was and am a member of a committee on that matter. The committee is composed of three members: Mr. Schuh, who is president of the National Retailers Organization, which has a membership among retailers of the country; and Mr. Paul Hadlick, who is head of the National Oil Association, I believe it is called, which is a national association for jobbers; and myself as chairman.

I heard Dr. Frey's testimony. There were numerous local committees, such as Dr. Frey referred to, active in many areas all over the country. The activities of
3164 the various committees reached practically every important place in every part of the country east of the Rocky Mountains. I agree with Dr. Frey's statement that there were problems which related to general areas, and in dealing with those there were stabilization meetings in particular areas and regions. General meetings such as I have described were held in the Mid-Western area, that is, the states included in the so-called Standard of Indiana territory.

On January 4, 1935, I attended a meeting which Mr. McDowell has described as a stabilization meeting in Chicago. I called and presided at the meeting. In opening the meeting I called attention to the group of very important prior meetings over a period of some 4 or 5 days, in early December, dealing with the restoration of retail markets.

During those four or five days over 1100 or 1200 people came in from the mid-western states, representative of the different kinds of marketers, to deal with this matter.

I spoke of it. I pointed out that a great deal had been accomplished at that meeting, but that there were already indications that the gains that we thought we had brought about were not holding, and that I felt that unless we did realize that we had to devote ourselves to carrying
3165 on this effort in respect to the stabilization and bringing back to normal of the retail markets, we would soon be back to where we started.

By many different kinds of marketers I mean there were the refiners, large and small, and representatives of dealers, jobbers, what we called the trackside operators, and the open price-cutters. In fact, the various types of marketers that are so vitally interested in retail markets.

I told them what had been accomplished. I called attention to the fact that while a great deal had been done at that December meeting where we made some improvement in some 800 or 900 circuit points, and while that was undoubtedly a fine step, yet there were still other points that nothing had been done with, and it still had to be remembered that there was much to be done, and that the situation did call for their very careful consideration and action. I spoke of the price wars that had been so prevalent throughout the territory in the Mid-West. At that time, as everybody knew, they were evident in most every place, and they were something of great concern and were growing even more evident most everywhere.

The subject of price wars, and how they operated, is very important. It involves a great deal. I would 3166 like to picture to you as simply as I can some very important phases of price wars.

First, let us take any one of the important major companies and deal with their distribution. Those companies find it very necessary, in order to have what they consider proper representation, where the product will be on sale, where the customers want it, to have circles or we will say circuits, if you like, tank wagon circuits. Those circuits may have one, two, three, or more towns. They are fairly limited. Those circuits are very sensitive to the competition in that circuit.

If at any time there is anything to disturb a market in one of those circuits and there is some change or reduction in price at the retail point of sale or the service station, everyone operating in that particular circuit meets that change, that reduction.

Now, the important thing about that is that the circuits of one company may not be the particular circuit of another company, so that the circuits overlap, and so the minute there is any change in a given circuit other circuits are very quickly affected.

And so starting with one, you have immediately to deal with 5 or 6 or 10, or more points.

It is not an uncommon thing by this method that what happens at one point may spread rapidly, very frequently more rapidly than it can be dealt with, to an entire 3167 state.

I know many places, and I have in mind now a town like Atlanta, Georgia, where by the operation of one man in one town, the entire state was kept in a state of subnormalcy for nearly a year just for this reason.

Very outstanding in that picture and frequently the cause of these price wars, is the operator who undersells openly.

He is not a secret rebater or a secret-price-cutter. He is known in the industry as "known price-cutter." He is the trackside operator. He is the cut-price operator. And that is very important in these Mid-Western states, because operators find it to their advantage, with good up-to-date stations, and grades of gasoline frequently better than those they are competing with, to enter into markets as known and obvious price-cutters. Their prices may be 2¢, 3¢, 4¢ and maybe 5¢ under the normal market.

In any one of these circuits if any such price cutter makes a move because he wants more gallonage, that move is immediately met. During the period we are speaking of, that was a very outstanding form of competition, a very obvious one, and one with which the whole industry was concerned.

I say "immediately"; not always immediately because I can remember that there are occasions when
3168 such price-cutters would make a substantial price cut
of 3¢ or 4¢ and that the industry would hold to a normal price or to the then prevailing normal price, and not make the change. The result was a vast falling away of gallonage from the normal station of the refiner into stations of these price-cutters. Now, that, I may say, is a serious thing, and one that everybody in every one of these circuits had to contend with. It couldn't go on indefinitely, because by that method any station that was competitive with such a price-cutter would soon lose his position. So, sooner or later he might be compelled to meet that difference in price, and frequently when that price was met, the so-called price-cutter, to maintain his position, and accomplish what he was trying to do, would make a further cut. So you were where you were in the beginning, except at a lower level.

Now, I would like to speak of surplus gasoline, which is very important in connection with these price wars.

For illustration, say we in this room are price-cutters and we go out and see several hundred cars of gasoline on the track-side. And we say, "Here is gasoline that has no market; it is gasoline that we might buy. Shall we buy, or shall we not buy? If there is any inducement to buy, let's see if we can buy."

3169 We would see if we could buy it at a bargain. We
might buy it direct from the refiner or through a broker; in any event, we would be interested in buying it, because it would be distress gasoline available at a good price.

Sometimes the gentleman in the other end of the room, who might be the larger refinery, might also see that gasoline; he might be interested as a buyer of gasoline, and whoever bought it, it would be bargain gasoline.

While that is going on, what is happening to this retailer?

The retailer has a margin between what is the normal price and what he pays, and he has to operate and make his profit within that margin. If he becomes involved in a price war, and has to meet his competitor in any one of these circles, he has to give away part of that margin. And when he gives it away, and again gives it away, depending on how the price war goes, he comes down to the point that that margin is reduced and reduced and reduced. And, sooner or later, he comes to the point—that was so frequent with us—he came to the point that he couldn't go on; the margin wasn't there.

And then what did he do? He turned to his supplier. He turned to the refinery, or the jobber who sold him
3170 his gasoline. That jobber may be the large refiner's jobber, or it may be the jobber of the small refiner. And he pointed out that, "I must have assistance because, see what this price war has led me to." And then in turn, the jobber, who would have to help him or lose his distribution or his retailer—he had his margin, and as he helped his distributor or his retailer, he had to give away part of his margin. And it would not be very long before he would have reached the point where he didn't have sufficient to carry on. And so he, the jobber, turns to his source of supply. Or he has a refinery he is distributing for, and so he goes to this refiner.

Does the refiner then say that he is not interested in his jobber, or his distributor? No, he takes care of that jobber; and refiners do take care of their jobbers, because they depend on them. And so that refiner eventually finds himself an important cog in this price war—a price war started by the retailer, and involving all, the retailer, the jobber, the trackside operator, the price-cutter, the co-op, all involved in that retail price war, which comes back to the jobber; and the jobber then goes for protection or help to the refiner; and the refiner then has to take care of it. And by that means he gets a realization—a realization of what? Whatever the price war has brought back to
3171 him as a tank car price.

And so we have a circle that starts again when that very refiner, who has sold that distress product, in turn has to go out and sell again, with no known market or known customers; and gasoline appears again in the retail market, with more or less the same effect.

This process involves the marketers and refiners so that each and every one of them become price-cutters and involved in a price war, that starts at that retail station in any one of these circles, and which, I have explained, can spread so rapidly in all directions.

These were the problems I was very actively dealing with in the winter of 1934 and 1935.

There was more than one subject discussed in the course of the meeting of January 4th. My uniform practice in conducting those meetings was not to prepare agendas of the subjects that I wanted to talk about but to find out what the industry wanted to talk about. The subjects that were the most serious in the minds of the industry at any point were the things that they presented and which we offered to the meeting, as they cared to discuss it. These matters were generally sent in to Mr. Majewski. He lived in Chicago, where we held most of our meetings. He would list them as they came in. When we had our meetings, we would then call out the subjects and let those that were present deal with the subject that they desired to deal with.

3172 I remember the procedure that was followed on the occasion of this meeting of January 4th. The matter which resulted in the appointment of the Tank Car Stabilization Committee was taken up in the latter part of the morning session of the first day. Mr. Majewski, who was a member of the Planning and Coordination Marketing Committee and of the Stabilization Committee and who represented the independent refiner and the jobber in these Committees, arose and said that he had something that, to him, was of the greatest importance.

He stated that he had listened to what had been done in regard to the restoration of retail markets, and was most pleased and gratified that progress was being made; because he realized how important it was. But he had not heard anything in regard to the question of the independent refiner, and that concerned the realization of gasoline by that refiner.

He stated that this question had been a matter of consideration by the Petroleum Administrative Board and the Planning and Coordination Committee ever since the Code had started. That he knew and was aware of what had been done on various occasions to bring help to the independent refiner, but that very little had been accomplished.

To the contrary, the independent refiner had reached
3173 the time when his situation was more serious than it had ever been; and, much as he regretted it, that something would have to be done, and if it could not be done, it would be necessary in protection of their interests to withdraw from the observance of the Code, to have no further part in stabilization, and to go out and in their own way endeavor to protect themselves. That he hoped that something could be said at the meeting that would give him some relief in the concern that he had for the independent refiner; and he hoped that they would realize that this was nothing more than really a cry of distress that he felt just had to be dealt with.

He said that, with the stabilization or the fixing of the price of crude oil, the independent refiners had been faced with a serious problem. That they had endeavored to change the price of crude oil to get some relief, but the Administration had been most insistent and had definitely shown that their policy was to maintain that price; and that in consequence, there was no alternative for them but to see the realization of gasoline far below that parity, which affected them with regard to all their operations; and it would not be very long before some of the refiners would have to close their plants. In fact, some of them, he reported, had already closed.

3174 After Mr. Majewski talked there was a great deal of discussion from the floor with regard to the subject matter of his remarks. I recall some of it. There was a response from a great many people on the floor. It was a general discussion. I don't know all who rose, but the substance of what was said was that all refiners were in a serious predicament, and that what Mr. Majewski said was a matter of very deep concern, and was no doubt of more concern to the independent refiner than it was to the larger refiner, because it meant his very life; and if something wasn't done, no doubt they would, as Mr. Majewski had stated, be in a very serious condition.

Some of the gentlemen pointed out that one of the contributing factors to the distress was the sale of high-octane by some of these refiners, who were offering it in competition with much lower octanes, that they felt that there was a justification for what had been said, and that something ought to be done.

There was another independent refiner who participated in the discussion. That was Mr. O'Shaughnessy, head of the Globe Companies. He was a member of the Planning

and Coordination Committee and was active in stabiliza-
tion as representative of the independent Mid-Conti-
3175 nent refiner. He is a defendant in this case, on trial now.

Mr. O'Shaughnessy stated with emphasis that he concurred in what Mr. Majewski had said. That he had been definitely of the opinion that crude oil should come down. That he had taken that position with the Administration; in fact, at one time he had reduced the price of crude oil with some other refiners, but had restored the price because he felt that it would be better, and the Administration wanted to keep the price of crude oil at one dollar; but that he had reached the point, notwithstanding all that, where he would have to concur with Mr. Majewski, and maybe they would have to reduce the price of crude oil anyway; something would have to be done, and it might have to be that.

I didn't take any part in the discussion. At its conclusion I made some remarks. I stated that I felt very sympathetic with what had been said; that it was no doubt true that we had, with the Petroleum Administrative Board, struggled with the plight of the independent refiner. That the independent refiner paying $1 for crude and with the additional wages, and reductions in hours, and with his allocations and other things, that had come to him, unquestionably was in a very serious situation; and I quite agreed that if something could be done, it ought to be. I asked
for recommendations from the floor as to what, if
3176 anything, could be recommended.

I said something as to the effect on the retail market if the tank car market were not stabilized. I stated that what we had done in December in respect to the restoration of retail prices would unquestionably not be of any account; that, unless something was done to deal with the tank car market we would continue to have trouble, and I felt that that was a very important item.

I was here throughout the testimony of Dr. Frey, and I heard him testify that the Secretary considered that it was an undesirable state of affairs for the price of gasoline at the refinery not to be in parity with crude, and it was particularly hard on independent refiners.
